

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

MAJA

THE SISTER
OF
MERCEDES

THE SISTER
OF
MERCEDES

Pronounced "My-yah"

Is the latest improved product of the Daimler Motoren Gesellschaft, makers of the Mercedes Cars, named by Herr Jellinek for his daughter, Miss Maja Jellinek, just as he named his earlier model for Miss Mercedes Jellinek. The Maja Motor is the simplest, most powerful for size, and the quietest in the world, exhibiting features that will as surely advance the art of motor car making as did the previous revolutionary productions of these famous Works. For 1908 these advantages are to be had only by using a Maja Car. The Maja Car is placed within reach of all lovers of good automobiles by marketing through direct branches of the parent Company, avoiding all middlemen and agents, charging one normal profit over the expenses of manufacturing, whereby the most costly models the Daimler Works have ever made become the lowest in price to the purchaser. Full particulars from the

Importers Display Foreign Cars in Artistic Style

CREDIT for the most artistic setting of any automobile show held in New York this or probably any other year must unreservedly be given to the exhibition opened in Madison Square Garden on Saturday, December 28, by the Importers' association. Though officially designated the "Fourth Annual Importers' Salon," it is somewhat difficult to understand how the event can claim to be in more than its second year, the only other independent exhibition having been held with small success on the upper floor of a department store. Both New York shows, in which the Importers had taken some part in past years, were this season held so early that it was impossible for the foreigners to secure their new models in time for exhibition. By agreement with the Association of Licensed Automobile Manufacturers, which has an option on Madison Square Garden, the Importers were offered the big building from December 28 to January 4, and so another attempt was decided upon to attract the attention of the public on independent merit.

Frankly, the Importers have succeeded in what was avowedly a difficult position, the spectacle revealed to the public when the doors of the Garden were thrown open at 8 o'clock on Saturday night last being an agreeable surprise. In place of the Garden of the busy A. L. A. M. show an entirely new scene had appeared, the big amphitheater being transformed and decorated as probably it never had been before. The extra space available through the comparatively small number of exhibits gave the decorators an opportunity they have not failed to take advantage of, the big hall being treated in a manner that would hardly be possible with a more compact tenancy. Under the canopied ceiling an artistic decorative scheme in French renaissance style has been carried out with an attention to detail that leaves little to which the critical can point a finger. A central alley flanked by two side avenues, all terminating in a luminous fountain supposed to represent a scene at the Park Monceau, Paris, forms

By W.F. Bradley

the general scheme of the outlay, cars being displayed at their stands down these three alleys, and the first gallery given over to accessory exhibitors. The upper gallery supplies a promenade from which an excellent view is available of the scene below. The arena space is a decorative wall reaching to an elevated platform at the back of which rises a series of arches as high as the upper gallery, surmounted by open panels decorated with coats-of-arms at the edge of the roof. Except a deep blue sign showing the name of the firm, the column supporting it having a luminous base, there are no stand decorations, yet the lighting is of such a satisfactory nature as to throw out in best relief the models on show. The concert hall forms a tea garden with natural flowers as decorations.

From the standpoint of business transactions there is more room for diversity of opinion than regarding the general decorative effect of the show. Decorations will attract crowds, but decorations alone will not sell cars, and it is by this latter standard that every exhibition must finally be judged. Opening with a very thin house, the attendance during Saturday evening gradually increased until at 9 o'clock, though the hall was not crowded, there was an entirely satisfactory attendance, the foreign chauffeur element no longer being in a majority.

A Select Number of De Luxe Builders.

Eighteen firms were represented in the Garden at the opening hour: France supplying ten, Germany three, Italy three, England and Switzerland, one each. Darracq and Itala, both announced as exhibitors, were not to be found, but Züst and Benz, whose names had not appeared on the original lists, were represented by a car each. Though all the models were announced to have been imported direct from the Paris show, there are three or four cases that look suspiciously like 1907 models painted to resemble the models of the coming season.

Those who had received new cars have in several cases been unable to get all their most interesting models over in time, as for instance, on the Delaunay-Belleville stand, where the smaller six-cylinder car, with its cylinders in two groups of three—one of the novelties of the Paris exhibition—is not to be seen. Dietrich's chief novelty at the Paris exhibition, a shaft-driven town vehicle, is also a missing quality. Renault, on the other hand, possesses a most complete line, which if not including every type of vehicle built at the Billancourt factory, at any rate comprises all those of interest to an American public, and that is saying a great deal.

It was not to be expected of an importers' exhibition, working under a 45 per cent. import duty, that popular vehicles would be in evidence to any extent. Practically all the cars shown are powerful models with a respectable number of figures attached to their names on the price lists; a limited exception is to be found in the town vehicles of half a dozen firms, with a power rating at something below twenty. In the examples of body-work, too, shown by three American makers, the same high-grade article is exhibited of a nature to interest only those able to pay for the best.

Show Does Not Indicate Trend of Design.

Being a trade exhibition pure and simple, the Importers' Salon is valueless as an indication of the trend of design or methods of construction of any country; even the ten French firms, important as they are, cannot claim to adequately represent their

country's national industry, and the same is true to a greater extent of the models shown from Italy, Germany, Switzerland and England.

Special chassis for town work form the outstanding feature of the exhibition, widely differing but interesting models being shown by Panhard, C. G. V., Fiat, Hotchkiss, Renault, Maja and Delahaye. A low, side entrance body, easy steering, turning and control, and a silent engine are in general the features which European constructors have set themselves to develop for the special types of gasoline cars which in their own countries have almost driven out the electric as a town conveyance.

With the exception of the little Delahaye, fitted with a two-cylinder engine, all the town vehicles have four-cylinder engines, and all without exception have final drive through propeller shaft and rear live axle.

There is an interesting example of casting *en bloc*, so popular with makers of town vehicles desiring compact power plants, in the new 16-20-horsepower Hotchkiss, which Manager J. J. Mann, foreign technical adviser to the A. A. Racing Board, had brought over with him from Paris and was never tired of explaining to visitors. With valves on one side, all piping, both inlet and exhaust, has been cast as an integral part of the engine, the exhaust being arranged in such a way that on looking at the engine it is at first difficult to see what becomes of the spent charges from the engine. This is explained by the fact that the inclosed exhaust pipe opened at the rear of the last cylinder, the piping passing through the dashboard and connecting immediately to the engine. The arrangement of the inlet piping, or rather its absence, is a distinctive feature, the only connection being a short length of pipe from the carbureter to the engine. As the carbureter is on the opposite side to the valves, the charge is led across and distributed to the valves by internal piping. The consequence of such an arrangement is an extreme simplification of the engine, the water inlet and outlet and metal casing containing the wires being the only piping. It is interesting to note that unless specially ordered the Hotchkiss people no longer fit ball bearings in the engine, the abandonment being rendered necessary owing to careless handling on the part of inexperienced or careless drivers and owners.

The only other example of four cylinders in one casting is in the C. G. V. town vehicle, where valves are also all on one side, but in which more standard design is followed. A feature, however, is an asbestos-lined metal casing around the exhaust manifold.

Self-starter on Renault Town Car.

Renault presents no particular model which by reason of outstanding features can be termed a town vehicle, there being a close similarity in points of construction between the smallest and the largest of the cars built by this firm, but the 10-14-horsepower four-cylinder model possesses such qualities of silence, flexibility and compactness as to have earned for it the title of Queen in its class. No distinctive changes are noticeable on the engine of this model, the cylinders as before being cast in pairs, with valves on one side, magneto in front, and tubular radiator on the dashboard.

Among the new features of the chassis will be immediately noticed an additional pedal to the left of the clutch pedal, by simply depressing which the motor can be started up from the seat. An attempt to solve the problem of self-starting was presented by Louis Renault at the Paris Salon two years ago, the device of that date having but little in common with the arrangement now in use on the smaller Renault cars. All the mechanical parts connected with the self-starter are contained in a compact metal case mounted on the gear box, in such a way as not to interfere with the opening of this organ. The arrangement appears to be eminently simple, necessitates no change whatever on the engine, and should have a longer reign of usefulness than some of the self-starters which, conspicuous on 1907 models, are absent on the corresponding models for 1908.

Copyright, 1908. The Pictorial News Company.

Three-quarter elliptic springs are to be a feature of all Renault four-cylinder models for 1908, and wherever desired patent shock absorbers designed by Louis Renault will be fitted front and rear. Since the adoption of three-quarter elliptic springs the rear construction of the chassis has been slightly changed, the broad angle stays being abandoned for smaller semicircular binders, having a much neater appearance. The new type of suspension is declared to be more steady, to cause less rolling with heavy bodies and to twist the chassis less than the platform type, which was formerly a standard feature.

Panhard's Shaft-driven Car.

Panhard's first shaft-driven car—other than racers—is too solidly constructed for its usefulness to be confined solely to service over well paved town streets. Yet it has been designed especially to meet the demand for a silent car suitable for work in cities. The car is an entirely new production, departing considerably from Panhard practice in both engine and transmission. The four cylinders are cast separately and are approximately 3 1-2 by 5 1-8, rated at 15-20-horsepower at 1,300 revolutions.

Most prominent in the engine design is the sliding exhaust valve camshaft operated by a foot pedal; by means of which the engine can be used as a brake. The same arrangement is to be found on the larger models, thus giving for Panhard cars three independent sets of brakes. Both camshafts are contained in the upper part of the crankcase and are removable from the rear by disconnecting a detachable disk. Gear set and multiple-disk clutch are contained in one housing set rather more to the rear than usual. The engine flywheel is fitted with fan blades, and the main shaft from the engine to the clutch is equipped with an intermediate bearing. Owing to the position of the gear box, an exceptionally short propeller shaft is necessary to carry the drive to the rear axle; a steel sleeve bolted to the differential casing at the rear and attached to a cross member forward by forked arms and spring suspension, surrounds the propeller shaft and acts as a torque rod.

An unusual form of pressed steel frame is shown in the Fiat shaft-driven town vehicle, the side members being deeply dropped to give the lowest possible entry, the face of the frame considerable broadened as it leaves the sweep, and narrowed in front to give a wide steering angle. The rear axle casing, too, is distinctive in consisting of a two-piece stamping bolted longitudinally. Delahaye displayed the only two-cylinder cars in the exhibition, two models being on view, one a cab complete with taximeter as used by the New York Transportation Company, and the other a similar chassis with a more elaborate cbody.

Sizes Are Only Moderately Numerous.

Among the larger models shown at the Garden the greatest novelty is undoubtedly the six-cylinder Renault with automatic self-starter. When the show opened the six was the only vehicle not in place. An hour later its appearance was announced, and in almost less time than it takes to tell Bernin had climbed up behind the steering wheel, steered the car to a position on the stand, and workmen were busily removing the effects of sea water on the unprotected parts.

On this model as well as the larger four-cylinder cars a compressed air self-starter is fitted as an extra wherever required. The device consists of an air-cooled pump on the forward end of the engine, driven off the distribution gears, and compressing air into a metal tank hung within the frame. All the control of the apparatus is fitted to the right hand side of the dashboard, the operation of a small lever here allowing the air to pass from the tank to the cylinders through a rotary distributing valve. Use can be made of the compressed air for tire inflation purposes, by a Michelin outlet and pressure indicator attached on the dashboard. Two bolts only, held in their base by swivel joints, held the pump in position, dismounting being thus the

PROTECTION AGAINST THE WEATHER, A LA ROTHSCHILD.

simplest operation. Altogether the design and workmanship of the self-starter is a production calling for unstinted praise.

In all essential features the Renault six is merely a case of adding another unit to the four-cylinder engine, transmission, drive, suspension and other features being similar with the exception of strengthening for the extra load that the car is intended to carry. In addition to the several chassis shown on the Renault stand, a number of cars were displayed with handsome closed bodies, and the racy runabout which established a new track record at the Morris Park twenty-four-hour race has a place of honor.

Hotchkiss, Fiat, Delaunay-Belleville, and Rolls-Royce supply the remainder of the sixes at the Garden, Delaunay-Belleville having the cylinders cast separately, Rolls-Royce with two groups of three each, and the other with castings in pairs.

Rendering the Engine More Accessible.

Refinements in detail which render an engine more accessible or simplify the care of a car are probably no more carefully thought out on any vehicle than the Delaunay-Belleville. Securing the magneto on its platform by means of an encircling band is too common a practice now to call for much comment; in the Delaunay-Belleville models not only is the magneto secured in this manner, but the pump, carried on the opposite side of the engine, has a similar method of attachment. After disconnecting the two lengths of piping, all that is necessary to dismount the pump is to unscrew the band attachment and lift it off its pins. All the electric cables are contained in metal tubes, which instead of being attached permanently by screws are held to the water piping by spring clips; thus the magneto and all cabling can be dismounted in a few seconds without the use of tools.

Benz, Züst and Maja constituted a trio which might be regarded as newcomers, though all have an excellent reputation

AN EXCELLENT EXAMPLE OF THE USE OF ALUMINUM FOR BODIES.

on the other side of the Atlantic. Maja is newer in name than in deed, for the newcomer is a member of the Mercedes family, marketed direct in America by a separate company, but built very largely on the well-known Mercedes lines. One distinctive feature is that either shaft or chain drive will be supplied to order on the two models now on the market.

Carriage Work Reveals Good Native Talent.

In body work American firms occupy a larger share of space than the foreigners, most of the chassis from abroad being equipped with bodies made in this country, principally by such well-known makers as Rothschild, Quinby, and Brewster. The credit of the biggest body belongs to the Delahaye stand, where

RENAULT SIX-CYLINDER CHASSIS WITH AUTOMATIC SELF-STARTER.

HOW THE SELF-STARTER AND TIRE INFLATOR ARE CONTROLLED.

a rear entrance saloon car is shown, fitted with four armchairs and a couple of writing cabinets. The car is excellently upholstered, fitted with electric light, electric annunciator and every luxury usually only associated with the most comfortable rail-road travel.

Apart from this, all the bodywork is more marked for excellence in workmanship than eccentricity in design, houses on wheels not generally being a great success even on the best roads of Europe. Two or three cases were noticed where the rear seat of a touring car was divided into either two or three, in the same way as is commonly done for the front seats. A Flandrau body on a Pilain chassis is a good example of this, other improvements on the same car being footboards which can be

raised to any desired angle, and folding seats attached to the side of the tonneau by a single slot and pin without the use of a leg for the seat. There is a tendency on the landaulet bodies to provide protection for drivers, at present left fully exposed to the weather. This is accomplished by a neat folding hood to lie near to the closed body when not in use, extending outward as far as the dashboard when opened.

A distinct novelty in the covering of an open touring car is shown on an Isotta-Fraschini with a short top with only one side bow, extending forward as far as the back of the front seats. The driver is protected by a Huillier windshield, swinging at the top, and connected to the dashboard by a leather apron. Between the hood and the shield a waterproof leather cover can be buttoned in position, completely protecting both passengers and drivers. With such an arrangement the protection afforded would not be equal to that of a car with a large cape top, but would still be sufficient to keep off heavy rain and have the advantage of adding little to the weight of the car and of being easily stowed away.

As an example of what can be done with aluminum in the construction of high-grade carriage bodies, Rothschild displays a limousine in an unfinished condition built exclusively of this metal, the use of which has allowed a minimum of joints impossible with any other form of construction. There were numerous other examples of aluminum body construction, though none that equaled this for the employment of large sheets of metal without seams, or that revealed so perfectly what can be done with this metal. Carriage work was invariably of the highest grade, a feature of the finish being the employment of subdued tones and the dull finish of much of the metal work hitherto conspicuous for its glitter.

Accessory Display Is Largely a Repetition.

On the mezzanine floor, accessory dealers hold their usual display of the thousand and one articles useful if not always absolutely necessary to the running of an automobile. In the majority of cases these have been exhibited at the preceding shows in the Garden or the Grand Central Palace and provide little in the way of novelty.

Merely as a means of drawing attention to a well-known article, the use of a couple of small wagons at the Truffault-Hartford shock absorber stand is novel and effective. One of the little vehicles is fitted with shock absorbers, the other is not. Each one is placed over a revolving drum with a raised leather band across its face, and nothing could better exhibit the value of the shock absorbing device than the relative behavior of the two cars when the drum revolves.

A new force-feed oiler, patents for which have been obtained in all foreign countries, was shown by the Geo. Wood Manufacturing Company. The features of the instrument are the positive flow of oil and the extreme simplicity of all the parts, as an example of which may be mentioned the entire removal of all the plungers on the withdrawal of three screws. Driving the oiler in a reverse direction, no matter at what speed, could not possibly injure it.

In the tire realm one of the few novelties is a dismountable rim introduced by the Healy Leather Tire Company. Unlike the majority of quick-change devices on the market, a double rim has not to be employed, the dismountable rim attaching direct to the spokes of the wheel by means of patent clips with a screw for each. The advantages are a saving in weight, a dismountable rim of the Healy type being no heavier than an ordinary wheel, the impossibility of binding, for two metal surfaces are not brought together, and the retention of the ordinary valve and safety lugs. It should be possible for any ordinarily experienced person to make a change of rim by the Healy method in three minutes, the operation being the simple one of slackening a nut at the end of each spoke, changing the rim and tightening up again. The only tool required is a screw brace.

Arctic exploration being the order of the day, the Healy peo-

Copyright, 1908. The Pictorial News Company.

A FEW RELICS FROM THE EARLY DAYS OF THE CENTURY.

ple have adopted a steel-spiked rim to their new device, the Arctic aid being a steel rim to take the place of the tire rim, its face instead of being grooved for the tire, being studded with projecting steel spikes, certain to find a hold on any frozen surface.

The Locomotion of the Ages.

Madison Square, like Paris, has its retrospective exhibition, the home event comprising four units: an ancient Dietrich; an equally venerable Panhard, with a true tonneau such as no modern dealer could supply on request; a Renault racer, which figured in the Paris-Madrid of 1903; and a four-cylinder Rolls-Royce, which bore a very close resemblance to the car with which Rolls won the Tourist Trophy race in the Isle of Man.

Taking another lesson from the note-book of the Paris exhibition, the Importers organized a spectacular fête on New Year's eve, the subject of which was locomotion throughout the ages. Going back to pre-Adamite days, the parade, led by a band, showed the first stage of locomotion in the form of a monkey on all fours. Man walking on his hind legs came as the natural successor, an oxen following next in the stage of development. After this slow and ponderous beast, came each in its order, the representatives of the transportation of the ancient civilization of the East—Hindoos bearing a palanquin on their shoulders, the sprightly Jap dragging the forerunner of the buggy behind him in the shape of the jinrikisha, and then the first of the swift four-footers, the Egyptians, Romans, and Greeks in their chariots, and again a retrogression, so far as speed was concerned, in the shape of the elephants of the Persians, and the European sedan chairs, followed as a wind-up of this part of the procession, by donkeys and horses drawing the first fourwheelers.

HOW CONNECTION WAS MADE FROM GROUND FLOOR TO GALLERY.]

Then came the age of steam, represented by an engine, and the next step in the form of a bicycle, while following closely upon its rear wheel came the final triumph of modern genius in the field of locomotion—the automobile, with old Father Time driving a replica of the first automobile, while its modern successors were guided by the "Spirit of 1908."

The pageant solemnly filed round the aisles of the Garden during the witching hour when all the outside world was welcoming the New Year in an ecstasy of noise, but the novelty of the procession and the interest it excited made it a drawing card on New Year's day, when it was repeated at 4 o'clock in the afternoon and again at 9 o'clock in the evening.

The brunt of the labor in connection with the highly successful Importers' show naturally fell on the show committee, consisting of André Massenat, E. Lillie, E. R. Hollander and General Manager C. R. Mabley, though others connected with the display comprised J. S. Josephs, president; C. F. Wyckoff, S. B. Bowman, Paul Lacroix, Gaston R. Rheims, Percy Owen and Geo. M. MacWilliams. Credit for the excellent decorative effect, which has aroused universal admiration, is due to S. R. Ball. Naturally numerous conjectures have been made as to the cost of what is undoubtedly the finest decorative scheme seen at any American automobile show, \$60,000 being quoted in very authoritative circles. As it is intended, however, to dispose of almost the entire effects to the promoters of a succeeding show, the final cost will doubtless be considerably lower than the figures quoted. Though this first real show independently fostered by the Importers cannot be put down as being other than a great success in many ways, there is a more or less settled conviction that it is the first and last of its kind to be seen in New York.

RENAULT POSSESSED ONE OF MOST COMPLETE EXHIBITS IN SHOW.

BREWSTER BODIES ON SOME OF THE FINEST FRENCH CHASSIS.

MARCAI DIVIDED AIRSHIP. WITH PROPELLER AMIDSHIPS BETWEEN TWO HALVES, SHOWN AT GALERIE DES MACHINES, PARIS.

PARIS, Dec. 23.—A dirigible balloon with its propeller in the center is an aeronautical novelty attracting the sky navigator to the Galerie des Machines, Paris. Baron Edmond de Marcai and a Dutch engineer, M. Kluytmans, have produced the new ship with a view to overcoming the lack of stability which is generally found in vessels of the *Patrie* and *Ville de Paris* types as soon as the propellers are put into operation. In the former class the double propellers revolving at 1,100 revolutions a minute are carried below the envelope in the center of the cage; in the latter class a single screw turning at 140 revolutions a minute is carried at the forward end of the cage. Removed some twenty or thirty feet from the center of the balloon the defects of the two systems are apparent in a strong wind. To overcome the difficulty, compensators have been employed with considerable success, and naturally the lines of the ship influence in no small measure, but when all has been done rolling is the *bête noire* of the aerial sailor.

The Marcai airship consists of a couple of long sausage-shaped bags placed end to end and having a connection through the center of their axis, in order to equalize the gas pressure in the two compartments. The propeller is attached to the frame in the center of the balloon, its two arms describing a circle of larger diameter than that of the balloon. The motor is carried on an under frame below the gas bag, transmission being by means of a long belt. Experiments made in the Galerie des Machines, the balloon being guided along by a rope, were thoroughly satisfactory. As soon as possible outdoor experiments will be undertaken, for as the propellers have been arranged to improve stability it is only by trials in a wind that their real worth can be determined.

Aeroplanists Busy Training.

PARIS, Dec. 23.—Santos Dumont is busy on *The Butterfly* No. 19, although No. 18, a water craft, has not yet fulfilled the mission for which it was created. The latest edition of *The Butterfly* is a modification of one which appeared at Bagatelle nearly two months ago without much success. Instead of a single propeller forward, it has been reconstructed to provide two separate propellers of bamboo frame covered with silk, both at the forward part of the machine, and driven by a round belt. The motor retains its original position in the angle of the two wings, made of bamboo frame covered with varnished silk. The method of transmission, with which Santos Dumont is said not to be altogether satisfied, is

somewhat unusual, a crossed belt running from the flywheel of the engine to a bicycle wheel with a grooved face, to which is attached one of the two-bladed propellers; the companion propeller is driven by a connecting rod from the belt-driven wheel. No other changes appear to have been made in the construction of the aeroplane, the machine being one of the lightest and smallest ever seen on a testing ground. What it is capable of doing under practical conditions has not yet been determined, for on the first day that speed was attempted the belt came off and broke one of the propellers. It was not a serious accident, but several days will pass before another run can be made.

Henry Farman, unlike his principal rival, remains true to one machine, but loses no opportunity of training both himself and it for the kilometer flight in a circle. Bad weather has hindered the attempts of the last few weeks, but on every occasion on which it has been possible to be out he has made attempts at flight. During the past week he has made a number of flights varying in length from 300 to 400 yards with ease.

Louis Bleriot, in an attempt at Issy-les-Moulineaux to capture one of the club prizes for a 150-meter flight, was exactly five meters short of victory and a shorter distance of meeting his death. An excellent flight had been made in the presence of the Club Committee, which terminated so successfully that all thought the prize won. On measuring the ground, however, it was discovered that the flight was five meters short of being up to standard, and a fresh attempt was begun without delay. The second flight, made at three yards from the ground, was apparently successful, but on descending, the left road wheel collapsed, the wing scraped the ground, and in a second the aeroplane had capsized. The committee, followed by Madame Bleriot, who was on the ground, rushed to the spot and withdrew the skypilot with some difficulty, happily uninjured except for a bruised shoulder. His machine, however, was badly damaged, the propeller and shaft being broken and the wings injured. The Antoinette motor, however, was in perfect condition. Bleriot, though possessor of some of the most promising aeroplanes, designed and built by the best makers, has so often met with accidents when success seemed certain that his ill-luck has become proverbial among French aeronauts.

The Ferber-Antoinette aeroplane, designed and built by the maker of the celebrated light weight motor, has reached completion and is expected to be tried out as soon as weather conditions are satisfactory. The motive power is a 100-horsepower 16-cylinder Antoinette engine.

CENTRAL PROPELLER AND MOTOR.

SANTOS-DUMONT'S BUTTERFLY AS IT APPEARS WHEN FITTED WITH TWO ADDITIONAL BELT-DRIVEN PROPELLERS.

FARMAN WILL CELEBRATE NEW YEAR FLYING.

Henry Farman is again ready for an attempted flight of a kilometer in a closed circle, the accomplishment of which will entitle him to the Deutsch-Archdeacon prize of \$10,000, according to dispatches received from Paris. On Monday afternoon at the Issy-les-Moulineaux drill ground, near Paris, Farman brought out the aeroplane which he has employed for the past few months, but which has recently undergone some minor improvements, and almost succeeded in accomplishing a record flight. After running on the ground for a couple of hundred yards, the machine shot into the air and traveled to the extreme end of the open ground, at a height of about three yards. Farman then operated the rudder and began a difficult turning movement, which, when about half accomplished, was spoiled by a group of workmen getting into his path. To avoid hitting them the aeroplane had to be suddenly swerved, causing the wheels to touch the ground for a fraction of a second. Rising again immediately, the flight was finished in magnificent style, the machine being brought to earth within a few inches from the spot on which it had started. Farman declares that he has considerably improved his aeroplane by covering the front edge of the lower plane with canvas, rounding it off and reducing the air friction. When he has made the same change on the upper plane he believes that still better results will be possible.

Official notice has been given the Aero Club officials that Henry Farman will make an attempt to win the Deutsch-Archdeacon prize this week. To claim the \$10,000 prize the machine must cover a distance of one kilometer in the air, leaving the earth on a given line, turn around a post 500 meters ahead, return and cross the starting line again, descending at the point from which it took flight, or, if that is impossible, dropping in its flight some object within a circle of 25 yards from that point. The severity of the test lies in the turn around the outer post and the descent to earth at almost the exact starting point. Having on two separate occasions come within a few inches of meeting all conditions for the prize, when on practice spins, it is believed that Farman has every chance of winning the gold.

BERLIN TO SEE START OF THIRD AERO RACE.

Berlin will succeed St. Louis as the starting point of the third annual international race for the Gordon Bennett Aeronautical Cup, according to information received from Germany by the Aero Club of America. By reason of the victory of a German pilot in the last contest the next race must be held in Germany at any suitable point selected by the national club. After a thorough search and a consideration of the claim of a number of cities, the capital has been decided to be the most convenient spot from which to start the aeronautical competitors, the date of the 1908 race to be about October 1. Assurance is given that the Kaiser, who has always taken a keen interest in aeronautics, will be present at the start of the race. Owing to the large number of German aeronauts desiring to participate in the race for the cup, it is probable that elimination races will be held to select a team. France and America have already sent official challenges for the 1908 race.

Lieutenant Frank P. Lahm, winner of the first international balloon race, started from Paris in 1906, returned to America last Sunday on board the St. Louis. After undergoing a special course of training at the French military cavalry school at Saumur, Lieutenant Lahm was commissioned by the United States Government to make a thorough investigation into aeronautical matters throughout Europe. For this purpose he has visited France, England and Germany, examined the military airships of these countries, and had an opportunity of witnessing all recent aeroplane experiments in France. Lieutenant Lahm will proceed at once to Washington to present his report.

AERO CLUB MEMBERS AROUND FESTIVE BOARD.

Members of the Aero Club of America will unite in the second monthly club dinner at 6:30 P.M. on Tuesday, January 7, in the dining room of the Automobile Club of America, on Fifty-fourth street, west of Broadway. Dinner will be followed by an interesting lecture by Courtland Field Bishop and later by a smoker.

THE FUEL SYSTEM OF AUTOMOBILES*

By THOS. J. FAY, E.E.

IN the case of a new motor it is not so easy, for then it may be a question of adjustment, or perchance the carbureter is not of the right type at all. True, it would be strange for anyone to employ a carbureter of a character unsuited to the motor, in any given case, but such things are done, and it is necessary to take this phase of the situation into account. On one occasion the author essayed to deliver a new car to a friend, a car, in fact, of which the author had but slight personal knowledge. A brave start was made, but it ended in a long struggle, because one of the valves of the carbureter was not present, having been overlooked in the assembling process, and no notice was taken of the fact because the author did not know how the thing was constructed. It was necessary to call upon the maker to send a man to try to make the motor work properly, when, lo and behold, the expert fell into the same trap. In the end a little waste pressed into the passageways produced the same result as a valve and it was easy to discover that a part was missing.

The great question is to think, and to systematically try the various schemes likely to solve the problem, when the carbureter fails to do its work. Some of the ills are due to one cause and more to another. If the motor will not crank to a start, the mixture may be impoverished; if so, it is necessary to proceed to render the mixture rich by throttling the cold air and by reducing the area of the hot air passageway until the amount of fuel is sufficient to render the mixture efficient.

At such a time it is a good idea to make sure that the gasoline is present in adequate volume, and that water is not in the way. The pressure should be looked after, and it is well to make sure the spark is satisfactory. But a few days ago a friend called the author on the 'phone, late at night, and stated that he was down on Long Island with a car and could not make it "budge." He had tried every device known to the experienced motorist, but to no avail, so he said. The car was a "one-lunger," and it occurred to the author that the spark plug (porcelain) was split. Mr. Motorist said no, but after some talk he was induced to try a new plug, only to find that the motor cranked readily and gave no further trouble at all. Later the author learned that the autoist had previously tried the plug (in the air) and since it gave a good spark he assumed it was not defective. He did not take into account the fact that the resistance in the air is far lower than when in the cylinder under compression. The split in the porcelain was so slight as not to be seen at night, but it was enough to defeat the spark.

Think First and Look for Trouble After.

If the spark is good and the timing is right, it is then possible to proceed to locate carbureter trouble with a good measure of confidence. The more easy, to be sure, if the car may have previously performed in a satisfactory manner with the same carbureter; but it is always a good idea to think first and look for the trouble afterwards. On one car the gasoline pipe was led to the carbureter in a very roundabout manner and the author, en route from Rockaway Beach at night, miles from a habitation, found himself with a dead car, and after some time discovered that a "cock" in the gasoline pipe, well concealed under the car, with the handle so set as to jar the cock in the closed position, had succeeded in doing so. The cock leaked slightly and every time the carbureter was examined it showed gasoline. Upon starting the motor it would run for a moment and then die; there was no way to tell just what was the trouble, and it looked like a case of camping out all night. Upon entirely removing the pipe the trouble was found.

The relation of the hot to the cold air is a matter to adjust with some care. The hot air, as a rule, enters by a passageway

in juxtaposition to the nozzle, or the nozzle is in the hot air passageway. At all events the hot air is necessary in the process of vaporizing the gasoline and must be in quantity sufficient to do the work. Gasoline is a refrigerant, that is on changing from its liquid to its gaseous state the temperature is lowered, but in view of its low efficiency in this respect the amount of hot air needed is not great. In cranking a motor the cold air port is closed completely and the hot air port is so closed as to assure a rich mixture, so rich, in fact, as to supply an adequate fuel value, barely to keep the motor in motion at lowest speed.

That the flywheel has much to do with the matter may be proven by the simple expedient of trying to do without a flywheel, whilst on the other hand the heavier the flywheel the slower will the motor run if the mixture is rich and homogeneous. Just what should be the richness of the initial mixture is a matter to be settled in time, if in time knowledge of the fact will be afforded. As it is, one may be sure the mixture may be more rich if the compression is high than if the reverse is true, and it may be the richness, if the mixture is not far from five volumes of atmospheric air to one volume of vapor of gas-

FIG. 1.—Details of copper fuel tank and supporting bracket.

oline. Such a mixture would be very slow-burning and would be favorable to the starting project. It is necessary to have a slow-burning mixture, starting or running slow, else the piston would not get out of the way of the wave and the energy would be spent in heat to the water jacket, since a high increase in pressure would mean a high rate of transfer to the jacket.

There is always a certain relation of the rate of inflammation of the mixture to that of the velocity of the piston that evolves the maximum of useful work. This view of the matter seldom if ever receives a measure of attention, and it must be taken into account. Carbureters, as they are sometimes built, allow for a constant richness of the mixture, and a variable supply; the variable supply affects the rate of inflammation and in a way acts the same as if the richness were altered to bring about the same end. If, however, the throttle is used, the number of heat units change, whereas, if the fuel valve is held constant per cubic inch of mixture the fuel will do more work. Torque (pull in pounds at unit radius) is what is wanted, either in

* Continued from page 945 of THE AUTOMOBILE, issue of December 26, 1907.

starting or in running a motor at a slow rate of speed. Plainly, then, the change in quantity of the mixture is not so likely to produce the best results as if the thermal value be changed to produce a slower rate of inflammation with decreasing speed, or an increasing rate of inflammation with increasing speed, the

FIG. 2.—"Skimmer" or sump to collect liquid gasoline from manifold.

product of decreasing thermal value being brought about by the simple expedient of diluting the mixture with cold air.

Relation of Torque to Different Mixtures.

With changing thermal value on increasing speed comes decreasing torque, just as one would suppose. This same phenomenon would follow any similar scheme of procedure, while changing the volume would introduce other complications.

Motors deliver power on a basis as follows:

$$H. P. = S \times T,$$

in which:

The maximum *H. P.* (horsepower) follows; *S* (speed) maximum, and; *T* (torque) maximum.

The torque falls off with increasing speed for reasons as follows:

(a) The richness (thermal value) of the mixture decreases with increasing speed.

(b) The scavenging of the motor is less perfect as the speed increases.

(c) The friction component increases with the speed.

(d) The timing of the spark is more difficult and the ills due to this matter are emphasized.

(e) The torque falls fast if the compression is low, and *vice versa*.

Unfortunately the torque does not hold maximum for maximum speed, and the formula takes this into account, since the maximum power follows, if the greatest sum of speed and torque is taken. Some motors deliver this maximum summation at one speed and many at another. In the author's experience the highest attainable value was found in a racing motor at a speed of 1,800 revolutions per minute, whilst, as a rule, the maximum is realized at about 900 revolutions per minute.

These are matters of deliberate design rather than a chance, since if the valves are of liberal area and the compression is high the greatest power will be realized at high speed, whereas if the valves are small and the compression is low the maximum will be realized at a lower speed. The torque at a low speed will be the most favorable in a motor designed to deliver its maximum power at a comparatively low speed, and the lower speed motor is the most satisfactory for general service.

Broadly speaking, these are not carbureter matters, whilst in detail they surely are, for if a motor is of the high-speed type the carbureter must be designed to do the work on a high-speed basis. The common practice of using a common type of carbureter for all designs of motors in common leads to common results. The gasoline economy is a matter of growing importance, because the price of the commodity is slowly but

surely inflating, and the quality is slowly but surely falling off. Furthermore, motors are increasing in size, and as a sequence economy must follow. Economy demands the use of a carbureter exactly in accord with the motor's characteristics in each individual case, and to know what to do with the carbureter it is necessary to know about the motor. Some carbureters are not provided with hot air passages at all, and such adaptations are not only uneconomical but troublesome.

Motors will deliver more power, start easier and do with considerably less gasoline if the hot air connection is afforded, particularly if the relation of the hot to the cold air is nicely maintained. The mixture will be homogeneous and condensation will be done away with to a large extent. This condensation is most uneconomical and the presence of liquid in the passageways destroys the evenness of the mixture to such an extent as to defeat good running conditions. The depression chamber in a carbureter is a most important part of the device, since upon the depression depends the amount of fuel that can be lifted from the nozzle; moreover, the extent of the spraying will be in a measure dependent upon the same performance.

The depression comes from merely contracting the area of the passageway at the junction of the nozzle, and this area should be in some relation to the area of the cylinder of the motor. The most suitable area is not a matter that has been nicely fixed, nor is it an easy thing to do, since much depends upon the shape of the passageway and the position of the nozzle, if, indeed, the area of the nozzle may not have to be taken into account in this connection. Broadly, the area of the cylinder of the motor may be forty times the area of the hot air passageway at the junction of the nozzle forming the depression chamber. Whilst there is no great proof to bring to bear on the point, the cold air should not be allowed to mix with the rich mixture too quickly, thus giving the rich mixture full scope to become a gas, rather than an aggregation of liquid fuel, in spray form, inmeshed in a current of hot air.

If the cold air too quickly strikes the forming mixture the condensation phenomenon will be in evidence, and this will be fatal to the results. Some claim this is a matter of no moment, if only the manifold connecting the motor with the carbureter is long. More claim that liquid, even in the cylinder, does no great harm, since it will flash into gas in the heated atmosphere. Any such argument is surely resting upon a quagmire, because the liquid in the cylinder will be either extra to the amount required to saturate the air or stratification will be the main phenomenon and to no good purpose.

Dead points in the performance of carbureters must be due to the inability to deliver firing mixtures at all speeds, and the result is, at some speeds, the mixtures are not sufficiently inflammable. This non-inflammability can

follow condensation, or it may be due to over-much gasoline forming a slow-burning mixture as well as a flash charge, out of the way of which the piston cannot travel in a space of time so short as to render the energy efficient. In such cases popping in the carbureter will be noticeable, and it is a simple sign of impoverished mixture, due to excess cold air, at the point at which it transpires. If the motor performs well at a higher speed, the

FIG. 3.—Sample of high-pressure gasoline tubing showing its extreme flexibility.

FIG. 4.—Manner of locating filter in gasoline filler vent on the fuel tank.

defect is not serious, but if not, the gasoline supply is inadequate and the area of the nozzle should be increased.

In such a case the mixture will be found inferior for starting and by the introduction of more gasoline the motor will crank better and the speed may be reduced to a lower level, which, in itself, is a good characteristic. If a motor will work well at a very low speed, and at its maximum speed, the carbureter is quite at fault for missing at intermediate speeds. Sometimes the trouble is due to lubricating oil, too much of which reaches the cylinders at certain speeds.

Black smoke (without a gasoline odor) will be the evidence of this; if, however, the odor is of gasoline, excess gasoline is a further complication to be coped with. At all events, the gasoline vapor in a more or less combusted state is not so black and it is always well to eliminate the lubricating oil complication before fighting the fuel trouble.

Some Modern Tendencies Considered.

As gasoline becomes heavier, due to the scarcity of the supply of the lighter distillates, the difficulty in rendering the heavier products quick-combusting must be taken into account. One way to accomplish this feat is to employ a detonator, such as acetylene. A very small trace of this gas serves to render slow-burning mixtures, quick-burning instead. This is a good thing to know from another point of view, for if a motor refuses to crank a little of the acetylene gas from the generator used for lighting, led to the air intake of the carbureter, will do remarkable work and do no harm. The idea of adding detonating compounds to the fuel is gaining ground, and this is the most important detail of what are termed synthetic fuel products at the present time. Later on, perhaps, this genera of fuel will assume a greater importance, only if the cost can be reduced or if the cost of gasoline increases considerably over the present cost, not value, as but little consideration is required to show that this is a distinction with not a little difference, although the majority of autoists seldom look at the matter in this light, regarding these terms as practically synonymous.

Besides acetylene there are other detonators, as ammonia nitrate, picric acid, etc. Some of the detonators serve as etching compounds and as a consequence are not desirable, since the cylinder walls would be destroyed as a consequence of their use. Picric acid, for illustration, is used as an etching compound in metallurgy to prepare specimens to be micro-photographed, and the acid in question does not lose its ability to etch the surfaces of iron or steel merely because the shape of the metal is different or because the geographical position is different.

These detonators were used to some extent in racing work and in all probability some races were won on this account. In racing, if it is not foul to "dope" the fuel, it does not matter if the cylinders are destroyed if only they will hang out the race. What transpires in racing does not, of necessity, have anything to do with general practice, although it is a fact that racing has, on the whole, helped to develop the carbureter, if not the rest of the automobile. The fuel problem was undoubtedly advanced under racing conditions, and picric acid certainly did

play a part of some moment. The hydrocarbon products, as benzene, gasoline, etc., must, in the long run, go the way of all temporary expedients; the supply will be totally inadequate.

Some of the Hydro-carbon Products.

The products of crude oil vary considerably, even out of the same well, but they change very much for the several localities. The following will give a good idea of the composition of a sample of crude oil.

Above 76° Baumé, gasoline	3 per cent.
Between 63 and 76° Baumé, benzine	4 per cent.
Between 45 and 63° Baumé, kerosene	15 per cent.
Between 38 and 45° Baumé, heavy kerosene.....	8 per cent.
Between 28 and 38° Baumé, gas distillate.....	21 per cent.
Between 26 and 28° Baumé, light lubricating oil....	10 per cent.
Between 23 and 26° Baumé, neutral oil	12 per cent.
Between 21 and 23° Baumé, heavy neutral oil.....	6 per cent.
Between 14 and 21° Baumé, reduced stock.....	5 per cent.
Below 14° solid, asphalt	11 per cent.
Loss	5 per cent.

Total100 per cent.

It is a matter of no moment if this particular analysis is high or low in some of the distillates, since, in any event, the amount of usable liquid fuel is but a small percentage of the total under the most favorable conditions. To realize the liquid fuel the whole must be distilled, and the cost of handling the whole product is but one of the factors. Even if it was decided to abandon all but the part available for liquid fuel, the project would come to naught, because all the residue would have to be stored, since no sane community would allow the balance of the product to be dumped into a river or permit it to lay stagnant in a pool near any habitations.

To a large extent the law of compensation takes care of the inequalities, since the crude oil is now used to allay the dust of our roads, hence it may be observed that the automobile increased the demand for liquid fuel and at the same time created a demand for the by-product of the process. Automobiles create road dust and the by-product cements that dust, thus balancing the evils. At all events, it is as plain as can be that gasoline will ultimately have to be superseded by alcohol or a combination of alcohol and gasoline. The combination liquid fuel will, of course, hold some other compounds as detonators, like ammonia nitrate, etc., and acetone, or, what will serve the same purpose, render the synthetic fuel stable.

It would be very hazardous to attempt to use a synthetic fuel if there be any chance of the several products separating, since an increase in the percentage of ammonia nitrate by segregation, for instance, would result in an intense explosive. The author's firm have in hand experiments on this subject, but they are very slow and tiresome, since a full year is allowed ere a mixture is put into service, to make sure it will not decompose, and, in the process, form high explosives. True, it is possible to mix these fuels with some certainty, and it is hoped avoid all high

FIG. 5.—Details of fuel tank outlet and manner of application to the tank.

explosive formations, but this has never been the history of investigations into the performance of compounds that hold in their make-up earthquake propensities.

Alcohol alone is not, as yet, all sunshine, nor can it be said the alcoholic fuel will not attack the walls of cylinders, and it may not be out of place to observe the law of probabilities seems to hold in this as in other walks, since alcohol was ever wont to burn the coppers out of all who would insist upon its use. It was supposed motors were imbued with a sufficiently strong constitution to be immune, but there are grave fears on the subject. In the destructive process that obtains in a motor cylinder, especially if pyroligneous acid is present, and it is likely to be in the wood alcohol, at any rate, the cylinders are likely to be etched by the residue after the motor is shut down unless the last few minutes of the run are made with gasoline as the fuel. To what extent this will be a source of trouble remains to be seen; in time and as the product of experience. True, wood alcohol seems to be the great offender, and to avoid this it may be necessary to avoid its use.

The same carbureter cannot be used for all the fuels as carbureters are at present constructed, because the fuels are not all of the same density nor are all of them of the same thermal value. The floats would have to be adjusted to suit the gravity on each occasion and the nozzles would have to receive attention as well. The motors would not be economical for alcohol

FIG. 6.—Plan and sectional views of tank filler cap, illustrating special nut.

with a compression arranged for gasoline, and, on the whole, it seems the specific fuel will have to be taken into account in designing both the motor and the carbureter. This is not to say a motor designed to use gasoline will not run on alcohol, for it will. The economy will not be good, however, and it would be better to pay far more for gasoline than to use alcohol under such conditions.

It would be feasible to use two carbureters and two tanks for the respective combustibles, if time should prove that necessity will demand the use of a fuel besides gasoline, but it is not now easy to see how the compression can be changed at will (upon changing the fuel) and not introduce much of complication. It is barely possible that the whole matter will take on a favorable turn in the course of time, since there are unbounded possibilities in the field of mixtures of alcohol, gasoline, acetone, nitrates, etc., from which to evolve a satisfactory fuel may only be a matter of time and application.

There is one other point, not yet raised by anyone thus far, that may be of the greatest importance, i. e., air-cooled motors, whilst they serve very well indeed, are nevertheless not yet constructed in the larger sizes, because it is not so easy to keep the temperature within bounds. Alcoholic fuel has a strong bearing upon this phase of the subject, and it is believed the motors will be considerably less difficult to keep cool. One of the reasons for this lies in the fact that this fuel holds upwards of 15 per cent. water, and as water, instead of being a source of heat, absorbs heat, and lowers the temperature of the whole. And again, since alcohol has a lower thermal value per volume at a given pressure, it is plain that the heat at that pressure will be less, and the one deduction is that the cooling requirement will be lower.

With the alcoholic fuel, as before stated, a higher compression is desirable. This is due to the fact that pre-ignition does not take place as it does with gasoline, at an earlier pressure, and the best compression in any internal combustion motor is the highest obtainable compression inside of the point at which pre-ignition and knocking become a troublesome matter. With the higher compression alcohol should do quite as well as gasoline, gallon for gallon of fuel, whilst the higher inflammability and the more complete combustion should end in nearly equal power for equal area of the piston in any given case.

The details in general of the fuel system will not have to be discussed here at any length, because they are fairly understood, but there are points of some moment that will stand more light. Fig. 2 shows a "skimmer," the function of which is to trap off the liquid that may condense in the manifold. The figure is plain enough as to require no length of description. The device is of almost no cost, it takes but little room, and there are no loose parts to become deranged. When the manifold is undergoing design it is perfectly simple to introduce this feature, and it may be a baffle plate in the passageway, between the motor and the skimmer, at a point near the skimmer, would be a good thing to include. The author has not tried this additional feature. Fig. 3 shows a flexible copper pipe for the fuel system that has merit in several ways, amongst which may be cited the ease of installing and the entire absence of any tendency to split. This piping is tight against a pressure of about 1,500 pounds per square inch, and will take bends to about 3 inches radius.

Fig. 4 shows a filter in the gasoline filler pipe that is well worth taking into account, as by its use it becomes unnecessary to bother about the methods used in putting gasoline in the tank. There is no good reason for depending upon the public at large for clean gasoline when a filter can just as well be a fixture in the system. The filter, as illustrated, allows for cleaning at will and when the filter fails to pass gasoline it is time to do something about it; moreover, one can then reflect on what would be the consequences of no filter.

Fig. 1 shows a means of fastening the gasoline tank to the chassis frame, and it may be well here to state that the fastening is an important matter not always given good attention. This fastening shows for itself and has the advantage of a big surface in contact with the copper tank, thus eliminating the chance of having the hangers tear out of their fastenings. The hangers are of 1-8-inch boiler plate and are both light and strong; moreover, they are both easy and inexpensive to make.

Fig. 6 shows a filler cap devised to take a leather packing ring, thus making the joint tight, whilst the leather lasts for a very long time. The most important feature of this cap is that of the hexagon wrench extension (or head). This hexagon extension is slotted in such a way as to allow of the use of a screwdriver or other tool in backing the cap off. It is not always possible to put one's hands on a wrench of the right size for the purpose, and in such cases the slot is a handy facility. Fig. 5 represents a pipe connection to the gasoline tank that is simple, tight and strong. Connections have long been a source of annoyance in gasoline work and it is well worth while to devote not a little extra attention to the installation of this part of the fuel system of any car, as a permanent and well-installed connection between the gasoline tank and the carbureter is one of the first requisites of satisfactory service from this essential of the car. A little neglect here invariably makes its presence felt sooner or later, though the trouble is often most difficult to locate.

In conclusion, it may not be out of place to point out that it is desirable to provide a means for draining the tank at frequent intervals, but it should not be possible for the gasoline to escape through the drain as the result of vibration. A cock is a little inclined to be troublesome in this way, and a plug is, on the whole, the safest thing to depend upon. But it is one thing to have a plug and quite another to use it, and the plug is of small benefit unless used.

THE INDICATOR DIAGRAM AND WHAT IT MEANS

BY VICTOR LOUGHEED.

IN the periodical and advertising literature of the automobile industry, reference to "indicators," "cards," "diagrams," and "manographs" are becoming increasingly frequent, and though the terms are quite commonplace to the most indifferent engineer, they nevertheless must convey more of confusion than of information to the greater number of automobile owners, whose

technical training hardly averages deeper than the mere ability to pilot a car with a reasonable degree of success.

But the indicator, its relative the manograph, and its

FIG. 1.—Illustrating the theory of the indicator as applied to the gas engine.

product the indicator diagrams, all relate as much to the fundamentals as to the abstrusities of automobile engineering, and there is little reason why a simplified exposition of its construction and purposes should pass any one's understanding. Beginning with elementary automobile engine principles, it is, of course, understood that the piston is impelled from one end to the other of its working stroke by the pressure of a mixture of air and fuel vapor highly heated by the reaction from a chemical combination (combustion) of its elements. This pressure is highest at about the commencement of the stroke, before the heat of combustion is partially lost into its surroundings, and before the pressure is reduced by the heat loss and the expansion permitted by the moving piston. The pressure is lowest at the termination of the stroke, by which time the available energy of the charge is utilized and it is ready to be exhausted, that its place may be taken by a fresh, unconsumed charge. At intermediate points in the stroke the pressures are of intermediate values, the drop occurring at a rate variously determined in different engines by the quality of the fuel, the timing of the ignition, the piston speed, etc.

Taking another leaf from elementary principles, it is pretty generally known—from the very definition of the term—that the horsepower of any given engine is the product of its piston area multiplied by the pressure in pounds upon it, multiplied by the working travel in feet per minute, and divided by 33,000. However, as has been pointed out, no internal-combustion engine operates with a uniform pressure throughout the stroke; it becomes necessary for purposes of calculation to take into account the number of working strokes in a given time, and to ascertain the "mean effective pressure" that substantially represents the total of the work done in each stroke.

To illustrate, consider the case sketched in Fig. 1. In this A represents the cylinder and B the piston of a horizontal automobile engine, the working stroke being accomplished to the right—from the dotted line C to the dotted line D—the piston head as shown being aligned with the line C, ready to commence a power stroke. The pressure at different points in the stroke, as it would be shown by a plurality of small maximum-pressure gauges e f g h i j, screwed into holes in the cylinder wall and uncov-

ered one after another as the piston progresses to the end of its stroke, would be about in accordance with the figures printed above each gauge, in an average engine. If the gauges could be infinite in number, this would give a curve for the pressure rise and fall closely approximating the dotted curve r l.

A little further reasoning quickly discloses the fact that a plurality of gauges is not necessary if with one gauge it is made practical to record accurately and positively all of the fluctuations in pressure from the beginning to the end of the stroke—so that it could be known, for example, that at the beginning of the stroke the gauge had registered zero, one-half inch further on had registered 350 pounds, by another half inch 300 pounds, and so on to the end of the stroke. Obviously, too, to use a single gauge it must be attached to the head of the cylinder, that it may be at all times in communication with its interior, instead of having to be uncovered by the movement of the piston. In this connection it is well to note that the arrangement of gauges shown in Fig. 1 would be necessary only to insure their proper successive action, and not because of any variation in pressure in different portions of the chamber M, which becomes larger as the piston recedes, while the pressure drops throughout it.

The conditions to be fulfilled by an indicating device being defined, its mechanical construction might reasonably appear to take the form sketched in Fig. 2, in which A is the cylinder, B the piston, C-D the stroke length, and E a pressure gauge permanently in communication with the combustion chamber M. Forming a part of the gauge, the plunger N is adapted to rise and fall in proportion with the pressure, from zero to the maximum that is likely to be encountered—a range that will be from the dotted line O to the dotted line P. In the T-shaped top of N the rod Q, carrying a pencil point at R, is arranged to slide horizontally from C to D, the stroke length of the engine, it being pulled through this distance by the string S, affixed to the light standard T, bolted to the piston. Behind the pencil there is firmly mounted the card U, wide enough and long enough to accommodate the full possible travel of the pencil, both vertically and horizontally. Everything being arranged as shown, it can be easily perceived that the dotted curve R E, similar to that indicated by the same letters in Fig. 1, must be generated by the compound movement imparted to the pencil by the pressure gauge and the spring.

The whole principle of the indicator having been explained, its practical application and the utility of the

FIG. 2.—Crude form of gas-engine indicator, showing its component parts.

diagrams from it call for further comment. First, it must be understood that it is scarcely practicable to use on most engines so crude a contrivance as is employed to illustrate the principle in Fig. 2. In most indicators the dial portion of the gauge (E, Fig. 2) is omitted and all possible care in the design and construction of the device is de-

FIG. 3.—Specimen of typical gas-engine indicator card showing exhaust and compression.

engine. This is conveniently effected in most good indicators by wrapping the card about a cylinder, which is revolved to secure the horizontal traverse, while the vertical movement is by means of a multiplying action magnified into a more readable exaggeration of the plunger movement. Still another element involved by considerations of practical utility is some provision for automatically throwing the whole service in and out of action for one or some other predetermined number of strokes, while the engine is kept running at a uniform speed.

Several typical automobile-engine indicator diagrams are shown here. In each case these are made to occupy at least the full number of strokes required to complete the engine cycle. Fig. 3 is from a four-cycle engine, the top line showing the explosion, the next to the bottom line the exhaust, the bottom line the suction, and the next to the top line the compression stroke. This card is from an engine of the common type, working efficiently at its best speed, and its explosion line shows very clearly the enormously rapid rise of pressure after ignition, up to the peak *A*, from which maximum there is a gradual fall to *C*, where the exhaust valve opens, causing the abrupt drop to *D*. In the compression stroke the pressure is seen to rise at an increasing rate to *E*, where ignition occurs, and whence the rapid rise to *A* commences. It will be observed that most of the suction stroke and a portion of the compression stroke fall below atmospheric pressure, which corresponds to the line *F G*.

FIG. 4.—Illustrating the effect of late ignition on the power produced.

The mean height of the explosion line of a diagram gives the mean pressure. From this is to be subtracted the negative work imposed during suction, compression and exhaust. For practical purposes, with a correctly adjusted engine, the power consumed in the suction and exhaust strokes is too small to be considered, leaving only the compression to be subtracted. The simplest way to realize this subtraction is to disregard the space below the compression line, leaving that between the compression line and the explosion line to be regarded as the "work area" of the diagram. This area, redistributed into a rectangle corresponding in length to the stroke, will have a height commensurate with the mean effective pressure, from which the power output of the engine can be readily calculated. In specifying a basis for horsepower ratings, the German Government

FIG. 5.—Several superimposed diagrams, showing effect of throttling.

decrees that 55 pounds to the square inch shall be taken as the mean effective pressure in automobile engines. Few, if any, internal combustion engines of any type whatsoever have realized mean effective pressures as high as 90 pounds to the square inch. The diagram Fig. 4 is from the same engine as is the preceding case, and is of interest chiefly because it shows how ignition delayed to *H* causes a lowering of the peak *A* and a loss of work area throughout the entire diagram. The failure of the explosion line to run directly back upon the compression line to *H* is explained by the absorption of heat from the cylinder walls. It is further to be noted in Fig. 4 that the scale of pressure at the left of the card and the scale of stroke positions across the bottom of it are not present as in Fig. 3. This is because the usual requirement is for data comparative only with respect to the different portions of the diagram itself, and not with regard to arbitrary scales of pressure and of stroke dimensions. The card shown at Fig. 5 shows how by a maintained application of an indicator a number of superimposed diagrams may be secured, showing most graphically just what occurs when an engine is throttled down.

At Fig. 6 the card shown is from a two-cycle engine, so there are only the compression and the explosion lines to be seen. A typical card from a steam engine is shown at Fig. 7. This card presents marked contrasts to the gas-engine diagrams. All strokes in both directions being power strokes, one complete revolution of the crankshaft produces the two reversed diagrams given. Moreover, the pressure is maintained at its maximum for nearly half the stroke, to a point at which cutoff of the motive fluid occurs and is further accompanied by expansion of the motive fluid down to atmosphere.

Internal combustion engines of all classes have been for years regarded as most difficult subjects for indicator research, and until within recent years the application of the device has been all but confined to steam engineering. This has been because the pressure fluctuations within gas-engine cylinders are of such great amplitude, and occur with such suddenness and violence, as to make it almost impossible to devise mechanism with parts light enough to act as quickly as is required, and at the same time strong enough to withstand the shocks imposed.

As a matter of fact, practically all successful results in indicating gas engines have been obtained through the use of the strictly modern manograph—a modified type of indicator in which there is substituted for the pressure gauge a spring controlled circular diaphragm, which in conjunction with the piston movement exercises a compound control, in the form of vertical and horizontal oscillations, over a small circular mirror.

FIG. 6.—Indicator card from a two-cycle motor, omitting exhaust and compression lines

A NEW STEP IN MAGNETO DEVELOPMENT

By ERNEST COLER.

THE observation that the average chauffeur seldom likes to "dope out" magneto ignition systems applies with even greater force to the owner, whose principal objects in making use of the motor car are the saving of time, the attainment of comfort and the pursuit of pleasure.

All repairmen will agree that even the well-paid and presumably more than ordinarily intelligent chauffeur, after a general overhauling job, experiences considerable difficulty in getting the magneto to function as well as it did before he laid his dissecting finger upon this part of the mechanism. Many chauffeurs who are able to solve the mysteries of the four-unit coil circuit are completely at sea with the average magneto. The new magneto systems to be described in this article are the invention of Robert Miller, M.E., of New York, another of whose inventions—the gearless friction transmission—was described in the issue of November 14; they are of the pure high-tension type and differ from other magnetos principally in that they are in frictional contact with and driven by the flywheel or by belt, and revolve, in one system, at a rate approximately six times faster than the engine. The number of sparks produced is six per magneto revolution, so that the total spark production is 36 sparks during each revolution of the engine. In this respect the arrangement corresponds somewhat to the action of a single coil, vibrating all the time and distributing the secondary circuit to the various cylinders.

If this sparking cycle be divided into the degrees of the crank cycle it will be found that they are spaced about ten degrees apart. Objection might be made that the ignition in a multi-cylinder gasoline engine thus operated would not be synchronous; that is, the moment at which sparking begins might be later than indicated by the distributor. Ten degrees, the maximum possible variation, is a very short distance measured in the length of the stroke, especially around the dead center. However, in comparing the Miller system with the four-unit coil system it will be seen that the action of the four coils is anything but synchronous; in other words, the four vibrators cannot be tuned alike, and there are inevitable variations, even greater than ten degrees, in the timing of the spark. Likewise in using the four-unit system with the modern addition of the master vibrator, it is easy to demonstrate that although the vibrator action is the same for all four coils, this arrangement lacks every guarantee that the four coils will be in equal electrical balance or continue so for any definite length of time.

With the use of the Miller magneto the engine is started in the usual manner by cranking, or the magneto may be rendered self-starting, as will be explained later. With the new magneto it is unnecessary to "spin" the engine in order to turn the magneto sufficiently rapid for effective sparking, because of the fact that even with a slow turning of the cranking handle the magneto will revolve much faster and will produce the desired ignition.

The magneto has a vibrator, condenser and low-tension coil for starting at slow speed only, and as the engine attains a certain predetermined speed these are cut out automatically and eliminate in this manner the necessity for continued use of the attachments. Simultaneously with the cutting out of the vibrator

the high-tension coil alone is used and acts as the simplest kind of high-potential alternating current generator, in which neither moving wires nor contacts are employed.

It can readily be seen that the operation of this magneto offers no problems whatever to the inexperienced driver, because the need for his attention is limited to seeing that the friction wheel of the magneto is in contact with the flywheel, and that the sparks occur under the glass cover of the distributor, which is made in the most approved style, non-wearing, with the contact points separated by a small gap. In fact, should sparks not appear at a distributor point it is evidence that either the corresponding plug or its connections are at fault.

The current is generated by means of inductor pieces fastened to a shaft running on Hess-Bright ball bearings, which require very little attention, being packed in grease. The magnetic core of the coil is bent around so as to come within the field of the inductor pieces. These inductor pieces, in revolving, change the magnetic flux through the coil, the magnetism leaving the magnet at the north end, going through one inductor piece, up and over through the iron core of the coil, down on the other side through the corresponding inductor piece, which leads it to the south pole, the flux varying at different positions. This is more clearly shown in the accompanying drawings.

With 36 sparks produced every revolution of a four-cylinder engine, the sparks are distributed so that one-half of them enter each cylinder during each explosion stroke, with the result that in the four-cycle type, even should the first spark fail to ignite the mixture on account of imperfect carburetion, etc., the next spark, coming only ten degrees later, is certain to fire the charge, because the charge itself has become hotter and more readily ignitable through longer contact with the hot cylinder walls. In this manner it will be impossible for the engine to pass unignited charges into the muffler, there to explode. The plurality of sparks also exercises a cleaning effect on the spark plug terminals.

The distributor is, in this case, made to time the 18 successive sparks for each cylinder of the four-cylinder four-cycle engine, or 12 sparks for the six-cylinder engine. Of course, it is possible with this magneto to use the ordinary type of distributor, in which a timer in the primary circuit controls the action of the secondary circuit, but the type illustrated herewith is simpler and less apt to get out of order. In experimenting with the new magneto Mr. Miller has made a series of trials and pro-

FIG. 1.—End and side elevations of the new Miller magneto, showing disposition of the windings.

duced many forms of inductor pieces and cores for the coils, in some cases going so far as to make the cores of a non-magnetic shell filled with finely divided or chemically reduced iron with which a quick magnetizing and demagnetizing action may be obtained.

The illustration shows that the coil is the same as used with battery circuits, having vibrator, condenser, etc. Although a safety spark gap is provided, in case of damage a new coil can be inserted quickly and at very low cost, doing away with the expensive pulling down of the entire magneto and rewinding of the armature. In Fig. 2 the magneto is shown altered, so that each limb carries a smaller induction coil, connected in series. The cost of the Miller magneto can be made alluringly low, and it may be placed even in the low-priced runabouts, a selling price of from \$30 to \$35 being probable.

The self-starting arrangement is as follows: The distributor, which, of course, is controlled by the hand lever on the steering post, is brought to the proper position, as is now done with the four-unit coil systems, and the magneto shaft is given several quick turns by means of a small spring motor incorporated in

sign somewhat, with results even more interesting than those already enumerated. The same general scheme of stationary wires, with revolving inductor pieces, is used, but the rate of speed is confined to a maximum of 2,000 to 2,500 revolutions a minute; the friction wheel in this case is smaller and controlled by a governor such as is much employed on small dynamo sparkers. The result is that only a few sparks per engine revolution are produced, of a correspondingly greater angular variation.

To insure proper timing of this system, the high-tension wires feed into a Leyden jar set in the magnet arch above the coil, and are there held until this jar is discharged by the distributor. In order to make it possible for the Leyden jar, which is a modified condenser, to be charged and yet not discharged as the current potential falls away, what is essentially an *electrical check valve* is interposed in the circuit.

The coil generates current up to about its maximum pressure; connection is made with the Leyden jar, which becomes charged; the connection is then broken, and as both coil and jar are of the same potential no current passes from the jar. At the proper moment the distributor rotor on the engine gets in position and makes a path through which the jar can discharge.

Those familiar with the rapidity of the discharge oscillations of the ordinary condenser, as used with the primary windings in induction coils, will appreciate the impulsive force with which the Leyden jar discharges itself. Such impediments as soot, oil, water, etc., on the spark plug points have no influence whatever on the action of this spark; even external short circuits of a moderate extent are powerless to divert it from its proper path. This is due to the enormous difference in the discharge rate of the high-tension coil and of the condenser; it has been estimated that the latter discharges at a rate of from 1,000 to 4,000 as great as the former. We have here, in fact, the action of the lightning stroke on a small scale. The entire coil, with connections and Leyden jar, can be sealed up in paraffine or pitch, so that only the weather-proof spark is exposed. Instead of glass, other insulators, not liable to breakage, can be used.

Of course, the first system is simple and perhaps more adapted to be used by the unskilled driver; yet it is clear that the latter system possesses a number of distinct and noteworthy advantages.

TO THE MAKING OF THE MOTOR MECHANIC.

Austrian automobilists are watching with much interest a project which promises to provide efficient repair shops and skilled workmen for making automobile repairs throughout the country districts, facilities which have hitherto been sadly lacking outside of the cities and towns. The Auto Technical Association is organizing a training school for automobile repair work in the rooms of the Handicrafts Exhibition. It is especially intended for country blacksmiths, locksmiths and other mechanics with a knowledge of machinery, and, besides helping to provide automobile repair shops in country places, the school will open up a new means of livelihood to these workmen, many of whom have lost a good deal of their original business through the introduction of the automobile. The school will be completely equipped with tools and all requisites for the work of repairing cars. The course of instruction will last four weeks. Special provision will be made for the admission of workmen in poor circumstances by the grant of a small pecuniary compensation for the time spent in the school.

Widespread use of the automobile in cities has been accountable for a change in the habits of more than one city dweller, but neither the inherent keenness of vision nor the great agility of its feathered denizens who find their living in the streets is quite able to cope with the car's silent and rapid approach, and the result is more than one dead pigeon that could easily have escaped the swiftest horse.

FIG. 2.—Illustrating arrangement of windings in proposed modification of generator, each pole carrying a separate coil.

the hub of the friction wheel. The spring motor is wound by the action of the engine; to self-start, it is released, to be re-wound as the engine takes up its motion. Another alternative is to give the magneto shaft a couple of quick turns by means of a multiplying device placed on the dash. Spark advance and retardation is taken care of by altering the position of the distributor, as is now done with the low-tension timers used in the multiple-unit systems. Of course, where occasion demands, the placing of the coil in relation to the magneto or to the inductor pieces could be changed; it is believed, however, that the arrangement shown offers many advantages over the usual placings.

A Highly Interesting Modification.

The objection might be made that for small cars of low power the device described in the foregoing would consume a measurable proportion of the power output; although the sparks are more numerous than in the ordinary magneto, yet the magnets are so proportioned as to give only about the equivalent magnetic saturation to the core that is given in the usual battery systems. The electrical pressure in this system is the result of the rate of line-cutting rather than of the intensity of the magnets themselves.

To overcome this objection, Mr. Miller has modified his de-

LETTERS INTERESTING AND INSTRUCTIVE

IS THIS FAULTY CARBURETER ADJUSTMENT?

Editor THE AUTOMOBILE:

[1,057.]—In your issue of December 12, I notice letter No. 1,012, which case I believe applies somewhat to my car, which is a two-cylinder (Buick), which I have great trouble in starting, despite the fact that after it is in operation, it runs very smoothly and has very high power. The carbureter is a Schebler, which is at the end of a piece of brass tubing, close to the end of the engine. This tubing has a drop of 6 inches in a 2-foot length, terminating in a "Y," which branches off to two tubes, one running to each cylinder. There is a drip hole at the bottom of this "Y," and oftentimes, no matter how carefully I set the carbureter, clean gasoline will drip out of there. I have been bothered with it more or less for some time, as it seems impossible to get it accurately set so that it will give satisfaction at all speeds, so that I am compelled to throw the gasoline off at the bottom of the tank every time it is used, to prevent it running down the pipe and leaking out of the drip hole. This is despite the fact that I have adjusted the carbureter very carefully and it does not begin to leak for some time after the engine has stopped. As the "Y" is directly under the flywheel, it would be a very bad place to locate the carbureter. In fact, there is hardly any place in which the carbureter could be located where it could come lower than the "Y" and be accessible. If you can advise me of a new way to pipe up the intake so as to do away with this, I shall appreciate it. The machine is a Model F Buick, of 1906 make, and has given absolute satisfaction in every way but this, often showing more power than larger four-cylinder cars with much more powerful engines.

Louisville, Ky.

R. S. HILL.

In view of the fact that large numbers of the type of car you mention are in daily use, it would seem quite probable that if the trouble you complain of were due to an inherent defect in the design, such as would require the replacement of the intake manifold, complaints on this score would be more common. On this account it seems more than probable to us that you will find the fault in the adjustment of the carbureter. If gasoline begins to drip out, even though only after the engine has been stopped for some time, this would indicate that the float level is too high, thus permitting the gasoline to overflow the moment the fuel reached it. The constant demand upon it by the engine while running prevents it overflowing at other times. The fault may not lie so much in the adjustment as in the fact that the float may have become loggy, if cork, thus sinking somewhat and raising the gasoline level to a corresponding extent. As you are located in a large city, you should be in a position to get in touch with other owners of the same make of car and ascertain if they have the same difficulty. Also consult the agent of the car and look at later models of the same car, to see if the manifold arrangement has been altered in any way. Even the designer only learns by experience where many of these details are concerned and if the trouble has been due to faulty design you will doubtless find that it has been modified to suit the requirements. The maker will also doubtless be glad to be of assistance, if you write the factory stating the nature of your trouble. The same effect is frequently due to totally different causes, so that it is not always safe to jump to the conclusion that the same remedies will be equally effective.

The difficulty in starting may be due to any one of a number of different causes, but judging from the outline you give an overrich mixture would appear to be responsible. The liquid gasoline collecting in the drop of the manifold fills the latter with practically pure gasoline vapor, which will not ignite even under the most favorable circumstances. There is so much of this vapor present that cranking several times does not suffice to clear the passage and introduce enough air to form a mixture. As soon as the cranking ceases for a few moments the manifold refills, thus maintaining practically the same condition. There should be a stop cock placed in the gasoline line from the tank to the carbureter so that the supply could be shut off at any time. This would avoid the necessity of emptying the tank.

LAYING UP STORAGE BATTERIES IN WINTER.

Editor THE AUTOMOBILE:

[1,058.]—Will you kindly tell me in your next issue which is considered the cheapest and best way of taking care of Vesta storage battery for the winter? The garage in this city tells me to saw the plates apart. It is all Greek to me, but I understand it is practically tearing the battery to pieces and soldering it together again in the spring. On the other hand, they want to charge a dollar a month to store it and run it down. I don't find the battery advertised in your journal and do not know where their factory is, so therefore write you for suggestion.

Duluth, Minn.

DR. F. C. LEE.

It is evidently worse than Greek to the garage keeper who advises you to saw the elements to pieces. This would practically mean ruining the battery, as it would have to be returned to the makers to have the connections burned together again. They are joined by lead burning, not by soldering, and we cannot conceive where the garage keeper got his idea that it was necessary to disconnect the plates. The charge for storage is likewise excessive, unless it be intended to recharge it every fortnight, which is one method of keeping a battery. Where this is not convenient it is not a difficult matter to take it out of commission so that it may again be used in the following spring with little or no trouble in reassembling. First, have it fully charged and then remove the elements from the jar and separate them. That is, lift the positive group of plates away from the negative. There is always one more plate in the negative than in the positive group, though they may be readily distinguished otherwise by the marking of the elements with minus and plus signs, respectively. After charging and removing from the jar, wash the positive thoroughly in clean, soft water and allow it to stand immersed for an hour or so in order to be certain of removing all the electrolyte. Do the same with negative, and when dry the positive element may be stored in any convenient place where it will not come to harm—preferably in a cool and dry situation. Should the negative become warm and steam while drying, rinse in water again. When thoroughly dry, the negative should again be immersed in the electrolyte of the proper specific gravity, *i. e.*, 1.275 to 1.3, and allowed to remain for several hours, care being taken to see that the plates are entirely covered. It should then be lightly rinsed in water, dried and stored, the same as the positive. The separators and other small parts of the cells should also be thoroughly cleaned in soft water and put away after drying. Where worn or cracked, as in the case of wood separators after long service, it is advisable to replace them.

CONCERNING A NEW DRAGON ROADSTER.

Editor THE AUTOMOBILE:

[1,059.]—I inclose herewith small drawings of a Dragon Roadster, which I recently purchased at the Chicago show. I am particularly anxious to find out what the horsepower rating under the A. L. A. M. would be. At the given weight of this car, will you kindly advise whether or not you should have this car geared 2-1-2 to 1, or 3 to 1, in view of the fact of its having but two speeds and would be used here in St. Paul where we have a number of grades for daily use of from 9 to 12 per cent.?

St. Paul, Minn.

DRAGON.

The indicated horsepower of the engine of the car you mention, as calculated under the A. L. A. M. formula, is 36.4 horsepower. We should recommend the 3 to 1 gear ratio as being better suited for all-around work, particularly in a hilly district, and more especially in view of the fact that there are but two forward speeds. The power of the car is high for its weight and should enable it to mount pretty stiff grades on the direct drive and at quite a speed. As a 32-inch wheel covers approximately 8.3 feet per revolution, it would give the car a speed of about 31 miles an hour at 1,000 r.p.m. of the motor, or 46 to 47 miles an hour at 1,500 r.p.m., with a 3 to 1 gear ratio.

Raising the latter to 2.5 to 1 means that the road wheels would make a complete revolution, omitting all considerations of lost power or road slip, for every 2 1-2 turns of the crank-shaft, which would give the car speeds of 38 and 57 miles an hour, respectively, at the different motor speeds mentioned. It will be evident that these speeds are excessive for any ordinary requirements and there would be few opportunities to use them with safety, while they would, moreover, make the car too speedy for city work, which would mean that the motor would have to be run throttled down continually or the clutch slipped. In other words, it would require more manipulation to handle the car in traffic. The lower gear ratio, i. e., 3 to 1, would permit the motor to be run at a better speed and would not impose as severe service on it in the long run.

AN EXPENSIVE REMEDY FOR CLUTCH TROUBLE.

Editor THE AUTOMOBILE:

[1,060.]—I have been having considerable trouble with a slipping clutch, which is leather to metal. I am informed by my machinist that this has two causes.

In the first place, that there is not thick enough leather on the clutch, and, therefore, it gets very hard, and, secondly, that the clutch is too much cone-shaped, and that if I lessen the cone it will grip better. He explains that this can be done by turning 1-8 of an inch off the smallest diameter of the flywheel, and building up the leather on the clutch. The clutch now has a 4-inch bearing surface, and in that 4 inches there is a cone of 1-2 inch. He suggests lessening this to 3-8 inch. Is he right in what he says?

On the cardan shaft of my car, between the clutch and the gear box, there are two movable joints, which, if they were placed at right angles to one another, would make a universal joint, but I note that both joints move in the same direction, that is, the axles in both joints are either pointed to the right and left, or up and down, both being in the same position at the same time. Surely there has been a mistake on the part of the man who assembled it, and these two joints should be at right angles, so that when one is moving from right to left, the other could move up and down.

The two joints I alluded to are (as I said) between the clutch and the gear box, and about one foot apart. There are two similar joints behind the gear box, between it and the differential, and they are exactly in the same relative positions, that is, the axles of both joints are always pointed in the same direction. I conclude that those are also wrongly assembled.

I will be very much obliged for your opinion on this matter, as I think there has been a mistake made in the assembling of the shaft, for they have no resemblance to a universal joint in the position they are now in.

I am advised by a French driver that neatsfoot oil is better for use on leather than castor oil, that is, that it softens the leather better, and is less of a lubricant. Is he correct?

Toronto, Canada.

CHAUFFEUR.

Before adopting the advice of the chauffeur it would be advisable to consider the matter from every point of view. If his suggestion be correct, then it must be inferred that the clutch was poorly designed from the outset and never was right. Your experience with the car should enable you to answer this one way or the other. If you have had trouble of similar nature ever since you have had the car, then it would appear that probably the design was at fault. But if the car performed satisfactorily for a considerable period of time and has only been giving this trouble more recently, would it not seem to be jumping at an unwarranted conclusion to decide offhand that the design was wrong? We see nothing radically wrong in the figures you mention and while turning the conical face of the female member of the clutch down to an easier angle might effect a more gradual engagement it will not prevent slipping, other things remaining the same. Hence we do not agree with your driver. Building up the leather is only a makeshift and will not prove satisfactory. In fact, it is much more apt to prove otherwise, for reasons that will be obvious.

That the leather gets very hard does not necessarily prove that there is insufficient of it on the clutch to do the work. It merely goes to show that the clutch is frequently slipped, as it is the friction created that hardens and polishes the leather. How about the adjustment of the clutch itself and its seating spring?

If the leather facing appears to be too thin, moving the clutch slightly further into engagement and strengthening the compression of the spring should afford a remedy. If this trouble with the clutch be chronic, and not due to poor adjustment or poor driving, we should advise doing away with the leather facing entirely and substituting cork inserts, thus making it a metal to metal clutch. This would be far more satisfactory and doubtless far less expensive than the remedy your driver suggests. Regarding the question of oils, we have had no experience with neatsfoot in this connection and cannot advise; castor oil is very largely employed for making leather belts adhere to metal pulleys in factories and shops.

We find it impossible to recognize the particular type of universal that you refer to from your description, nor do you state whether the car has just been reassembled after dismantling or whether it has been run with the joints in this condition. Can neither your driver nor the garage attendants tell you whether the joints have been wrongly assembled or not? Reference to the maker's instruction book should shed some light on the matter.

THAT HARDY PERENNIAL ONCE MORE ON DECK.

Editor THE AUTOMOBILE:

[1,061.]—Will you please let me know through your columns if the inside or outside wheels of an auto taking a curve at great speed leave the ground? Does the same apply to a locomotive?

New York City.

TIMOTHY P. GUINEE.

The inside wheels of any four-wheeled vehicle tend to leave the ground when rounding a curve at high speed for reasons that must be plain on a moment's consideration. It is on this account that the outer rails of a track are elevated. Assume a vehicle, such as an automobile, to be traveling at high speed in a straight line. The car, with its load, weighs 4,000 pounds, or two tons, and is traveling at the rate of fifty miles an hour. It will be evident, then, without going into the mathematics of the subject, that the force represented by this traveling body is little short of that of a huge projectile which has just left the gun; and it must be evident that this tremendous force, thus exerted in a straight line, cannot be turned from its path in violation of natural laws without serious consequences. In other words, the moving body has a very strong tendency, proportionate to its speed and weight, to continue traveling in a straight line, and in order to take a curve safely it must be counteracted to a point where there is no danger of the inside wheels of the vehicle leaving the ground to an extent that would make overturning imminent. Consequently, curves are banked and speed is reduced in rounding them. The effect of the former is to bring the center of gravity of the moving body on a line with the inside wheels, thus concentrating the entire weight on that side to prevent its being lifted by centrifugal force. The most common manifestation of the action of the latter is to be seen in the manner in which the passengers are moved bodily toward the outer side of the car in a train rounding a curve at high speed. There are some autoists who are quite certain that they have seen the outer wheels of an automobile leave the ground when it was rounding a curve, and who stick to their theory of the matter despite all explanations to the contrary, but they doubtless never paid any attention to this action while riding in a train or in the tonneau of an automobile, where it is very much more pronounced.

TROUBLE WITH A LEATHER-FACED CLUTCH.

Editor THE AUTOMOBILE:

[1,062.]—I have been a subscriber to your publication for several years and shall appreciate your advising me through your "Letters Interesting and Instructive" as to the following: In the timing of an engine, I thoroughly understand that if the two to one gear is slipped one cog either forward or backward, it will change the timing of the engine, either later or earlier. If this is done, can the correct timing be made again with the commutator, pushing it forward or backward? I am having some trouble with the cone leather-faced clutch, it engaging too much. It

has three spiral springs in the male part of the clutch, which press upon the leather when engaging in the flywheel. I put three thin pieces of brass under each spring, thinking to remedy the trouble, but it made them worse, so I took it out, but I still have the trouble with the clutch catching too quick. I have tried oiling the leather with ordinary lubricating oil, but it seems to have no effect. I, however, note in one place that the spring is worn through the leather. Would this cause the fault, or would you advise relining the clutch? How would three cork inserts do?

J. G. S.

Louisville, Ky.

Upon a little consideration of the matter, it will be apparent that the relative position of the contact in the timer, with reference to that of the piston of the cylinder to which it corresponds, is the essential aimed at in timing the ignition of a motor. Consequently, it is immaterial whether an alteration in the relative positions of these two parts be brought about by altering the relation of the driving gears, or the position of the timer itself on its shaft, so that moving the latter will naturally compensate for shifting the gears.

It seems evident that the fact of the springs having worn through the leather facing is responsible for the rapidity with which the clutch takes hold, as these points are naturally higher than the remainder of the male member of the clutch and consequently come in contact with its seating sooner than intended. Cork inserts would be far preferable to merely relining the clutch, as it was previously, and would improve the action and service of the clutch in every way. We should advise corresponding with maker of the car, or the manufacturers of the cork inserts before proceeding.

ENGINE WITH UNJACKETED HEADS RUNS HOT.

Editor THE AUTOMOBILE:

[1,063.]—I have a two-cylinder horizontal 5 by 6 engine in my automobile, which will fire three or four times after running awhile when the switch is cut out with the throttle partly open. These cylinders are water-jacketed on the sides only; the heads of the cylinders are not water-jacketed. Please answer in your columns whether or not it would remedy this trouble by putting on copper water-jackets on the heads of these cylinders. It is not on account of carbon in the cylinders that it fires without the spark, for it will do it after cleaning out the carbon.

New Castle, Pa.

FRANCES CORNETTE.

As many of the old-time motors with unjacketed cylinder heads have seen years of service, it appears to be jumping at conclusions to decide that the fact that this part of the motor is not water-cooled, is entirely responsible for the trouble. How about the performance of the motor when you first got it? Did it not run without overheating then? Naturally it is much more difficult to prevent a motor of this type from overheating, but if the engine has ever performed satisfactorily for any length of time it would seem that the latter, and not the design, was responsible. Placing copper water-jackets on the heads might prevent firing from pre-ignition through overheating, but it would not remedy the cause of the latter. See if some one or more of the numerous reasons that bring about this state, such as an overrich mixture, improper timing, poor cooling-water circulation, or the like, are not in evidence. Such a motor has to be kept in better condition to prevent overheating than one in which the efficiency of the cooling system is so high as to overcome these irregularities. It would be preferable to remedy the trouble first, even if the copper water-jackets were added.

THE FUNCTION OF THE TREMBLER.

Editor THE AUTOMOBILE:

[1,064.]—In various books and articles on the subject of automobiles, it is stated that the function of the trembler, or vibrator, commonly used in connection with the coil of a high tension ignition system, is that of producing a rapid succession of discharges of electricity across the terminals of the spark plug during the moment of contact. Now a fellow driver tells me that there is nothing to this but theory, and that the trembler makes only a single spark, he says, due to the rapid succession of power strokes within the cylinder. I contend that this is not the case, else why does the vibrator make the same buzz at all engine speeds, and I

am getting sure I am right, but for the sake of having some documentary evidence on the subject, I would appreciate seeing your opinion published in "Letters Interesting and Instructive."

Paducah, Ky.

CHRIS. OLDHAM.

Your friend is partly right and partly wrong. The function of the trembler is not to produce a rapid succession of sparks at the plug during the ignition contact for a single stroke, but it does, of course, make more than a single vibration during the moments of commutator contact. The fact that the vibrator will continue to act indefinitely when the circuit is closed and while the current lasts is proof enough of this. The "rapid succession of sparks" theory, however, is pretty generally conceded to reduce itself to this: No trembler blade, as ordinarily made, and under ordinary conditions, can be made to work much faster than 200 vibrations a second and 1/200 second is time enough for the piston to move so far—at all but the very lowest speeds—that the second spark cannot be of much use if the first fail to produce ignition. For instance, sparks occurring 1/200 second apart are 18° apart on the crank circle at 600 revolutions a minute, and proportionately farther on closer at higher or lower speeds. Moreover, the speed of vibration as realized in actual practice, especially with run-down batteries or poor adjustment, is apt to be very much slower than 200 a second.

ABOUT THE USE OF OXYGEN ON RACING CARS.

Editor THE AUTOMOBILE:

[1,065.]—In one of the late numbers of one of your contemporaries, I noticed an article on the use of oxygen for spurts in racing, in which they seemed to have no ill effect upon the motor; however, I have often heard that it quickly wears out the connecting rods and wrist pin, owing to the increased force of the explosion. Which of these is right?

Boston, Mass.

INTERESTED SUBSCRIBER.

It must be borne in mind that, in racing, the life of the car is a factor that is never taken into consideration. It is built to attain the greatest speed of which it is possibly capable and the fact that its life may be exceedingly short is never taken into consideration. Hence the ultimate effect of expedients which will aid it in fulfilling its mission do not enter into the question at all. They will make it run faster and that is all that is wanted. In skilled hands, oxygen can doubtless be employed to great advantage without seriously shortening the life of the motor, but that "it seemed to have no ill effect on the motor" is hardly conclusive. This simply means that it did not ruin the motor then and there, though this was one of the risks incurred by its employment. Increasing the force of the explosion considerably beyond that for which the motor was designed can only have one effect, and that is to wear it out sooner, if it does not end its career suddenly.

CONCERNING HORSEPOWER AND LUBRICATION.

Editor THE AUTOMOBILE:

[1,066.]—Give horsepower of my R. E. O. 1907 car double cylinder, 4 3-4 bore, 6-inch stroke. Also please tell me the best make of oil to use on same machine. Have been using Vacuum mobiloil, but if there is anything better, I want it. How about Havoline oil? Have a letter from that company giving it a very good recommendation.

Angola, Ind.

HARLEY H. WEBB.

The indicated horsepower of the two-cylinder horizontal opposed motor of the Reo car is 18, at a speed of 1,000 r.p.m. That is, this is its output based upon its dimensions. We have no doubt it does as well as this on a brake test, if not better. The oils you mention both have an excellent reputation in the market and are very largely employed. Write to the makers of the car and ascertain which particular brand they recommend, as manufacturers frequently specify certain oils which they know from experience will give good service in their engines.

SOME QUERIES ON VARIOUS TOPICS.

Editor THE AUTOMOBILE:

[1,067.]—Being a subscriber to your valuable paper, I desire to ask you some questions through your columns. Tire chains, I

believe, absorb more power than the leather type of studded anti-skids, but you can inform me if the Midgley tire treads would take as much power to operate as a regular rubber shoe which is smooth. Can you think of any engine with a two-cylinder vertical engine and sliding gear transmission with shaft drive? Either two- or four-cycle? What metal would you recommend for the engine bearings of a 1904 Franklin? Would babbitt answer?

New York City. FRANK ALDEN MILLER.

While we have no data at hand, nor are we certain that there is any extant, we should say that on a smooth road tires with Midgley treads would consume slightly more power than smooth treads owing to the coefficient of friction being higher. But for the same reason, under adverse conditions, the wired tread would probably waste less power through slipping than would a smooth tread, as on a greasy or slippery surface.

The Renault small cars answer this description, and there may be one or two others, though we do not recall them at the moment. This car is made in France, and the engine is of the four-cycle, water-cooled type using thermo-syphon circulation. Babbitt metal would doubtless answer for relining the bearings of the car you mention, though the makers may have some special alloy which is superior, and which they would be pleased to supply on request.

OIL FOR USE IN A COOLING SYSTEM.

Editor THE AUTOMOBILE:

[1,068.]—I would like to inquire whether or not the common kerosene or lamp oil can be safely used in the cooling system of a Reo two-cylinder car. I know of a number of parties who are using oil in the cooling system during the winter weather, and as it does not freeze, I would like to try it if practicable.

East Liverpool, O. WALTER B. HILL.

Common kerosene oil would be far from suitable to employ as a cooling agent in the radiator of a car, as a moment's reflection should show. Even the best grade of lamp oil only has a flash point of 150 degrees Fahrenheit, what is usually known as "150 test oil." As the temperature of the cooling water of a car is more frequently above this point than below, when it is in use, it must be evident that kerosene would be rather a dangerous thing to have around under such circumstances. Ordinarily, a lighted match dropped into kerosene would be extinguished, but at this temperature and above it the result would be a blaze, the seriousness of which would be aggravated by the vapor arising from the kerosene when thus heated. We do not know exactly the grade of oil employed by manufacturers of oil-cooled gasoline engines, but presume it is a good grade of machine oil, of light body and high flash point. Another disadvantage of kerosene is that of its low boiling point, which would cause it to boil away very rapidly, even though the motor ran without overheating.

WHAT IS WRONG WITH THE THREE-CYLINDER?

Editor THE AUTOMOBILE:

[1,069.]—Will you kindly advise as to whether, in your opinion, a three-cylinder, two-cycle engine is an undesirable proposition? A friend of mine tells me that three-cylinder engines have always proven failures. I would like to know the objections to such, if you would be kind enough to state them.

Will you also advise as to whether, in your opinion, it is detrimental to make a practice of running on the street car tracks on city pavements? C. C. BLANCHARD.

Providence, R. I.

As the two-cycle engine fires every cylinder on every downward stroke of the pistons, a three-cylinder, two-cycle engine with the crankpins set at 120 degrees, makes a well-balanced and very smooth-running engine. We have never heard of such engines being failures. Doubtless your friend refers to the four-cycle type, in which a better balance is obtained with four cylinders than with three. The practice of constantly running on street car tracks concentrates wear on the tires at their weakest point—the sides of the tread—and this naturally tends to shorten their period of service, as tire makers will testify.

WHAT FRICTION TRANSMISSION IS THIS?

Editor THE AUTOMOBILE:

[1,070.]—Some time ago I read an article in "The Automobile" descriptive of a new friction drive which has been put on one of the 1908 cars. I would like, if possible, to get a copy of this description and would be pleased if you would let me know how I can obtain the same.

CHARLES CHIPMAN.

Easton, Pa.

In the issue of THE AUTOMOBILE of May 9, 1907, there was published, on page 788, a description of the Gearless transmission, which is practically a planetary change-speed gear, utilizing friction members instead of the customary spur gears. This was the only special reference to a friction gear that represented any radical departure from standard practice in this respect.

SUPPLEMENTING MR. POWELL ON IGNITION.

Editor THE AUTOMOBILE:

[1,071.]—The letter of E. Leeds Powell, No. 1052, in your December 26 issue, raises the question whether it is in the end more expedient to meet the principal objection to the dry battery as a source of ignition current by providing a larger source of supply, or by using the current more economically. Mr. Powell says very correctly that to ignite the mixture requires a hardly measurable amount of energy, the obvious reason being that only one spark is required to do the work if the mixture is anywhere near correct. Consequently, if the demand on the battery were limited to furnishing this one spark for each ignition, the battery ought to last long enough to satisfy the most exacting. The only reason for using a storage battery is to furnish cheaply a large supply of current to be wasted in unnecessary sparks, and the storage battery performs this service fairly well when it is in order, the worst objection to it being that the average inexperienced owner never knows whether his storage battery is in order or not, until it is down and out. If there were no current wasted, there would be hardly any reason for using the storage battery.

The makers of magnetos are attacking the problem from the standpoint of furnishing more current than is necessary, in order to be sure to have enough, and most magnetos absorb far more mechanical energy than is converted into electricity, so that mechanical wear and tear is the natural result. If a magneto could be built to furnish just current enough, and furnish it efficiently, it would be ideal; but the current depends on the speed, and to be sure of having current enough at low speeds, the magneto must be large enough to furnish a great excess of current at ordinary to high speeds, and all this is wasted. There is certainly need somewhere of a better ignition system than those in common use.

New York City.

HERBERT L. TOWLE.

AN EXPLANATION OF DR. TUTTLE'S TROUBLE.

Editor THE AUTOMOBILE:

[1,072.]—While reading your valuable paper, "The Automobile," I noticed one of your reader's difficulties, that of Dr. Edward G. Tuttle, letter No. 1,028. I have had the same experience which he describes while repairing and putting into commission a motor boat this last June. The particles which he refers to are of shell-like substance and come, as he says, from the tank. This tank which I refer to was made of galvanized iron and is called charcoal iron, a good many tinsmiths making their tanks from this charcoal iron. This charcoal iron has a peculiar scale which gasoline in time will eat and it then floats around in the tank in small scale-like particles. I had this same experience happen on an automobile which I was repairing, these same particles clogging up the intake pipe and making the motor skip and miss as if there were short-circuited plugs on the engine. The remedy I used was to get a tinsmith to make heavy-gauge copper tanks for them. Of course, the cost of the copper tanks was about double the galvanized iron tanks, but the boat and the auto have been running since they were put in without any trouble to their owners.

Salem, Mass.

C. E. G.

WANTS GOOD TOURING MATERIAL PRINTED.

Editor THE AUTOMOBILE:

[1,073.]—I read with pleasure your "1,000 Miles in New England," and in a later publication of "The Automobile" I read George A. Fay's letter about it, which you headed: "What One Autolst Wants to Have Printed." I wish to say that as far as I can learn a great proportion of American autolsts are interested in articles like the above named, at least a great proportion of the autolsts in this locality are, as I have heard quite a number discuss it since the trip has been published.

GEORGE H. WALTERS.

East Orange, N. J.

COMBINED SPARK PLUG AND PETCOCK.*

"Still another spark plug, you say! When shall we see the end of the stream of accessories of that type that are always making their appearance; always the same, and which are presented to us in as many different forms as there are dress-makers in France?

"Quite so, yet another spark plug. But, then, what a spark plug! Its inventor, in creating it, certainly made no pretensions to bringing forth something superior, where the ignition itself is concerned, than that which already exists in the highest forms. If that had been his object he could not have produced anything better than the best plugs, and these are already legion.

"But in observing the new Eyquem plug you will note at a glance the incomparable advantages that it presents over others—advantages so striking that you will be unable to resist the desire to give it a trial, and we may note in passing (a fact that is of considerable bearing on the matter) that it is no more expensive than a good, self-respecting plug of any kind. Its

EYQUEM COMBINED PLUG AND PETCOCK SHOWING CONNECTION.

chief advantage is to be found in the fact that it may be cleaned automatically by the fresh gas in the cylinder. The button shown at the right in the illustration forms the handle of a petcock, and, the body of the plug being pierced from end to end, the gas can blow through it when the handle is turned to the position shown in the photograph, thus cleaning it out very effectively.

"But that idea is not novel and its introduction has not been attended with the great success which was confidently anticipated for it, as the burning gases in passing through the porcelain insulation always endangered the latter. Where, then, is the invention of M. Eyquem?

"It is to be found in the small piece of wire which will be noticed sticking down from the metal shank of the moving part of the petcock, and which, as shown in the illustration, comes in contact with the body of the plug when the petcock is open. In this manner the current is short-circuited at that plug the moment the petcock opens, so that the gas which is forced out of it is fresh and charged with gasoline. In consequence there is no danger of breaking the porcelain, for the reason that everything is cooled off and the cleaning is perfect. Here is an advantage of the new plug that will be appreciated by chauffeurs.

*Translation from *L'Automobile*, Paris, by Charles B. Hayward.

Instead of having to dismount the plug to ascertain its condition, it is only necessary to open the petcock to a point where the wire extension comes within about a millimeter of the body of the plug. If the spark jumps it shows that the plug is all right and that the trouble must be looked for elsewhere. If it fails to pass, there is something wrong with the plug and it should be changed. It also provides an easy manner of hunting for a troublesome miss, as the current may be short-circuited on the plugs successively and by opening all the motor may be left so that it cannot be started. It also serves as a priming cup.

ON BALL-BEARING GASOLINE MOTORS.

My objections are based on the terrible jobs that we have with ball bearings on nearly every make of car, says David J. Smith in the *English Mechanic*. Ball bearings should not be placed in positions where they are subjected to shock. As soon as a little wear has taken place (ball bearings do wear, in spite of statements to the contrary), a slight hammer action is set up. In time, this either chips the hardened faces of cup or balls, or produces a slight flat on the balls. As soon as this occurs, the end of that bearing is near, and in a short time those balls resemble pieces of lump sugar in shape. No makers in the first rank are, to my knowledge, using ball bearings in their engines. When the internal combustion engine can be got to run as smoothly (not by multiplying the cylinders) as a steam engine, then it might be possible to use ball bearings satisfactorily, but not while the impulse remains as a violent shock on piston, as all explosions must be. Ball bearings are being used too freely at present by men who do not understand their actions and limits of successful application. Ball bearings are decided upon in a certain vehicle. Good! The makers' list of ball bearings is taken, and a bearing or bearings to take the load chosen ordered and fitted. Then the trouble starts, and the poor repairer has to take the blame of an idiotic designer, who ought to be dosed with the balls for pills. One make of car that I get a good number of to repair has ball cups and races forced into aluminum castings. When these are worn, it is almost impossible to get them out, grinding through the race with a small high-speed emery wheel being about the only way. This means a new race, balls, a lot of work, and a big bill. In cars built a few years ago, the chassis hardly ever gave trouble. In modern cars of many makers, not only has the machinery to be looked to, but new balls, races and bearings have to be fitted to hubs of wheels, axle bearings, bevel pinion shaft, etc. A favorite type of bearing now is the cage type, containing a single row of balls. Go to Olympia show and I will wager that you will find a great number of cars there with these fitted to the front wheel spindles. There are generally two of these bearings in each hub. Now, the steering wheels are inclined outwards, as they should be, which means that a big thrust is thrown on the under side of these bearings continuously, and I believe that not in a *single* instance is a *thrust* bearing fitted. The race is cut away on under side, and steering quickly gets sloppy, and *no* adjustment is possible. I have many modern cars that in six months' running have more slop in front wheels than in many old Panhards, Daimlers, etc., that have been running six years, and the slop on these is adjustable even then. Ball bearings are capable of doing the work, and the fault does not lie with this type of bearing, but the way that they are used. Here, again, I take the opportunity of stating that no man should inflict the design of a car on the public until he has served a year or two in a repair shop where all makes of cars are repaired. Here is a last instance of how balls are used. Rear axle of "Ruinem" car, live; wheels running on tubes driven by dogs from shaft. Plain ball ring bearings, two in each hub. *No* thrust bearing. Near side rear wheel worked in until internal hand brake shoes cut through supporting flange of drum, when brakes were on descending steep hill. Car swerved into ditch, nearly killing occupants, and ruining car. Age of car, nine months.

HOW THE AUTOMOBILE IS WINNING THE BOUNDLESS WEST

A WAY out in the edge of Colorado is one real estate firm that uses six touring cars daily showing land to customers, and this has become a common thing for the real estate dealers of the West, so much more ground can they cover in this way, says the December *World To-day*. In the Panhandle of Texas, to which excursions are being run every month, every firm uses cars. In one place a firm has the sale of ranch lands twenty-two miles from the railway station. To get a good track it plowed a sixteen-inch furrow as straight as could be drawn, turning over the sod and leaving a smooth, hard surface. Then a car was run over this route, with one wheel in the furrow and the other whitened with flour, leaving a mark on the sod. Another furrow was turned, and now there is a straightaway course of twenty-two miles with two smooth, hard tracks, and the cars with seven passengers make the trip in forty-five minutes several times a day.

No one in the Western town gets so much practical good out of a car as the physicians. Distances are magnificent on the plains, and while settlement has advanced, the towns are far apart, compared with the East. The county-seat doctors have a clientage that reaches out twenty miles in every direction, and with teams and buggies they find it almost impossible to cover it. With a runabout they make their seventy-five to one hundred miles a day, and are satisfied. Those who do not own cars pay more than the cost of maintenance in hiring them from liverymen. The automobile has done more for the physician's practice than anything the West has ever discovered.

The editor of a country paper in the West wrote four columns describing "Our New Auto," after he had purchased a machine. It was not necessary. Out of his two thousand subscribers probably one-tenth knew more about motor cars than he did himself; one-twentieth owned cars, and as many more will by next spring. Twenty-two cars were photographed on the streets of a prairie town one day last summer, and ten more owned in town were absent. Trips to the mill with a few odd sacks of wheat, or to market with the fresh vegetables are ways in which the Western farmers are utilizing their cars. It is becoming a possession as common in the Western country town as it is in the Eastern city.

The problem of the car in the country town is entirely different from that of the city owner. Wages are not so high and the conditions inspire a greater self-reliance on the part of autoists. Take a specific instance of a town two hundred miles west of the Missouri river in central Kansas. It is a typical prairie city of less than five thousand persons. The automobile was intro-

duced at first by several poor second-hand machines, and only two years ago did the first standard machine make its appearance. Now there are twenty cars, one-fourth of them touring cars, the remainder runabouts. Others are being added every month. Many farmers are buying, several mail carriers have runabouts with which to cover their rural routes, and a livery with automobiles for hire does a good business.

Western roads, in the prairie States especially, are very fine eight months of the year. They are free from stones generally, and hills are moderate, all tending to encourage the motorist. It is because of these conditions that it is becoming possible for the man with moderate means to own a car. There is so little amusement in the plains region—the mountains and the lakes are nearly a thousand miles away—and motoring opens up a wide new field for pleasure. When one may drive thirty to fifty miles in an evening over dirt roads that are as smooth as asphalt, with prairie breezes blowing health and rest into one's cheeks, it is worth while. On such roads tire troubles are reduced to a minimum. My first two thousand miles with a four-cylinder car were without a puncture, and with no injury except a sand blister on one tire. Tire records of four thousand to six thousand miles are common, and there is much satisfaction in the promise of long life for the most sensitive portions of the equipment.

AN IMPROVED COLLAPSIBLE AUTO PAIL.

Automobilists having traveled any distance with a leaky radiator which had to be filled with the ordinary type of collapsible canvas pail have generally arrived home with stronger feeling against the latter article than against their cooling apparatus. Though it is easy to bring the water to the radiator it is not such an easy matter to put the liquid where it is wanted. An improved type which has recently been put on the market overcomes these difficulties by making the pail funnel shaped and fitting the base of it with a metal tube ordinarily closed by a simple valve. The pail, the simplicity of which is apparent by the illustration, is made of rubber cloth, bound by a circle at the top, to which is attached a handle, the valve being operated by means of a chain fastened to the handle.

Cheap taxicab service was established in London on New Year's Day. Twelve cents a mile, or 12 minutes, and 6 cents the half-mile, or 6 minutes, is the new rate.

HOW TWO REO CARS WERE UTILIZED BY E. C. SPERRY AND PARTY FOR A DAY'S DUCK HUNTING AT RATON, NEW MEXICO.

ONE OF THE STRAIGHT, BROAD HIGHWAYS THAT MAKE FRANCE ENVIED AMONG NATIONS.

THE present road system of France was started by the first Napoleon. No new roads of importance have been opened in some years, but the work of the engineers in the Department of Public Works of France is confined to keeping the roads in a state of high efficiency. France, to its remote and inaccessible sections, is so traversed with excellent roadways that there is now no necessity of adding many more lines of communication. The highways are the chief competitors of the railroads. The far reaching and splendidly maintained road system has distinctly favored the small landed proprietors and in their prosperity and their ensuing distribution of wealth lies the key to the secret of the wonderful financial vitality and solid prosperity

highways, their national system consists of 23,656 miles of national routes, which cost the nation \$303,975,000 to build. The national routes traverse the entire nation and connect the important centers, and are now paralleled by railroads. They have also department routes connecting the important centers of a single department, also their more local roads. The national roads, 23,656 miles, are in charge of a single-headed department, with one man responsible for their maintenance and good condition.

Public opinion requires that the local highways be kept in a sufficiently good condition to permit of a good draft horse hauling a load of 3,306 pounds eighteen and a half miles per day.

PRIZE GIVING FOR ROADS MAINTENANCE.

OCONOMOWOC, Wis., Dec. 30.—There is now a plan on foot to offer a number of handsome prizes for good roads building, commencing early next year, the object being to greatly improve and to maintain one of the most important runs in the State. Back of the movement is the Milwaukee Automobile Club. The project is to divide the highway into several districts and to offer cash prizes for the best kept sections. The prizes will be offered to the several property owners or farmers through whose premises the highway runs. The highest prize will be \$250, and they will run down to a sum that will be large enough to stir up interest alone.

This section of the State is the most famous in all Badgerdom in the matter of unique schemes to improve and keep up the roads. At one time the wealthy summer home owners offered school children cash prizes for throwing stones off the road while they were trudging back and forth in attending schools in country districts. Pathmasters were appointed, they watched the work, and on their reports the prizes were awarded.

It might be mentioned in this connection that not long since the women's clubs of Kane county, Ill., raised over \$1,000 to improve and beautify a road along the Fox river. The money was raised by selling a silver spoon, engraved in the bowl of which was the head of a famous Indian chief who used to trail over the road in pioneer times and always was noted for his kindly treatment of the palefaces. The spoons have been sold to people living in half the States of the Union

INDIANA SPENT \$7,000,000 FOR ROADS IN 1907.

INDIANAPOLIS, IND., Dec. 30.—Indiana has spent almost \$7,000,000 for new roads during 1907, and the most of this amount since April. This is greatly in excess of the amount spent for similar purposes in any previous year and is due largely to the law passed by the Indiana Legislature last spring authorizing roads not more than three miles long, when petitioned for by fifty taxpayers of a county, providing it connected two roads traveled by rural mail carriers.

The resources for road making consisting of rich gravel and limestone deposits in almost all parts of the State, together with the coming of the bicycle, the automobile and the rural route carrier, has done more than anything else for roadmaking. Some counties have built from sixty to one hundred miles of new gravel or stone roads during the present year and figures will soon be issued by the State on the subject.

It is estimated that more than 35 per cent. of Indiana roads are now improved, probably a greater average than any other Western or Middle West State can boast. Although the new road law has not been greatly in favor with public officials, there has been no determined effort so far to test it. In Madison county, where the greatest objection is raised to it, a number of new contracts have recently been let.

Indiana possesses some of the best established automobile manufacturing concerns in the entire country, and the increasing number of autos undoubtedly has had a vast influence upon the great progress in roads building in the year just closing.

Importers Make Bold and Most Artistic Front.

Even those who are surcharged with American automobile patriotism must admit that the Importers have made a brave attempt this week in Madison Square Garden to challenge the general belief that the day of the European car in this country is waning and approaching the last quarter of the moon.

This situation was inevitable from the beginning, but the reaching of it may have come much sooner than was anticipated by those dealing in foreign cars. Of these concerns the most discerning have grabbed time by the forelock and secured an additional agency for a home product.

What Has Been Attained with Free Alcohol.

Much surprise seems to have come to certain observers of the fuel situation that immediately upon the passage of free alcohol legislation in this country a tremendous industry did not spring up and the price of the commodity fall to a purely nominal figure.

So much for what has been accomplished in the space of a single twelve-month toward lowering the price within approach of an attainable minimum. Where its use as a fuel is concerned, it was no more to be expected that this would meet with any immediate widespread adoption than that millions of capital would at once be invested in its manufacture.

The Great Value of Uniform Auto Legislation.

At a time when the legislative mills are about to take up the task of grinding out a new crop of automobile legislation, it is opportune to call attention to one or two salient points in the legal situation, which every autoist who has his own interests and that of his confrères at heart should bear in mind.

The most immediate remedy is that of uniform State laws, and every autoist in the country should do his best to second the able efforts of the American Automobile Association in this direction.

Of course, the Federal registration bill of the A. A. A. introduced at Washington refers solely to registration, and when passed will establish a plan whereby home registrations will permit an autoist to go anywhere in the country.

OVER FIFTY STARTERS EXPECTED FOR THE GRAND PRIX

PARIS, Dec. 23.—Fifty-five to sixty is estimated to be the number of cars which will line up for the start in the French Grand Prix, to be held under international rules, during the first fortnight of July. Entries only opened a few days ago, and will not close until 6 p.m. on February 15, but sufficient is known of the intentions of all the important constructors of automobiles to prophesy with certainty a larger entry than for any event in France since Paris-Madrid.

Excluding America, whose participation is very doubtful, five nations will take part in the great speed test. France will supply full teams from Renault, with Szisz, Caillois and Dimitri as drivers; Panhard, to be handled by Heath, probably Teste, and a third not yet chosen; Brasier has definitely made up his team with Théry, Baras, and Bablot; Bayard-Clément, though not having signed any contracts, will certainly have Garcet as leader, and probably Rigal and Leblon; Dietrich, as in previous years, will have the same trio, Duray, Rougier, and Gabriel; Motobloc has only chosen two drivers, Pierron and Courtade, the third to be appointed in January; C. G. V. will have either one or two cars at the starting line, but nothing is known as to their drivers; Breguet has promised two six-cylinders, but as the exact regulation for this type of engine has not yet been made known, no steps have been taken; Mors is not absolutely certain to start, though should they do so, Gasté and Landon will be two of the drivers. Hotchkiss will not race; Gobron and Porthos are doubtful. If rumor can be relied upon, Westinghouse will participate in a race for the first time. For France, this would give 22 certain starters and 9 doubtful.

Italy will have four full teams. Fiat drivers will be Nazarro, Lancia, and Wagner. Itala will be handled by Cagno, Fabry, and probably Henry Fournier. Isotta-Fraschini is expected

to have as drivers Minoia, Trucco, and Tamagni. S. P. A. is said to be busy on three cars, but has not chosen drivers.

Belgium has already entered three Germain cars, to be driven by Degrais, Roch-Brault, and Perpère. Pipe has at present only selected Hautvast, but two other drivers are being looked for. Minerva refuses to make an official announcement, but probabilities are that three cars will be entered.

From Germany, Mercedes, Benz, and Opel are certain starters, Mercedes to have as drivers Willy Poegge, Salzer, and Baron de Caters, or Burton. Hemery, Hanriot, and Erle will handle the Benz cars. Fritz Opel and Jaerens will drive for Opel.

From England Ariel is the only certain starter, one car from this factory being finished, and will probably be joined by a second. Crossly and Simplex are spoken of as intending to race, and the same is said of Napier, but this latter firm may be set aside as a non-starter.

On a moderate estimate this would give 53 starters, made up of 22 French, 12 Italian, 9 Belgian, 8 German, 2 English.

According to the information to be picked up around the factories, it would appear that all the contestants in the 1908 Grand Prix will have the maximum bore of 155 millimeters and stroke from 170 to 175 millimeters. At the Panhard factory three engines have been built and tested out on the bench, the cylinder dimensions of each being 155 by 175 bore and stroke. Before going on the cars they will be put into motor boats and tested at Monaco. Shaft drive will be adopted on this year's Panhard racers, and there will be four speeds and reverse, with ignition by high-tension magneto.

Bayard-Clément has built three distinct models with cylinder dimensions respectively of 155 by 160, 155 by 175, and 155 by 185 bore and stroke, all being well advanced except the last. The probability is that the 155 by 175 engine will be adopted.

A. A. A. RACING BOARD ISSUES SANCTIONS AND ADOPTS RULES

SANCTIONS for three important contests were decided upon by the executive committee of the A. A. A. Racing Board, at a session held at 437 Fifth Avenue, New York City, Saturday morning, December 28. At the session were Vice-chairman Frank G. Webb, who presided in the absence of Chairman Thompson; Dave H. Morris, A. R. Pardington, E. Lincoln Lippitt, A. G. Batchelder, A. L. Riker, and Secretary F. H. Elliott. President William H. Hotchkiss was also present.

The sanctions granted were as follows:

Automobile Club of America, Ormond-Daytona, Fla., March 2-7.
Savannah Automobile Club, Savannah, Ga., week beginning March 15.

Robert L. Morrell, Chairman, Briarcliff Trophy Race, Westchester County, N. Y., April 24.

It being the sense of the meeting that in future sanctions the use of international and national should be granted only with the consent of the Board, on motion of Mr. Morris, seconded by Mr. Lippitt, the following was adopted to be incorporated in the racing rules:

An international race is a race where the entrants are respectively named by and represented by two or more of the recognized national affiliated automobile clubs of the world.

A national race is a race where the entrants are respectively named by and represent any two or more of the automobile clubs affiliated with the American Automobile Association.

It was stated that the compilation of the 1908 racing rules was practically completed and same will be announced in printed form early in the new year.

CHAIRMAN OF CUP COMMISSION MARRIES.

Jefferson deMont Thompson, chairman of the A. A. A. Racing Board and of the Vanderbilt Cup Commission, and Mrs. John E. Dunlap-Bradshaw, daughter of the late Robert Dunlap, were married Saturday noon, December 28, at the home of the bride's mother, Mrs. Robert Dunlap, 111 West Seventy-second street, New York City. The Rev. Dr. Allen McCreedy, of the Rutgers Presbyterian Church, performed the ceremony. The bride's uncle, H. K. Burras, gave her away. Mrs. J. Lawson Johnson, of London, the bride's sister, was matron of honor. The maid of honor was Miss Marion Baker. P. S. Thompson was his brother's best man.

S. A. E. MEETING AT THE NEW GRAND.

Friday afternoon and evening, January 3, there will be held at the New Grand Hotel, Broadway and Thirty-first street, New York, the third annual meeting of the Society of Automobile Engineers. The afternoon session will be devoted to the election of officers and the reading of papers on various subjects of interest. This will be followed by a dinner in the evening and the reading of the remaining papers prepared for the occasion. Among the subjects to be discussed are the following: Automobile Hub Ball Bearings, by Henry Hess; Nature Hard Gears, by Thomas J. Fay, and Some Notes on Self-aligning Taper Roller Bearings, by H. W. Alden.

JERSEYMAN'S ECONOMICAL FIGURES FOR 6,000 MILES

Editor THE AUTOMOBILE:

A few days ago I read in THE AUTOMOBILE of a detailed statement of the items of the cost of upkeep of a 20 horsepower car. I send the following account of my expenses:

My car is a 24-horsepower, four-cylinder, four-cycle, air-cooled car, with the cylinders in a "V." It weighs, without the top, empty, over 2,200 pounds. It has storage battery and dry cells in reserve. It cost, without top, \$2,500 f. o. b. factory.

This car, between May 28, 1907 (date of purchase) and the end of November, 1907, was driven 6,006 miles by me. Of this mileage about 1,000 miles was on a trip through New England and the rest was made in New York and New Jersey and vicinity. While a large part of this was on macadam, much driving was done in out-of-the-way country districts on dirt roads.

I have kept two separate books for this car. In one book I enter each day (that I drive) the odometer reading on starting and on my return, and the amount of gasoline put into the tank. I also enter therein the amount of oil, grease, etc., put in and date of same, also the date when anything is done, such as taking off and greasing wheels, putting on or taking off tires, charging battery, etc. In the other book I enter every item and its cost, and the date when the amount was paid. In that way many of the items in the first book appear also in the second book, which, of course, contains all items of whatsoever nature they may be.

	Cost in cents, per car mile.	
Tires: Casings.....	\$101.05	1.682
Inner tube.....	9.40	0.156
Repairs to casings and tubes.....	18.55	0.308
Anti-skid devices.....
Power: Gasoline, 531 gals.....	94.45	1.572
Cyl. oil, 15 1-2 gals.....	11.90	0.198
Grease and gear case oil.....	3.30	0.054
Ignition: Charging storage battery.....	3.95	0.065
Dry batteries.....	3.30	0.054
Spark plugs.....
Repairs: Miscellaneous.....
Ordinary.....
Due to accidents.....	3.90	0.064
Lights: Carbide and kerosene.....	2.12	0.035
Garage clothing.....	1.00	0.016
Labor.....	11.05	0.182
Making adjustments.....	4.90	0.081
Spare parts taken on trip but never used....	3.05	0.052
Sundries.....	20.16	0.335
Replacing lost and damaged tools.....
	\$292.08	
Storage and cleaning.....	51.25	0.856
	\$343.33	5.716

In order to have a clear understanding of the above it will be necessary for me to make the following statements: (1) Under the item "labor" is understood work such as the follow-

ing: Taking off wheels and greasing their bearings, taking off tires, sandpapering and shellacking rims, replacing tires, washing and cleaning outside of engine and sub-frame, etc.; but no repairs of any kind were charged up under this head. (2) Under "adjustments" were charged once taking up wear in connecting rods and adjustment of level of carbureter. (3) The repairs due to accidents were: Straightening steering rod on account of running into a dog, and repairing a lamp damaged by a carriage being backed into it.

To make a fair comparison between the cost of maintenance of my car and the one mentioned in the issue of December 12 I shall have to say: That I only had to pay for storage (which included washing and cleaning the car) during the months of June and July, and on the two weeks' New England trip; the rest of the time I was able to store my car rent free in the garage of a relation. In order, therefore, to make the comparison a fair one, I shall add to the item of \$51.25 for storage and cleaning the sum of \$120, or a total of \$171.25, although I actually paid only \$51.25. That is to say, I assume that this year I paid for nine months of live storage (including cleaning) at \$15 and three months of dead storage at \$5, because I have not the time to use my car during the winter and consequently lay it up during that season. On this basis my expenses would amount to \$463.33, or \$0.07714 per car mile, for a mileage of 6,006 miles.

Five hundred and thirty-one gallons of gasoline for 6,006 miles gives an average of 11.10 miles to the gallon; 15 1-2 gallons of cylinder oil gives an average of 387.09 miles to the gallon.

Of the four tires originally on my car, one went 4,940, one 5,072, one 5,200, and the fourth 5,800 miles.

My valves were not ground until after the car had gone over 5,000 miles, and then they were not at all in bad condition. My spark plugs did not have to be cleaned until after I had gone over 5,360 miles, and I have the same plugs in the engine today that came with the car when I bought it.

I seldom carried less than four in my car, and often carried five. It is safe, therefore, to place my average number of passengers at three; three and a half would be nearer. On the basis of what I actually paid, therefore, it cost me 1.905 cents per person per mile, leaving out of consideration the first cost of the car. In the second case, where I assume that I paid \$463.33, I should have paid 2.571 cents per person per mile.

My car is in excellent condition in every respect, and, so far as my knowledge extends, I do not know of any car of its weight and power which has been run so economically and with such remarkable freedom from trouble of any kind, except some of the same make in this vicinity with whose owners I am acquainted.

The top, speedometer, insurance, vulcanizer, registry of car, 1907 license, and car number cost \$247.10.

J. G. C.
EAST ORANGE, N. J.

WHERE THE AUTOMOBILE REPLACED THE RAILROAD

WESTBURY, Long Island, N. Y., Dec. 30.—According to the New York Times correspondent more than two hundred large automobiles brought week-end parties to nearly all the large country places of Nassau County, as well as a number in Suffolk County, where the Christmas festivities will continue until after the new year is ushered in.

All the Long Island macadam roads were in fine shape for automobiling, and the colony entirely dispensed with railroads and went to the various country places in large motors. At

Hempstead, Cedarhurst, Woodmere, Great Neck, Garden City, Wheatley Hills, and the Piping Rock and Nassau Country Clubs there was not a large place but had its full quota of visitors.

Though there has been but little wintry weather thus far this season, Long Island roads do not suffer to any appreciable extent from heavy snows, so that cars are in constant use between country places and the city throughout the winter. This applies more particularly to the western end, or macadamized sections. The Jericho turnpike is now improved as far as the county line.

THAT NEW YORK CITY ORDINANCE CONCERNING USE OF CHAINS

THROUGH the activity of Chairman Charles T. Terry, of the A. A. A. Legislative Board, representatives of city, state, and national automobile organizations protested to the Park Board of Greater New York at a hearing, held Thursday, December 26, against the recently enacted ordinance which forbids the use of chains on wheels of vehicles entering the park or driving on park thoroughfares anywhere in Greater New York. Believing that the acceptance of such an ordinance without a protest and test of its legality might bring about general adoption of similar measures in cities throughout the entire country, Chairman Terry called the automobilists together. A conference at A. A. A. headquarters, No. 437 Fifth avenue, preceded the hearing at the Arsenal in Central Park.

W. W. Niles and A. R. Shattuck represented the Automobile Club of America; Russell A. Field appeared for the Long Island Automobile Club; Melvin Bender spoke for the New York State Automobile Association, and, of course, Chairman Terry represented the national organization. Alexander Schwalbach appeared for the Good Roads Association of Brooklyn. The three Park Commissioners of Greater New York were all present, with Mr. Smith of Manhattan Borough presiding.

Before the protestants began, Commissioner Smith advised that the legal aspect of the matter was not to be discussed, as the ordinance had been framed by the Corporation Counsel. Mr. Bender, of the State Association, was the first speaker. He said that it was absurd to restrict any more than necessary the traffic of automobiles in the parks, which were primarily designed for pleasure purposes. The driveways were limited altogether to pleasure vehicles, and automobiles constituted today a large part of such vehicles.

Chains, he declared, were necessary in metropolitan districts, where the lives of pedestrians were imperiled if a machine were unable to come to a quick stop. The chains prevented skidding, that was otherwise inevitable in muddy or cold weather. If the park authorities forced them to comply with the regulations they must stand responsible for the consequences, he said.

He added that even New Jersey, regarded as the mother of automobile persecution, had no measures so drastic as the recent park ordinance. The use of chains on motor vehicles is prohibited on the parkways, but is allowed when the weather conditions make it dangerous both to the occupants of the automobile and those who use the driveways. Even the steel calks on the horses' hoofs were more injurious to the roads than the smooth link chains which were universally used on tires.

In conclusion he questioned the authority of the board to make such a mandatory regulation. By the city charter they were empowered to regulate traffic, but that did not give them the power to restrict pleasure vehicles, he said.

Hiram Percy Maxim, of the Mechanical Branch of the Asso-

ciation of Licensed Automobile Manufacturers, next discussed the ordinance and gave his opinion of the injury that a road suffered by the use of chains on automobile wheels. He said that it was the only expedient that ten years of study of the problem brought forth. He told of his investigations made on an endurance run when he examined a macadamized road after a hundred machines had passed over it, every one of the automobiles bearing the chains. The road, he said, had sustained no damage. The soft bed of the road after stormy weather and the pneumatic cushion of the tire, according to his view, absorbs the chains, without inflicting any appreciable injury to the road.

Mr. Terry argued that the present roads were inadequate for modern traffic. In the evolution of locomotion, the roads have failed to keep pace. They are the same now as they were long before the discovery of the automobile. A new surface should be applied to the driveways, so that they would be able to sustain the strain of automobile traffic. The bad effect of the New York ordinance would travel to other cities, which patterned their regulations after the metropolis, he declared.

The popular impression that automobilists are superior to the law, declared Mr. Niles, had gained considerable ground, but it was entirely erroneous. They were more amenable to reasonable legislation than any other class of people, but in this instance he thought that their good nature had been violated. The enforcement of the new ordinance in the Bronx would be greatly felt, as the only roads worth traveling over in a motor car are those under the direction of the Park Department. To compel automobiles to go without chains on wheels would drive them to the other thoroughfares which were in bad condition.

For the preservation of the roads Mr. Shattuck suggested an emulsion composed of water, soft soap and oil. This formula is now being used with much success in Boston. Commissioner Smith said that the department had experimented with the emulsion, but the cold weather had forced postponement until another season of the year.

Mr. Field confirmed what the others had stated and added other convincing facts.

P. W. Strong was the final protestant, who asserted that smooth tires without chains did more damage to the roads than the chain-bearing wheels.

At the conclusion of the hearing, the Automobile Club of America offered to have tests to show the Board the effects of the tires upon the roads in various weather conditions. Commissioner Smith appreciated the offer and said the club would be called upon if the Board considered it advisable to have such tests.

Future developments will be awaited with much interest, for the automobilists do not intend to accept the ordinance without a further protest and possibly legal action.

BUT THE AMENDMENT WAS VOTED DOWN.

PHILADELPHIA, Dec. 30.—Although in the present conditions of affairs in Philadelphia, the "gang" has things pretty much its own way, the reformers still have a few watchdogs in councils who keep tab on their confrères. The other day when an ordinance was introduced calling for an appropriation of \$5,000 for the purchase of an automobile for the use of the chief of the highway bureau, Councilman Lambirth created not a little consternation by proposing an amendment providing that the car should bear on both sides the words "The Department of Public Works." Such a proposition, it was objected, was insulting, and the amendment was accordingly voted down.

TENDENCY FOR BUYING BECOMING APPARENT.

CLEVELAND, O., Dec. 30.—At this season of the year the demand for automobiles for immediate delivery is not as strong as in the Spring, the demand in most cases being for limousines and landaulets. During the past two weeks orders have been coming in rapidly to the offices of the Peerless Motor Car Company, which shows the tendency for heavier buying after the first of the year. The Peerless Company has kept a sufficient corps of men at work every day to supply the demand for their cars and within the past week have increased this force.

The new buildings commenced early in the fall are now ready for occupancy and the drafting room and office are in use.

NEW YEAR FULL OF PROMISE FOR THE CLUBS

HARRISBURG TO PHILADELPHIA, AND RETURN.

HARRISBURG, PA., Dec. 30.—The Motor Club of Harrisburg will hold its second annual endurance run May 4 and 5, and active steps are already under way for the big event. The contest committee has decided to make the 1908 tour to Philadelphia and return, with an increased mileage each day over last season's hard test. The route for the first day will lead through Lebanon, Reading, Kutztown, Allentown, and then on to Philadelphia, where the night control will be established. This course will be almost 150 miles. On the return trip the route will lead through Norristown, Pottstown, Reading, Lancaster, and to Harrisburg, a mileage of about 130 miles.

The rules which the committee are now considering will be much stricter than those for the initial contest. All bonnets and tool boxes will be sealed, and cars and engines will be required to be kept running at all times except when the rules of the roads or punctures require a stop. Penalties will be given for all gasoline, oil, and water taken on after the official start of each day, and after the run a technical committee will examine all cars for any material breaks or defects.

The rules and penalties will be made clear to all contestants through a table which will show the penalties in points which can be registered against any car. There will be four classes, viz.: Touring cars costing \$2,500 or over; touring cars costing less than \$2,500; runabouts costing \$2,000 or over, and runabouts costing less than \$2,000. In addition to the four trophies for the 1908 run the four touring cars which were tied for the 1907 trophy will contest for its permanent ownership. These cars are the White of W. C. White, the Pullman of E. G. Irvin, the Thomas of S. K. Hamburger, and the Pierce Arrow of H. F. Rawll.

YORK (PA.) CLUB WANTS SOME RACING.

YORK, PA., Dec. 30.—Enthusied by the success of other racing meets held recently in this part of the Keystone State, members of the York Automobile Association are contemplating the holding of several big meets here next season. Officials of the York Motor Car Company, including H. R. Averill, sales manager, have announced that they are ready and willing to foster the auto racing sport here and it has been suggested that a mile track be placed in condition at the grounds of the York County Agricultural Society. The present half-mile track at the fair grounds is one of the best in the State for horse racing, and it is overlapped by a mile track. This is used at present for training purposes. Local auto enthusiasts are of the opinion that it would take little expense to place the mile track in good shape, including the banking and fencing of it. The plans of the Yorkers are that at least three race meets be held here each season. Mile tracks in this part of the country are more than a luxury and the York autoists propose to start the innovation in the early Spring.

BAY STATERS HAVE A NEW YEAR'S TREE.

BOSTON, Dec. 31.—The annual meeting of the Bay State Automobile Association for the election of officers and the transaction of other business will be held at the clubhouse on Monday, January 6.

To-night, in accordance with a long-standing custom, the annual Christmas tree and New Year's celebration was held. The Christmas tree was arranged by the house committee and provided a large amount of amusement for the many members who were present. The gifts were selected with care by the committee and nobody present failed to receive a remembrance.

MASSACHUSETTS MIGHT SUPPLY A CUP COURSE.

WORCESTER, MASS., Dec. 30.—The Worcester Automobile Club as usual will aid and abet the Massachusetts State Automobile Association in its legislative and other work this season financially and otherwise. At a meeting of the Board of Governors, Saturday night, it was voted that the club appropriate \$300 for the State association over and above the regular dues which are paid, in order to assist the State officers in the work of looking after the interests of the autoists of the State at the State house this winter.

In common with the rest of the clubs, Worcester club is insistent in its support of the "light bill" calling for lights on all classes of vehicles using the public highways at night, and the bill which was introduced last year giving to mayors and aldermen of cities and selectmen of towns the right to set apart sections of highways for automobile events the same as they can do now for horse, bicycle, and foot races, will be pushed again this year.

A smoker at which aeronautics will be the chief topic is planned for the club the latter part of January and a dance in the club hall is another event which is due about January 14.

Through tourists on the New York-Boston route between Worcester and Springfield will find the highway a hard one. George Stowe made the more than 100 miles to Springfield and back yesterday in his White steamer. "There's everything there to make bad riding," he said afterward. Mud, ruts, snow and ice are in the combination.

BUFFALO'S CLUB PROSPEROUS AND HUSTLING.

BUFFALO, N. Y., Dec. 30.—According to the annual report of the treasurer at the recent annual meeting of the Automobile Club of Buffalo, that organization has \$3,357 in its treasury, \$2,500 of which has been deposited in the American Savings Bank as the nucleus of a country clubhouse fund. The present membership is rapidly approaching the 1,200 mark, and the newly elected president, Frank B. Hower, intends, with the cooperation of Secretary Dai H. Lewis, to make it the largest automobile club in the country before 1908 is concluded.

President William H. Hotchkiss, of the American Automobile Association, is the father of the local club, and in the course of his remarks at the annual meeting, which was attended by over 350 members, he complimented the club upon the size and character of the assemblage and said there was not another club in the United States which could gather so many members together on such an occasion. He exhorted the members to keep up the present spirit and to maintain a big and enthusiastic working club, democratic in character, where owner, driver, mechanic, agent and maker could meet and work for the general benefit.

The retiring president, Seymour P. White, was presented a silver loving cup, E. H. Butler, proprietor of the Buffalo *News*, being the spokesman. Charles Clifton and E. R. Thomas are on the club's board of governors, on which Mr. Butler also serves.

A. C. OF TOLEDO ORGANIZES AND ELECTS.

TOLEDO, O., Dec. 30.—The Automobile Club of Toledo is now organized and an applicant for membership in the Ohio State Automobile Association. The club starts with 125 charter members, and these officers were selected for the ensuing year: President, E. D. Libbey; vice-president, E. J. Marshall; treasurer, J. M. Steenberg; secretary, George S. Mills. The board of governors chosen consists of the above officers and the following: Marshall Sheppey, W. W. Morrison, John Mockett, J. J. Manning and F. M. Brigham.

BOSTON TRADE CHANGES FOR THE NEW YEAR

BOSTON, Jan. 1.—The New Year brought with it a number of changes in the local automobile trade and, though there are still some agencies of well-known cars to be placed, the trade in general is pretty well settled down for the coming season's business. One of the most interesting announcements comes from the Studebaker Automobile Company, of South Bend, whose product of gasoline and electric pleasure and commercial vehicles has been represented here for a number of years by agents. Early in the New Year this company will discontinue its agency and will open a branch house in the newer automobile section on Boylston street. The company also proposes to construct a fireproof garage with complete accommodations for gasoline and electric vehicles and with a fully equipped repair shop and a complete line of parts for all its models. W. R. Daniels, treasurer of the Prentiss Motor Car & Supply Company, which has represented the Studebaker line in Boston, will become manager of the branch.

The removal of the Studebaker agency from Berkeley street near Tremont about closes out that automobile section, which once was the home of such well-known cars as the White, Buick, Locomobile, Aerocar, American Mors, and others. Nearly

all these cars are now sold in the newer section in the vicinity of Boylston street and Massachusetts avenue.

Another interesting New Year's change is the opening of the new Thomas agency, also in upper Boylston street. The agency for the Thomas is in the hands of the Whitten-Gilmore Company, composed of Charles Whitten, long and favorably known as an automobile dealer in Lynn, and E. A. Gilmore, recently connected with the White Company in New York and previous to that manager of the Rambler New England branch in Boston. The company's new store, which has been remodeled for it from an apartment house, is next to the salesrooms of the J. W. Bowman Company, agents for the Stevens-Duryea.

Still another newcomer on Boylston street is the branch of the Panhard & Levassor American agency. George T. Gould comes from New York as the manager of the branch and the company is preparing to make a greater effort than ever before to secure a larger share of the Boston business for foreign machines. H. C. Stratton, who handles the American Mercedes, Car de Luxe and Kissel Kar, has also moved to Boylston street from the quarters he occupied formerly in the building of the Back Bay Automobile Company on Huntington avenue.

WALTER C. WHITE'S EUROPEAN IMPRESSIONS.

Walter C. White, second vice-president of The White Company, has returned from his annual visit to the London and Paris shows. In speaking of his trip Mr. White said:

"Although there is undoubtedly an oversupply of certain types of cars in the European market, the business in White steamers is unaffected. On the contrary, foreign business is growing season by season as the advantages of our distinctive type become more widely recognized. During the last season the White won all three of what are known as the 'desirability contests,' namely, the London Town Carriage competition, the Dust Trials, and the South Harting hill-climb. The latter was primarily an efficiency contest wherein first award was made to the White because it developed at the rear wheels a greater proportion of its assigned horsepower than did any other car, the rating assigned to the White by the Royal Automobile Club, which conducted the test, being 50 horsepower. The prize in the latter contest, by the way, known as the Yellow Trophy, is one of the handsomest I have ever seen. It is a massive gold cup of classic design and some idea of its value may be gathered from the fact that, before placing it on exhibition we insured it for £500 sterling."

EFFECTIVE HOLIDAY WORK OF THE AUTOS.

INDIANAPOLIS, IND., Dec. 30.—At Christmas time the automobile plays a very prominent part in promoting happiness among the unfortunates of the city, in addition to expediting the delivery of parcels for the department stores. In connection with its Christmas charity work, the *Star* this year took the inmates of the Indiana Institute for the Blind to the various charitable and penal institutions of the city to sing carols.

Automobiles were loaned by the Premier Motor Manufacturing Company, the National Motor Car Company, the Indiana Automobile Company, Gibson Automobile Company, Nordyke & Marmon, Hugh J. McGowan, and Louis G. Beschler.

The Indianapolis *News*, each year, from contributions given by the public, purchases provisions and gives them to old and unfortunate people of the city. This year the work of delivering the 200 baskets was done voluntarily by the Premier Motor Manufacturing Company, about a dozen Premier touring cars being loaned for the purpose.

POPE-TOLEDO MAY PARTICIPATE IN GRAND PRIX.

TOLEDO, O., Dec. 30.—From the Pope Motor Car Company the following press notice has appeared:

"It is said there is some talk of the Pope-Toledo all-chrome-nickel steel racer being leased by a French syndicate for racing purposes on the Continent. This is the racing car built by the Pope-Toledo for the 1907 Vanderbilt race, which was postponed. The car was pronounced by experts to be the finest racing machine ever built. While nothing, one way or the other, can be learned from either parties, it is very doubtful if the owners will permit this car to leave America unless it goes to bring home a foreign cup."

The impression prevails that the Pope Company intends to make an entry in the Grand Prix of France, to be held in July next. It will be remembered that Lytle and Dingley were Pope-Toledo racers in the Gordon Bennett race of 1905, and the company has always been greatly interested in speed contests. It is expected in the near future a definite announcement may be made concerning the Grand Prix entry.

PHILADELPHIA'S LATEST BIG GARAGE.

PHILADELPHIA, PA., Dec. 30.—That the financial flare-up has not materially affected the local automobile trade was demonstrated last Thursday, when the first spadeful of earth was turned in digging the foundations for what will be one of the largest garages in the United States. No less than eight buildings now standing at Nos. 229 to 243 North Broad street will be torn down to make room for the improvement. Henry C. Lea is head of the concern which will operate this enormous garage, which will be erected by the William Steele & Sons Company, after plans by Watson & Huckel, architects.

The North Philadelphia Auto Station was last week awarded the local agency for the Garford car. David Sykes and Frank Le Flem are at the head of this concern, which has a garage and salesroom at 3425 North Broad street.

A FOUR-YEAR-OLD AUTO OWNER.

BOSTON, Dec. 30.—It is believed that the youngest owner of an automobile in Massachusetts is the four-year-old son of Dr. George L. Black, of Lawrence, who recently came into the possession of a new Maxwell runabout by holding the winning ticket in a contest run by the Knights of Columbus of Salem.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Holsman Automobile Company's factory at Chicago was shut down during the holiday week just past, in order to give an opportunity for inventory taking.

The San Francisco branch of the Winton Company is now housed in its permanent home at Van Ness and Grove avenues. This building was erected on plans devised by the Winton people and is one of the best arranged motor car establishments in the West.

The Walden W. Shaw Company, Chicago, are now occupying their new quarters at Twenty-first street and Michigan avenue, where the full lines of the Berliet, Reo and Premier cars are on exhibition. The Shaw company now occupies the most southerly location on the "row" and has one of the finest automobile buildings in Chicago.

Among the prominent American cars on which the Truffault-Hartford shock absorbers are now fitted as part of the regular equipment are the Pierce Arrow, Studebaker, Stevens-Duryea, Stoddard-Dayton, Marmon, Locomobile and Acme—a list of which the makers of the shock absorbers may well point to with pride.

The \$2,500 contest for the drivers of Winton "Six-teen-six" cars will soon be on in earnest, the awards being scheduled for July 1, 1908. The ten drivers who show the smallest repairs on at least 3,000 miles running will divide the money, the first prize being \$1,000; second, \$500; third, \$250; fourth, \$150, and the fifth to tenth, \$100 each.

"Increased sales of high-grade tires and hard times would hardly seem to go together very well," says E. H. Broadwell, "but whatever effect the financial depression may have upon the sale of automobiles, the sales of the highest-priced tires are better now than they were at the corresponding time last year, and the prospects are that they will better throughout 1908."

Manager Frank Eveland of A. G. Spalding & Bros. is very enthusiastic over the proposed spring show to be held at some such place as Morris Park in connection with a race meet, both to be conducted by the New York Automobile Trade Association. "Unquestionably it is the very thing the dealers and the public will want at that time of the year," said Mr. Eveland.

After one of the most strenuous runs imaginable, the White steamer which recently left Chicago with the Stepney spare wheel expedition, arrived at St. Louis. The party consisted of Edward Grant, Edward Van Lunn, L. F. Chaney and a representative of the Chicago Motor Club. Both the car and the spare wheel came through the test in fine style, but the men were exhausted from the exposure.

A new and pleasingly colored hanger just issued by Wheeler & Schebler, Indianapolis, Ind., neatly illustrates the "heart of the automobile" by drawing the bonnet of the auto shown in the picture in heart-shaped form and depicting a Schebler carburetor in gold color on its front. A typical automobile girl with hand grasping the steering wheel is stepping aboard the machine. The design of the whole subject is very effective.

The Jeannin Automobile and Manufacturing Company, 1223 No. Vandeventer avenue, St. Louis, Mo., has been incor-

porated, and commenced to manufacture a two-cylinder motor of the double-opposed type with offset cylinders, especially designed for use in the buggy type of automobiles. Later it is the intention of the company to bring out a small delivery car, and also some other automobile parts. E. P. Fritschle is president; H. W. Jeannin, superintendent, and W. Goener, secretary.

"Keep your motor warm," is the advice of H. E. Coffin, vice-president of the E. R. Thomas Detroit Company. "In the winter weather, when a car is run at speed, the cooling properties of the radiator are much greater than in warmer weather. A motor will run better and start easier if a sheet of cardboard or other light material covers part of the radiator." Mr. Coffin says this advice applies particularly to the Thomas Detroit, the unusually effective cooling system of which is designed to keep the motor cool when run to the limit of its power in the hottest climates.

The Michelin demountable rim, which is being placed on the market by the Michelin Tire Company, is receiving emphatic commendation from autoists at the Importers' Salon this week. The device is so designed that it combines ease of removal with closeness of adhesion—a positive fastening to the wheel rim. The extra rim is carried with its tire attached and already inflated. In case of puncture several bolts are loosened, the old tire slipped off, and the new tire, fully inflated, is slipped on, rim and all. The bolts are then tightened and the operation is complete. The time saved alone is a great factor.

"Whatever may be said about the effect of the recent financial flurry on the sales of pleasure motor vehicles in general," said an official of the Studebaker Company recently, "there is one type of automobile that is receiving more attention than ever before, and that is the electric delivery wagon and truck. Business men are coming to regard this type as a money earner for its owner. Up-to-date concerns all over the country, who have studied the subject of local transportation in all its various phases, are now substituting the electric power wagon for horse delivery; not alone because it gives more satisfactory service, but mainly because it is in the interest of business economy to do so."

One big move that marked the first day of 1908 on New York's automobile row was that of the Rainier Motor Car Company from Broadway and Fiftieth street to its new home on the corner of Fifty-sixth street and Broadway. Although the present Rainier place was built especially for the company a few years ago, it has so far outgrown it that the business had to be distributed through three different buildings. In the new five-story headquarters all this business of salesrooms, offices, garage and machine shop will be gathered under one roof, and the facilities for the company's policy of keeping customers' cars in repair will be greatly improved.

NEW AGENCIES ESTABLISHED.

During the past week three new agencies have been added to the dealers' list of the Franklin Automobile Company, as follows: J. Mount, Red Bank, N. J.; Robert Harmon, Portland, Me.; Guy L. Smith, Omaha, Neb.

The Studebaker Automobile Company has opened a local salesroom in Cleveland for the sale of its electrics. The location is on Euclid avenue near Twentieth street, and Alvin H. Smith, formerly of the Central Automobile Company, will be manager.

The Rambler Automobile Company, Omaha, Neb., has just taken the agency for the Mitchell line of cars, and as buyers in this territory are keen for medium-priced cars that do not balk on the numerous lovely specimens of hills with which the country abounds, the Mitchell cars, which have already shown their ability in this line, will be largely favored.

The Northern Motor Car Company has just closed an agency contract with the Chicago Vulcanizing Company which will put its sign up in Chicago's automobile district in the near future under the name of the Northern Automobile Company. The company will represent the Northern in Chicago, and in the greater part of the State of Illinois. Other Northern agencies just placed are the Oklahoma Motor Car Company, Oklahoma City, Okla.; Humphreys, Schloot & Company, Linton, Ind.; C. J. Layton, Danville, Ill.; H. C. Griesinger, Santa Cruz, Cal.

PERSONAL TRADE MENTION.

H. M. Chambers, who has long been identified with the automobile business in Chicago, has joined the selling force of the Studebaker Chicago branch.

B. F. Blaney, who has been connected with the Corbin Motor Vehicle Company, of Boston, 87 Church street, the Motor Mart, as secretary, has just severed his connections with that concern. His plans for the future will be announced a little later.

Herbert L. Averill, sales manager of the York Motor Car Company, York, Pa., has returned from a week's business trip to Buffalo and the middle west, in the interest of the Pullman. He is one of the official observers in the New Year's endurance run of the Quaker City Motor Club of Philadelphia.

The E. R. Thomas Detroit Company has added to its force W. H. H. Hutton, for five years purchasing agent of the Northern Motor Car Company, and recently manager of the Port Huron factory. He will work in connection with F. O. Bezner in the purchasing department of the Thomas-Detroit factory.

David J. Moreland, for several years field representative of the Rapid Motor Vehicle Company, Pontiac, Mich., has been promoted to the position of superintendent, a position well earned by faithful service and exceptional knowledge of the Rapid line. It is the intention of the Rapid Motor Vehicle Company to greatly increase its output in 1908.

Edgar Apperson, of the Apperson Brothers Automobile Company, of Kokomo, Ind., left last week for a visit to Los Angeles, where he will remain about a month. Though his trip is principally undertaken for pleasure, he will look into automobile conditions on the Pacific Coast very carefully, particularly as they apply to the sale of Apperson cars, while he is in that territory.

NEW TRADE PUBLICATIONS.

An interesting booklet entitled "About Graphite Paint" has been published by the United States Graphite Company, Saginaw, Mich., and will be sent upon request to all those interested in this subject.

Rambler lines for 1908 are given an advance presentation in a catalogue just issued from the Thomas B. Jeffery & Company factory at Kenosha, Wis. The two and four-cylinder models are described and illustrations given of the various touring cars and roadsters.

"The Shooting Oiler" is the title adopted by the Precision Appliance Company, Chicago, in describing the Hill pre-

cision oiler for automobiles and motor boats. A full description of the mechanical features of the oiler is given in the booklet, all the mechanical parts being illustrated.

How Logan three and one-ton trucks are built, how they are operated, and what they are capable of doing, forms the subject matter of the catalogue of the Logan Construction Company, at Chillicothe, O. A correct idea of the structural features of the trucks can be gained by the numerous halftone illustrations.

Among a batch of Babcock publications, the most noticeable feature is a dainty blue and gold-covered catalogue on the electrics produced at the Bab-

cock Electric Carriage Company's works, Buffalo, N. Y. A striking two-page illustration shows a group of Babcock electricians, evidently in the hands of satisfied owners, photographed in Delaware Park, Buffalo.

The account of how one lady went through the Glidden tour is told in an illustrated folder published by the Rainier Company by Mrs. J. N. Cuneo herself. The lady driver has something to say on the way her Rainier stood up under the terrible pounding to which it was subjected in the sixteen-day run from Cleveland to New York; but the illustrations reveal, even better than words, the severe ordeal to which both car and driver were put.

Cars for Sale

ABSOLUTE closing out sale of the largest stock of new and second-hand automobiles in the United States; write for Clearance Sale List No. 20; now is the time to buy. Rochester Automobile Co., Jos. J. Mandery, Prop., Rochester, N. Y.

A BARGAIN—1907, 20-h.p., 4-cylinder Model G Cadillac runabout; best of condition; demonstration at any time. Address Morgan & Wright, 214 West 47th St., New York.

AUTOMOBILE—Four-cylinder Pierce limousine; just completely overhauled. Address 916 Frick Bldg., Pittsburg, Pa. Telephone, Court 1052.

AUTOMOBILES—No reasonable offer refused; Franklin runabout and touring car; Pope-Hartford, single and four cylinders; Electric, Cadillac, Doctor's Stanhope, Compound '07; lot of tires, all sizes. P. O. Box 540, Hartford, Conn.

AUTOMOBILES—30-h.p. Pierce-Arrow, 1906, \$2,000; 24-h.p., 4-cylinder Ford, \$600; 26-h.p. Rambler, \$700; 50-h.p. Thomas Flyer, \$1,500; Cadillac delivery car, \$350; 30-h.p. Model H Cadillac, \$1,500; 30-h.p. Peerless, \$1,000; these are great bargains, but must be sold. E. R. Clark Auto Co., 461 Worthington St., Springfield, Mass.

AUTOMOBILES at your own price. We have a complete assortment of slightly used and second-hand automobiles which will be sold regardless of their value, as we MUST have the room; positively the greatest opportunity ever offered; come early and secure a bargain. If you cannot come personally, communicate with us at once. The Starlin Company, 1094-1100 Main St., at St. Paul St., Buffalo, N. Y.

BARGAINS—Packard runabout, Packard touring, 1907, cheap; Rainier touring, Buick runabout, Lozier touring, Thomas limousine, Ford runabout, new, \$400. Vanderveer Bros., Times Bldg., 42nd St. and Broadway, New York City.

BUFFALO SALES DEPARTMENT demonstrator; refinished and thoroughly overhauled; complete catalogue equipment, including cape top and glass front; list price \$5,500; will sell at \$4,000. The George N. Pierce Company, Buffalo, N. Y.

BUICK MODEL F—New; never used; regular factory equipment; 1907 model; regular price \$1,250; will take \$900. "A." care The Automobile.

BUICK—Four-cylinder, Model D; equipped with gas and oil lamps, gas generator, extra tire, Allen tire holders and tire cover, Veeder dash odometer, \$125 top complete; run 987 miles, and is as good as new; cost, as equipped, \$2,275; sell for \$1,350; guaranteed all O.K. "B." care The Automobile.

CADILLAC RUNABOUT—Model K, excellent condition; complete with top, lamps and generator. The Hartford Rubber Works Co., Hartford, Conn.

ELMORE—1906, 24-h.p.; top, extra tire; in fine shape. J. F. McGurk, Shortsville, N. Y.

FINANCIAL STRINGENCY compels us to offer panic prices in Ford 6-cylinder, Franklin D. Maxwell H. and runabouts; Olds and Cadillac runabouts; it will pay you to write for list; we have bargains you can't duplicate. Automobile & Garage Co., Meyersdale, Pa.

FLANDAU BROUGHAM—Cost \$1,500 when new; only been run a short time; also new Victoria, never has been run, worth \$1,000; for sale, or will exchange for automobile high power gentleman's roadster. Address C. D. Jones, 701 Connel Bldg., Scranton, Pa.

FORD RUNABOUT—Four cylinders; searchlight, generator, side and tail lamps; condition perfect; color, dark green; \$385, cash. H. Coulson Fairchild, Passaic, N. J.

FORD RUNABOUT—1907, Model N; nearly new; bargain. 252 Fallsade Ave., Jersey City, N. J.

GARFORD WEEKLY LIST OF SECOND-HAND CARS:

- 75—Cleveland touring car, 1907 model, 30 to 35-h.p., excellent condition; exceptional opportunity; nearly new... \$1,275
 - 76—Packard Model N; excellent condition..... 950
 - 77—Packard runabout, 1907 model; used but few months..... 2,750
 - 78—Ford 6-cylinder, 1907 model; used but three months..... 1,750
 - 79—Rainier 1906 limousine; thoroughly overhauled..... 2,000
 - 80—Rainier 1907 touring car; fine condition..... 1,800
 - 81—Hotchkiss demilimousine, 1906 model; fine condition..... \$4,400
 - 82—Dorris, 30-35, 1907 model; five months old..... 850
 - 83—Packard touring car, 1906 model... 1,500
 - 84—Packard touring car, 1907 model... 2,500
- Also cars of many other makes at from \$500 up. The above cars have been placed with us for sale by parties ordering Garford cars. In making inquiries kindly mention serial number of car you may be interested in. Garford Motor Car Company of New York, 1540 Broadway, New York City.

GET WISE—We have anything you want in second-hand cars—Packard, Winton, Locomobiles, White steamers, Franklins, Buicks, Oldsmobiles—and bargains at that. Get our list for March. The Sid Black Automobile Co., 630 Walnut St., Cincinnati, Ohio.

HOW TO RUN AN AUTO

Are you Interested in Automobiles?

If you are, an early purchase of "HOMANS' SELF PROPELLED VEHICLES" will prove a good investment.

This work is now the accepted standard on the practical care and management of motor cars — explaining the principles of construction and operation in a clear and helpful way, and fully illustrated with many diagrams and drawings.

The presentation of subjects has been determined by consideration of the needs of the man behind the wheel. It is clear and concise in its treatment, and comprehensible to the most inexperienced automobilist, at the same time it is so thorough that the expert will learn much from its pages.

This good book will be sent to any address in the world, postpaid, upon receipt of two dollars, or if desired, will be sent on approval to be paid for after examination. Contains 608 pages, over 400 diagrams and illustrations, printed on fine paper, size 5 1/2 x 8 1/2 inches, with generously good binding. Highly endorsed.

50 money in advance returned, also and return This. Autol & Co., 63 Fifth Ave., N. Y. Kindly mail me copy of "HOMANS' AUTO" and if found satisfactory I will immediately remit \$2.00 on return book. NAME: _____ ADDRESS: _____ DATE: _____

WE WELD STEEL from the thinnest sheets up to one inch in thickness. Repair Crank Shafts, Frames, Rods, etc., of all descriptions. Our specialty is Exhaust Pipes, Mufflers and Tanks for all pressures. Prices right, deliveries prompt.

The Springfield No. 2—Ratchet Screw
 For cars weighing from 1,000 to 4,000 pounds.
 Height, 12 inches. Rise of screw, 7 inches. The
 base is made of malleable iron, heavily ribbed and
 dust-proof. The ratchet works in ground-tight en-
 gaging, from which both ratchet and screw are lubri-
 cated; one filling of grease being sufficient for a sea-
 son. The ratchet part is made of steel and hard-
 ened. When this Jack is not in use it is in a most
 compact form, all parts being locked together, and
 is absolutely rattle-proof. Weight 5 pounds.
 Price \$4.00, net.

 TRADE MARK

**CAN YOU BE CERTAIN YOU HAVE
 PICKED THE BEST CAR BEFORE
 YOU HAVE INVESTIGATED THIS ONE**
 You don't purchase a car to-day and another to-
 morrow. So why not be certain that you have the
 best before you make your final decision.
 The 1908 Model is the peer of any car of equal
 price. We don't expect to sell you a "Traveler"
 merely on this statement, but we do hope it will so
 arouse your curiosity that you will write for the
 proof. Do this now—to-day—before you place
 your order. Simply dictate the request—it is but
 a moment's work and later you will agree it was a
 moment well spent.

WHEN WRITING TO ADVERTISERS PLEASE MENTION THE AUTOMOBILE.

THE LEAVITT Improved Wipe Contact Timer

To meet a demand for a wipe contact timer we have improved upon the well-known Lacoste Timer by adding a supplementary ground terminal and an adjustable ball-bearing in place of the plain bearing. This eliminates the two principal faults of this timer, i.e., poor ground and wobbling after running a short time, both of which will cause skipping when running at high speed. The above faults are usually ascribed to the plugs, coils or carburetor.

Prest-O-Lite

Light Insurance
 Is Better Than
Life Insurance

"LIGHT Insurance" is a thousand times better than LIFE Insurance on a dark, cloudy night, when you're trying to make time over rough, bumpy roads with hidden dangers and obstacles before you. Equip your car with PREST-O-LITE and carry your "light insurance policy" right on the foot board. That's the only sure way to avoid bad accidents and exasperating delays. Prest-O-Lite turns night into day with its strong, steady, white light. It's much cleaner, safer and easier to operate than the ordinary, unreliable, treacherous gas generator.

No matter where you live, you can easily and quickly have your car equipped with Prest-O-Lite, for we now have 1,600 Prest-O-Lite stations scattered all over the country. At any one of these places you can buy a Prest-O-Lite tank or exchange an empty one for one that's filled.

Write for the New Prest-O-Lite Book and learn how to side-step the trouble, worry and accidents of night travel. And do it now—to-day. This interesting little booklet mailed to you at once. Send no stamps—just your name to

You Can Buy Satisfactory Finished Crank Shafts if you deal with us

We have proven this time and again to many of the most exacting automobile and engine manufacturers of the country. The crank shafts we are turning out are winning universal approval, due to the wearing qualities of material, and quality of workmanship and finish. Possibly you may be under the impression that what you are using are the best, or at least good enough. If so, it is because you have not tried those we are making. We can convince you of our claim if you will give us an opportunity. All we ask is to simply send blue print or detail drawing, for prices, if you desire a good article. Let us make a sample and submit for your inspection and test.

"TRIUMPH" GREASE

NO WASTE—NO WEAR

Works the same Winter and Summer, being
unaffected by heat or cold.

Never runs out. Owing to its heavy body it stays
where it is put and does not waste off like oil. Being
heavy-bodied, it always leaves a layer of grease be-
tween the opposing surfaces, reducing friction to a
minimum and saving wear. Its molecules are practi-
cally indestructible and it lasts in ACTUAL WORK
from 50 to 100 per cent. longer than other lubricants,
therefore is immensely cheaper. Send a trial order to-
day 10 lb. Can \$2.00. For sale by all dealers, or
send order direct to

Go South to the
Land of Sunshine
**Piney Woods
Inn**
Southern Pines,
N. C.

¶ Southern Pines, N.C., has been aptly termed the "Capitol of Sunshine Land." In the long leaf pine region, sandy soil, a mild, dry climate, tempered by the winds of the Gulf Stream. No fogs, no dews, no malaria. Pure spring water. ¶ Golf links surround Piney Woods Inn. No charge to hotel guests for use of links. Ideal conditions for golf prevail at Southern Pines. Not too cold—not too warm, and a "sporty" course in perfect condition. ¶ Saddle riding, tennis, trap shooting and all outdoor sports. ¶ No consumptives received. ¶ An elegant hotel. Rooms en suite with private baths. Rates \$2.50 to \$5.00 per day. **ST. JOHN & SON, Managers.** Parties en route for Pinehurst, Camden and all Florida points, should stop over at Piney Woods Inn—on the main line of the Seaboard Air Line. Superior passenger service: Pullman's latest cars. SEND FOR BOOKLET.

BUMPS

Have no terrors for the man who has Gabriel Shock-Absorbers on his car. The Gabriel Shock-Absorbers, by friction, retard the motion of the springs above and below their natural flexibility. Fitted to any car or any spring.

Ask for Gabriel Shock-Absorbers, Horn and Cut-Out Valve on your 1908 Car. Write for booklet and prices.

TIRES

ARE ALWAYS SATISFACTORY.

Years of study and experience are necessary to produce a tire that will prove satisfactory under all conditions. Our plant is devoted exclusively to the manufacture of pneumatic tires, and as pioneers in that line we have had the necessary experience, and the results of our close study in one line exclusively are shown in our line of 1908 tires.

Equip your cars with 1908 G & J Tires and Midgley Universal Rims, and you will have absolute tire protection.

MICHELIN

FRANCE, ENGLAND, ITALY, AMERICA.

Some motor car manufacturers and a good many AGENTS have not sold their cars. Not because the cars they built or sold were not powerful, fast, beautiful, roomy machines, for they were, but because these cars cost the owner so much to keep.

HIGH cost of up-keep is fatal to large and profitable sales. The largest item of up-keep cost is TIRE cost. The car owner who says "I went through an entire year on one set of tires" makes as many sales for the CAR he drove as for the make of tire he used.

Michelin's Tires reduce up-keep cost. They are famous the world over for durability and reliability. They are admittedly the Tire Standard of the world and EVERY MOTORIST KNOWS IT. Car buyers are DEMANDING Michelins today and GETTING them on their new cars. Agents are SPECIFYING Michelins and manufacturers—the able men of affairs who build the leading American cars—are EQUIPPING with Michelins.

MR. MANUFACTURER, how will your Agents sell their cars in 1908 in the face of competition which offers Michelins on cars of your price and class? You can AFFORD to equip with Michelins today. The public KNOWS it and your AGENTS know it.

See the Michelin Exhibit at the Importers' Salon. It is WORTH it.

MICHELIN TIRE CO., Milltown, N. J.

EXCLUSIVE

GREAT *Chadwick* SIXES

\$5,500.00 Touring Cars

Tourabouts Runabouts

It is becoming fashionable everywhere to own one. Only smart people of ample means can afford to buy one. Verily 'tis said that to him who hath shall be given.

A GREAT CHADWICK SIX is in reality the cheapest high-powered car for sale to the public. Notwithstanding the fact that it is easily the most powerful stock car built in the world, it will last and satisfy over a period of years, and its ability to go faster, to go slower, to always go and go more smoothly than any other motor car are facts we will prove by competitive tests.

If we could build CHADWICK SIXES better by putting into their cost of construction \$500 or \$1,000 more money, we would not hesitate to do so for an instant. The price would simply be advanced accordingly.

We will go further and state that THE GREAT CHADWICK SIX, in nimbleness and refinement, is as much superior to the so-called high grade American and European motor cars as the victorious motor boat "Irene" with its big CHADWICK motors compared to the old favorites which it so easily defeated for the International Cup and British Admiralty Trophy on the Hudson last September.

Ask any owner of a CHADWICK SIX about power and the control of it.

THE TAMPA BAY HOTEL,
TAMPA, FLA.

The Land of Lovely Dreams

WHERE THE KNOTTED NORTHERN
NERVES MAY RELAX AND REST

WHY should one go to Tampa rather than the resorts on the other coast of Florida? Because the climate of the west coast is far more equable, less enervating, more beneficial to nerves and mind than any other. The climate of Tampa is dry and its tropical warmth is tempered agreeably by westerly breezes from the Gulf of Mexico. While

the glorious sunshine in the day time reminds one of the close proximity of the tropical Everglades, night brings with it refreshing coolness and fragrant dews, and with them comes, without fail, "Nature's sweet restorer, balmy sleep." Apply to agents of The Seaboard Air Line Railway, The Atlantic Coast Railway, Southern Railway, and their connecting lines.

Booklet and Tariff sent on application.

BREECH-BLOCK

BETTER VALUE THAN ANY OTHER PLUG MADE

Insures cleanliness, freedom from the "fussed-up," uncomfortable condition consequent of working around a hot engine, and, best of all, insures comparative freedom from faulty ignition.

Eliminates Your Sparking-Plug Troubles

SAVES TIME, TOOLS, TEMPER and TROUBLE
No other Plug possesses so many distinct advantages of value and efficiency.

The Breech-Block enables the operator to open and clean the plug in four seconds

One-sixth turn of the handle opens
Entire porcelain is exposed for cleaning
One twist makes instantly white
Locks with the push of a finger
Tight to 2,000 pounds
No Wrench to get, use or replace
Terminal clips with each plug
No thumb-nuts to loosen. No pliers
Stuffing-nut chambered

Plugs held by their handle in testing
Not balanced on edge of your engine
Soot-proof to the limit
Unaffected by oil
Chambered end protects porcelain
Keeps porcelain fragments from cylinder
Slightest piston movement cleans points
Makes starting easy; fires first charge
Big cars run slow on high gear
Closely throttled; not a skip

INSIST ON HAVING THE "BREECH-BLOCK" PLUG
Every possible requirement completely satisfied

The New Diamond Chrome-Nickel-Steel Chain

is the latest advance in the automobile industry. It is lighter than any other chain of equal width and pitch, but has greater tensile strength and safely does harder work.

The Chrome-nickel-steel side bars cushion severe blows from the engine without permanently stretching, and the tough and hard nickel-steel rivets resist wear better than any other material known for the purpose. That is why the pitch of Diamond Chains does not change.

All metal in Diamond Chains is made for us especially for use in chain parts. Our method of hardening makes rivets which positively will not crack nor break. Other facts about Diamond Chains are given in our book on "Chain Power Transmission," sent free on request.

NON-FLUID OILS

It is Friction — Not Work — That Wears Out Machinery

Perhaps you never thought of it that way before. Friction is simply lack of sufficient lubrication. Oiling the outside of a machine doesn't lubricate the bearings, but it's a fact that anybody can verify that most machinery needs wiping oftener than it needs oiling.

Grease isn't a wholly good lubricant because it demands frictional heat to soften it before it even begins to lubricate.

Logically and practically Non-Fluid Oils—"the oils which do not drip"—deserve their widespread recognition as the best known solution of the problem of cleanly, efficient and wholly economical lubrication.

Write for free samples or go to your dealer.

**Proof Against
Wheel Accident**

**Indestructible
Steel Wheels**

are the only absolutely safe, always reliable wheels for your runabout, touring car, wagon, or truck. They have been proven mechanically perfect by the severest test an automobile was ever subjected to. **Indestructible Steel Wheels** are the only wheels made that cannot collapse. They stand up under the most terrific strain from heavy loads, great speed and rough roads. Are in constant increasing use on commercial vehicles of all descriptions, Fire Patrols, and pleasure cars in cross-country touring. Everywhere that wheel strength is required.

Indestructible Steel Wheels

are stronger, lighter, faster, cleaner, truer, and cheaper than other wheels, and are being adopted throughout the country as standard equipment. Our open-pattern wheel is transparent when in motion and makes a handsome appearance on your pleasure car, as well as being proof against wheel accidents.

Write to-day for catalog and prices on a set of Indestructible Steel Wheels attached to the present hub and rim of your car.

We make all kinds of Automobile Steel Stampings.

THE LAMP OF QUALITY

Every Autoist is Interested in that which Makes Good

PHOEBUS LAMPS
Make Good

We sell our goods by telling the truth about them—we claim nothing exclusive unless it is exclusive. Certain makers of lamps state that a removable lens is an exclusive feature of their lamps, and yet both our front glass and back lens are removable. Perhaps it's a coincidence only? We have the same convenience on the PHOEBUS Lamps and a lot of other good features which NO other make of lamp embodies. We tell you fully in our catalogue what these features are—you can have one for the asking.

Our No. 202, illustrated above, is a standard. Extra heavy gauge brass, reinforced front and back, full size B & L Mangin Mirror, adjustable focus, extra heavy front glass.

TRUFFAULT-HARTFORD SHOCK ABSORBER

The Device that made Safe, Speedy and Comfortable Automobiling Possible

The spring action of a car affects its smooth running qualities. Proper control of the springs prevents excessive oscillation, which insures less wear and tear, longer life of tires, greater speed and genuine comfort

This control of the springs can be secured only by the use of the Truffault-Hartford Shock Absorber. The device that makes cobblestones and rough roads seem like asphalt. Write for Rough Road Booklet to Department G.

HARTFORD SUSPENSION CO.

The Best Resolution You Can Make For 1908

Is to refuse absolutely to accept "just as good" or "better" tires as substitutes for Morgan & Wright's.

MORGAN & WRIGHT TIRES ARE GOOD TIRES

All Styles of Treads.

Morgan & Wright, Detroit

Branches, Agencies or Dealers everywhere

"KEEP YOUR EYE ON CONTINENTALS."

Continental TIRES

"Ready-Flated" Tires. These tires are the sensation of the season. They are carried already inflated on Continental Demountable Rims, ready for instant use in replacing a tire that is punctured. Exhibited at the Importers Salon, New York. Can also be seen at any of our branches or agencies or at dealers in motor supplies throughout the country.

"Rouge-Ferre" (Anti-Skid). This is the standard Anti-Skid Tire of the world. Steel studs with rivet heads are embedded in the tread during the process of manufacture, and are so firmly held in position that they cannot work loose or be torn out. Cars equipped with these tires are guaranteed not to skid under any conditions. These tires can be used in parks and on drives and boulevards where chains are prohibited by the local authorities.

The Importers' Salon. This exhibition, at Madison Square Garden, New York, is universally admitted to be the most beautiful and highest class display of automobiles ever given on the continent, the interior decorative effect of the Garden being a masterpiece of art, and the cars on display being valued at from \$3,500 to \$15,000 each.

On these magnificent cars there were more Continentals than any other tires.

New Prices. Continental Tires are offered this season on a new schedule of prices more favorable to the purchaser than any previously made by us. The immense volume of business that has come to us from our branches all over the world enables us to manufacture with greater economy without lowering the quality of the tires. Continentals are known as "the low cost per mile tires." They have a larger sale than any other tire which is some indication of the way they are regarded by motorists generally

*"You
Get
What
You
Pay
For."*

When we began the manufacturing of speed indicators we promised ourselves that quality should rule above all other considerations. That promise has never been broken. We believed then, as we do now, that quality and honesty and fair dealing could be made to pay dividends. How well that belief has been borne out is best told by the fact that

The Warner Auto-Meter

was on 70 per cent of the Glidden Tour 1907 contesting cars and on 60 per cent of the cars entered in the Glidden 1906 Tour. That the Warner Magnetic principle of speed indication is the only one is proved by the fact that it has been adopted by the United States Government to show the velocity of the wind. Uncle Sam wants the best—a poor speed indicator is worse than none—he knows that he can't get a reliable one for less than the Warner price.

Write for Complete Information.

presents more really remarkable features than you will find in any other car now offered, no matter its country or price.

¶ There isn't a detail that a perfect car should have that is *missing* from 1908 Cleveland. There isn't a detail that is unworthy of absolute motor car perfection that is *present* in the 1908 Cleveland. Every feature could be made a special "selling feature."

¶ Such features, for instance, as ignition, lubrication, brakes, and a novel ratchet-sprag, you will find distinctively new. But its many features are so notably in advance of any car so far built that you will have to examine it in detail to appreciate its intrinsic merit.

¶ And just consider for a moment the extraordinarily low price at which this 40-45 H. P. Cleveland is offered.

¶ If you are not sure just what dealer is handling this car nearest to your home, just drop us a line and we will immediately advise you of his name and address, and enclose a request that he furnish you with a complete demonstration at your best convenience.

¶ If you are a dealer, and have not yet gotten into communication with us concerning this 1908 Cleveland—get busy! It is bound to be the selling sensation of 1908.

CLEVELAND MOTOR CAR COMPANY

GENERAL OFFICES AND SALESROOMS:
1659 Broadway, New York City

Stevens-Duryea Six-Cylinder Automobiles

The wise automobile buyer will purchase a six-cylinder car if he desires a horse power of forty or over, or pays more than \$2,750. The six-cylinder car has so thoroughly demonstrated its great superiority over the high-powered Four that the latter type of car is being built by fewer manufacturers each succeeding year.

Six cylinders are absolutely necessary if you are to derive the maximum amount of pleasure in motoring.

It is obvious, however, that but few manufacturers are experienced builders of Sixes, inasmuch as the majority of manufacturers held back until they were forced to build Sixes. The Stevens-Duryea Company were the six-cylinder pioneers in America. The design of the Stevens-Duryea Big Six, which scored an instant and unqualified success, was being worked out a year before the first car was built in 1905. Hundreds of Stevens-Duryea Sixes were in use and giving satisfaction when manufacturers generally were starting to build Sixes.

The famous Stevens-Duryea Unit Power Plant and Three Point Support insure perfect alignment always, lighter weight and extreme simplicity and durability. Its six cylinders mean perfect control, quiet running and absence of vibration.

Don't purchase an experiment simply because it is a Six-cylinder car. Select a car that is a known quantity. Stevens-Duryea Sixes have been a known quantity since 1905.

The Car You Can Afford to Buy and Keep

is the Mitchell.

—Because it is moderate in price (\$1000 to \$2800).

—Just as stylish, handsome and well finished as any car.

—And is perfect in each detail of construction.

—Doing just as well on the road and standing up to wear and tear just as well as the extravagantly high-priced cars.

Know this for yourself, Mr. Business Man.

Get demonstrations of the high-priced cars.

Then form your opinion in a demonstration of the Mitchell.

The Mitchell agent will be glad to take you out for 50 or 100 miles any day.

Call him up—you are placed under no obligation.

\$2000

Just say "Show me"

He'll answer with the car—show you a "silent argument" that will convince you.

Write for letters proving that the Mitchell is the most economical car to operate, and for catalog No. 18, picturing and describing the Mitchell Touring Car, \$2000, Limousine, \$2800, Roadster \$1250 and Runabout \$1000.

Touring Car shown here—5 passenger, 35 h.p., 4-cylinder, speed 50 miles, finished in Mitchell blue—a very neat and extremely desirable car from radiator to tail light.

Mitchell Motor Car Co., 303 Mitchell St., Racine, Wis.

ENGLISH Speed Indicators

"Smith" Speed Indicators are worth the slightly higher price because they are

More Accurate and Sensitive

at all speeds on account of the hand workmanship and the three-spring governor.

More Reliable

because of the slow revolution of the driving shaft and the use of friction drive instead of exposed cogs.

More Convenient

because they are made both singly and in many combinations (see Type 5 above), with eight-day clocks, communicators, compasses, barometers, etc.

Catalogue on request. Dealers wanted.

212 Miles on a Pocket Battery

Elmore 1908
Valveless 2-Cycle

More conclusive proof of the superiority of the Elmore two-cycle engine over any four-cycle type is impossible of even imagination than the recent test during which the Elmore Forty ran 212½ miles on six small pocket flash lamp batteries.

The very remarkable feature of this test is that when the machine was stopped (for the engine was still running and seemed good for many more miles when the test was abruptly ended to enable the showing of the batteries at the Chicago Show) these miniature cells registered only 2-10 of an ampere of current.

When it is remembered that the average four-cycle motor demands about four amperes of current to supply ignition it will be realized how truly marvelous is this performance.

It shows:

1. That the gas mixture in the Elmore two-cycle engine is scientifically correct.
2. That the ignition system which can run a car 212½ miles with so little current is as near perfection as the two-cycle principle itself.

Further and detailed explanation of this remarkable work will be furnished gladly if you will communicate with the nearest Elmore agent or write the factory direct.

THOMAS

The E. R. Thomas Motor Company Presents Four Styles of Chassis and Nineteen Styles of Bodies

THOMAS 4-20 TOWN CAR. Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, \$3,000 to \$3,250.

THOMAS 4-40 DETROIT. A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse, at a much lower price, shaft-driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, \$2,750 to \$3,750.

THOMAS 4-60 FLYER. The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, touring, landaulet and limousine bodies. Prices, \$4,500 to \$5,700.

THOMAS 6-70 SPECIAL. This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining, as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, \$6,000 to \$6,900.

Garford

The Garford car bases its claim to attention on the fact that it aims to be orthodox in every essential. We have no "1908 Model." We had no "1907 Model." The present Garford, may be, if you please, our 1909 Model and our 1910 Model. There is not in the whole chassis a single feature that has not been proven correct. There is no freak device to become obsolete after its potentiality as a selling point has been exploded.

The Garford Car may advance with the automobile industry, and when safe, to anticipate that advance, but not to depart from it; but the Company protects its customer by its policy of conservatism, never departing from the type and never changing in essential features except as the "TYPE" itself changes.

It is the Practical Things that Count

In the recent three-day 600-mile Reliability Run of the Chicago Motor Club a

Rambler

stock car with no special preparation or equipment made every control on time without an instant's delay or attention and finished in perfect condition.

A hypertechnical committee deprived us of a perfect score on account of a damaged tail lamp and loosened speedometer bracket, but the fact remains that this car underwent the most severe test ever devised without a seal being broken or the tool bag opened, and was at the finish in the same perfect condition as at the start.

Thus was the Rambler again proven

for 1908 is just as dependable as ever, it looks just as good and it behaves just as well.

These are the big things that count. Then come the little things, and this is where we have made improvements that have materially increased the general efficiency of our 1908 model.

The addition of roller bearings on the auxiliary shaft makes far less noise and more power. The tonneau door has been made two inches wider, and a quadrant has been placed over the steering wheel, giving better control of the throttle and spark levers.

THE INCOMPARABLE WHITE THE CAR FOR SERVICE

Exclusive Features of the White Limousine.

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exigencies of street traffic without any changing of gears, jerky starts, or the embarrassing and sometimes dangerous “stalling” of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

THE MAN WHO DRIVES

The "Maxwell"

knows what it is to experience all the pleasures of motoring without that eternal "gnawing at his bank-roll" as is the case with a high-priced, costly to operate car.

The little overdose of prosperity which resulted in the recent stringency has waked a lot of people to the fact that motor-car money's worth does not go hand-in-hand with fancy horse-power and exaggerated claims.

The "Maxwell" has never been a speed-car or a freak. It has never boasted hyper-horse-power.

It is, and has always been, a utility—a necessity—a family car without a "frill" in its construction.

The records it has established in hill-climbs, economy and endurance tests have never been equalled by any other cars, regardless of price.

24 H.P. Touring Car, \$1,750

Mr. J. D. Maxwell's foresight in designing cars of unflinching efficiency, at prices well within the reach of the average citizen, has been well rewarded, to judge from the universal satisfaction of the 10,000 "Maxwell" owners.

That is why these days are "Maxwell" days. Every motor-car buyer will now get a dollar's worth of motor-car for every dollar he pays, and that is just what the "Maxwell" has always given.

Among the important features which the "Maxwell" was the first to introduce, are the three-point suspension, thermo-siphon cooling and multiple-disc clutch.

That features of such prime importance should have first appeared on cars of such low price—\$825 for the 14 H.P. Tourabout, \$1,450 for the 20 H.P. Touring Car and \$1,750 for the new four-cylinder 24 H.P. Touring Car—is one of the most remarkable incidents of the industry, and is evidence of how far in advance the "Maxwell" line is

THE FACTORY THAT MAKES FRANKLINS

The most perfectly planned and equipped automobile factory in the world.

You ought to know the factory to know the Franklin

You ought to know the hundreds of tests and experiments—physical, chemical and electrical—going on all the time in the Franklin laboratory.

For example: the test of wood frames; the experiments by which we nearly doubled the elastic limit of a steel-drive shaft without increasing its size or weight; and similar experiments.

You ought to know how accurately every material is calculated, chosen and treated; how every detail of construction is adapted to its purpose regardless of cost; how scientific manufacturing gives full effect to scientific design.

You would then understand why Franklins, although the lightest-weight automobiles of their power, are the strongest and safest; and why they get more working-force out of an ounce of gasoline; and do more for their rating and price than any other motor-car.

But if you can't visit the factory, you can see its results at any Franklin dealer's. Write for the catalogue anyway.

Peerless

AN EXCLUSIVE EQUIPAGE

THE perfecting of the motor car is accomplished to a large extent by modification and elimination. The perfected Peerless limousine has been developed through such study covering many years. The aim has been not so much to build the largest number of cars as to build each car of the highest quality, workmanship and finish, calculated to give maximum satisfaction. The lines of the Peerless limousine are stylish and handsome, embodying every requisite for comfort. The utmost care is given to the finishing work on the bodies.

Examine carefully the merits of the Peerless cars before deciding definitely upon your car for the coming season. Write for special limousine book (D) giving a full description of the usefulness of the limousine.

THE AUTOMOBILE

Quaker City's Strenuous Endurance Winter Run Results in a Steam Winner

By G. M. Schell

HAL SHERIDAN AND HIS WINNING STEAMER.

PHILADELPHIA, Jan. 6.—At a meeting Sunday night of the contest committee of the Quaker City Motor Club, held at the Hotel Majestic, the White steamer was declared the winner of the MacDonald and Campbell Cup, emblematic of Class A honors in the club's New Year's run. The three-cornered tie of the White, Studebaker and Peerless was run off Saturday over the 172-mile course, and all came through without a single road penalization. After checking in the machines were taken to the garage of the Keystone Motor Car Company, where, with bodies removed, they were carefully gone over by the technical committee—Messrs. Swain and Sellers. It being impossible to gather the contest committee Saturday night to receive the technical report, Chairman E. C. Johnson issued a call for a meeting last night, when, although no figures were given out, the White was declared winner. It was then unofficially stated that the Peerless would be awarded second place.

It speaks well for the American automobile industry, of which the three clean-score cars are representative, and for the American manhood, of which the thirteen occupants of the cars in Saturday's run-over are likewise representative, that they should have withstood the rigors of road and weather as they did. True, the human end of the combination was so nearly "all in" when the finish was reached at City Hall, shortly after 4 o'clock Saturday afternoon, that some of them had to be helped from their seats; but in the face of such an abnormal elemental outburst human endurance was stretched almost to the breaking point. A piercing

northwester, penetrating even the heaviest furs and wraps, prevailed throughout, while a heavy snowstorm, followed by sleet and rain, persisted in falling.

The cars lined up for the start at the Hotel Majestic according to their numbers—No. 9, Peerless, driven by Bert Maucher, W. C. Middleton, observer (Studebaker), E. C. Johnson, chairman contest committee, S. Stankowitch, Jr., and Charles Labelle, passengers; No. 10, Studebaker, driven by Frank Yerger, Frank Stockbridge, observer (White), W. Wayne Davis, committeeman, and A.

J. King, owner, passengers; No. 17, White, driven by H. K. Sheridan, J. Macauley, observer (Peerless), E. H. Lewis, committeeman, and George H. Smith, White branch manager, passengers. The Peerless was sent away at 7:40, the Studebaker and White following at one-minute intervals.

Apart from the constant fight against the elements, there was little record on the trip, all the bad stretches—even the heart-breakers between Doylestown and Ottsville and between Allentown and Kutztown—being reached with something to spare. The Peerless had an awful close shave of it at Allentown, however. A new tire had to be fitted at Raubsville, and while pulling out to make up lost time a team was discovered, lined up, completely across the road, with the horses calmly drinking from a trough, while the driver was inside a hotel doing likewise from a glass. Maucher brought his car to a stop in time, however, but nearly spilled his passengers in the operation. The driver heard the yells and, coming out on the hotel porch, nonchalantly advised them to go to

FINISH IN FRONT OF QUAKER CITY MOTOR CLUB'S QUARTERS.

O. W. HOFFMAN'S STEARNS.

ROBERT SHIRK'S STODDARD-DAYTON.

TOM BERGER'S OLDSMOBILE.

some warm resort and let the horses finish their drink. It cost another delay of two valuable minutes before they could proceed, and it was only by the taking of the riskiest kind of chances by Maucher that the Peerless reached the Easton control just nine seconds short of a down-and-out penalty.

Fast and Furious Weather Made the Ride Galling.

So bad had the weather become when Allentown was reached that a dozen ladies' veils were bought to protect the faces of the travelers from the stinging sleet. In ten minutes the veils had become saturated with a plaster of snow and sleet and were thrown away, the tonneau passengers crouching behind the front-seaters and constantly wiping the drivers' goggles to give them a chance to see the road.

After reaching Kutztown, where the bad going ended, the heavy strain on the cars ceased, although the slippery roads necessitated careful driving. The endurance test of the passengers, however, became more strenuous, for with the increased speed of the cars came added force to the pellets of sleet. The rests in control, however, enabled all hands to hold out until City Hall was reached, but all were grateful that the finish came when it did, as the driving sleet cut like needles and was numbing to the senses.

Like all affairs of the kind held in this section during the last three years, there promises to be an aftermath. Beginning with the protest of the White contingent, first against the reinstating of the Studebaker to the clean-score class on the ground that

a broken shock absorber is not an accessory, and later against the removal of the Peerless penalty for a free-play transmission on the ground that all Peerless transmissions are so assembled, there have been some rather hasty insinuations flung about, which go to prove the necessity for the adoption of a different method of appointing technical committees in future similar contests. As the A. A. A. is the court of final resort in the settlement of all disputes, say some of the cool-headed ones, why should not that body take this matter in hand at once and prevent all kinds of trouble by appointing a committee of, say, three experts to report on the condition of all cars after such contests, their expenses to be paid by the promoting organization. The suggestion, it is believed, would meet with hearty approval by all interested in the sport.

Detailed Story of the Main Event.

The second annual New Year's endurance run of the Quaker City Motor Club came to its scheduled conclusion at 3:15 o'clock Thursday afternoon, when the finish judges, at the City Hall, pulled down their flags. But it was long after 1 o'clock next morning when the contest and technical committees finished their labors at the Hotel Majestic and announced the triangular tie for Class A honors, involving the White, guided by "Hal" Sheridan; the Studebaker, driven by Frank Yerger; and the Peerless, with "Bert" Maucher up. Three other cars came to the finish minus road penalizations—Tom Berger's Oldsmobile, O. W. Hoffman's Stearns, and Robert Shirk's Stoddard-Dayton,

A PACKARD NON-CONTESTANT

OF COURSE THERE WAS A FORD.

AND ALSO A FRANKLIN.

but when President Swain and the other technical committeemen gave them a critical overlooking the unlucky trio fell down and were variously penalized. C. J. Trumbull's Packard won the Class B cup for roadsters, the Maxwell the Class C trophy, and Dan Webster was voted the "most popular driver" cup in Class D, with a Frayer-Miller.

In Class A the Studebaker and Peerless no-penalty cars should, in the opinion of some experts, have also suffered penalization, the former by reason of its broken shock absorber and the Peerless on account of too much play in the transmission. But the officials ruled that a shock absorber was not a part of the Studebaker's regular equipment, and accepted evidence to show that it was the Peerless policy to send out its cars from the factory with transmissions permitting of some play. In the latter case a 10-point penalty had been inflicted on the Peerless, and so announced, but the long and hard kick that followed had its effect, the penalty was lifted and the Peerless

HAL SHERIDAN AND HIS WHITE TRAVELER EN ROUTE PASSING ONE OF THE OFFICIAL CARS.

run with a rear wheel out of true, and declares he called attention to it before the start. Nevertheless, when the eagle-eyed technical committeemen saw the slight wobble they promptly plastered 5 demerits on the Oldsmobile. The Stearns penalty resulted from a cracked front spring and caused 9 points penalty. A car not sufficiently tuned up crushed the Stoddard-Dayton contingent's

hopes of first place. Just from the factory, several nuts worked half a turn loose, and before the committeemen had finished their work with the spanner the car had accumulated 45 bad marks.

Hard luck stories came also from the Matheson camp, whose two cars made really excellent showings—Anderson's having but one point road penalty and Dietrich's but three—and both afterwards went through the technical committee gauntlet without the semblance of a demerit being chalked up against them.

A momentary stoppage of the engine due to dirty gasoline accounted for the Lozier's two road demerits.

Frank Lefem's Garford, No. 26,

was one of the few who survived the first day's run with a clean score sheet. The car would probably have repeated on the second day but for a collision with a cart, which was not only responsible for 15 bad marks on the road, but for 50 points penalty for a bent axle, crooked mudguards and a few other trifling defects resulting therefrom.

PEERLESS TIE PERFORMER ROUNDING MONUMENT AT ALLENTOWN ON SECOND DAY.

was let into the ranks of the elect. The contest committee further decided that the three clean-score cars should cover the route Saturday under the same conditions, in order to determine the winner of the MacDonald and Campbell cup.

When the announcement concerning the Studebaker and the Peerless reached the White contingent they immediately filed a protest and put in a claim for the cup on the ground that theirs was the only car in the run that had covered the course without road penalizations and had been found flawless at the finish. They argued that shock absorbers were auxiliary springs, and had been so declared when a similar question arose in the Glidden tour and the recent Chicago endurance run.

There were other whispers of dissatisfaction with the rulings of the technical committee, especially from the Motor Shop people, both of whose cars, the Stearns and the Oldsmobile, finished with clean scores on the road, only to be penalized. Berger started on the

STUDEBAKER TIE CANDIDATE FOLLOWING THE CONFETTI CAR ON THE SECOND DAY.

THE MAXWELL, WHICH PROVED A STURDY COMPETITOR.

J. W. Florida's Locomobile, despite its 109 road demerits, due to tire troubles, technically came through unscathed.

The battle for Class B honors resolved itself into a duel between Trumbull's Packard and the big Thomas, driven by E. T. Youse. The latter, unfortunately, suffered two punctures just before reaching the night control on the first day.

Another creditable performance in Class B—really one of the best, in fact—was that of A. A. Jones' Ford runabout, which went out of its class and came through with a total of but 20 points penalty, all on the road.

Despite a penalization of 51 points, the little Maxwell runabout won the Class C cup over four contestants.

Only One Accident on the Run.

The bad Doylestown-Ottsville stretch was responsible for the only accident to a contestant. Hugh Coyle, a mechanic in the Columbia car, was catapulted from his seat when the machine struck an unexpected "thank-you-marm." He hit the ground with his face and despite several bad cuts continued on to Allentown, where he received medical attention.

Some idea of the road conditions on that fatal second lap on the first day's run may be had from the fact that but a dozen of the 39 starters in Classes A and B came through it unscathed. The twenty-miles-an-hour maximum—for anything in excess of which the State will not stand, and upon which the contest committee based its schedule—was almost too much for even the big fellows. Deep frozen ruts and sharp-edged stones embedded in the hard mud as firmly as in cement were the determining factors, and there was little danger that the speed limit would be exceeded under such conditions.

Tire damages were so numerous along the Ottville-Doylestown stretch that it seemed almost as if every other car was either stalled for repairs or limping along, hoping to reach the Red Hill Hotel at Ottsville and make repairs after passing through the control.

Some portions of the first leg of the second day's journey was a replica of the Doylestown-Ottsville road, with the ruts, if anything, a trifle deeper. But there were smooth spots where time could be made up and stalled cars passed, and the 57 minutes allowed to cover the 18.2 miles meant very close sailing. Beyond Kutztown, all the way to Reading, the going was excellent. And from the Berks capital over the hard old Philadelphia pike it was child's play for all the cars.

The official schedule followed by the contestants is appended:

FIRST DAY.				
Control.	Miles.	Total Dis.	Time	Total Time.
To Doylestown	26.7	26.7	1:16:00	1:16:00
Ottsville	11.8	38.5	0:38:00	1:54:00
Easton	18.5	57.0	0:54:00	2:48:00
Allentown	21.9	78.9	1:06:00	3:54:00

SECOND DAY.				
Control.	Miles.	Total Dis.	Time	Total Time.
To Kutztown	18.2	18.2	0:57:00	0:57:00
Reading	16.5	34.7	0:48:00	1:45:00
Pottstown	16.6	51.3	0:51:00	2:36:00
Norristown	19.4	70.7	0:57:00	3:33:00
Philadelphia	23.0	93.7	1:21:00	4:54:00

The Tables That Tell the Story.

In the following table are shown the penalties inflicted on the various cars on both days. So disgusted were some of the drivers that they failed to turn in their cards on time the first day. In their cases penalties are shown in second day's column:

A. C. A. INAUGURATES DYNAMOMETER TESTS

EVER since the automobile got beyond the rudimentary stage there has been a demand for a testing instrument that would not alone reveal its power output accurately, but also its speed, grade-climbing ability, frictional loss in the various steps of the transmission of the power and other essentials of similar importance. To a certain extent, practically every man-

W. K. VANDERBILT, JR.'S 90-HORSEPOWER RACER BEING TESTED.

ufacturer of automobiles in the country has invested in apparatus to ascertain as accurately as possible one or more of these factors, but in general the knowledge sought by such testing has been confined to the power output of the motor alone. In some instances, investigations have been carried further than this, as in the case of the testing plant installed by Purdue University, but it has remained for the Automobile Club of America to make by far the most important advance in this direction. The members of this organization recognized the value of such data at an early day, and in 1904 Dr. Schuyler S. Wheeler, first vice-president of the club, and one of the best known electrical engineers in the country, was formally commissioned by the club to evolve a machine which would make it possible to accurately determine the before-mentioned factors in the ability of a car.

On Monday afternoon last there was exhibited on the top floor of the spacious new clubhouse in Fifty-fourth street the concrete result of the three years' study and labor that Dr. Wheeler has devoted to the matter. It is termed a dynamometer, but the ordinary acceptance of that term falls far short of conveying an adequate idea of the completeness of the apparatus which it includes. A dynamometer is merely a power-measuring instrument, the use of which supplies certain data from which the power output of the machine tested can be calculated. In this case it is the most complete assemblage of power-absorbing and measuring instruments that has ever been built for a similar purpose, and the outlay involved in its construction and installation—something like \$10,000—would naturally place such an equipment beyond the reach of the individual manufacturer. The matters of power measurement, integration and automatic recording of the final results have been carried much further than has ever before been attempted. It is no longer necessary to calculate the results from the data thus obtained, for the speed, tractive effort and horsepower may be read at a glance on the large chart.

The equipment consists, in the first place, of a pair of large drums carried on a shaft supported on ball bearings and placed beneath the floor in such a position that the upper part of the periphery of the drums just projects through the floor above, in

such a manner that the rear or front wheels of a car may be run upon them and held there. At the left-hand of this shaft, as shown in the illustration entitled "View Beneath the Floor," will be seen a huge pendulum. When the car is run upon the drums it is held in that position by block and tackle, as will be apparent from the first illustration showing W. K. Vanderbilt, Jr.'s, 90-horsepower Mercedes racing car on the testing stand. As the entire power of the car that is delivered at the rear wheels is transmitted directly to the drums, the pull on the latter causes the pendulum to swing from the vertical, a distance exactly proportional to the effort exerted by the car. A continuation of the pendulum is carried through to the floor above, where it forms an indicating pointer for the instrument, showing the tractive effort in pounds, this being very clearly shown in the third illustration depicting the relative positions of the pendulum and car while the latter is undergoing a test. At the extreme left-hand of the shaft supporting the drum and just beyond the pendulum in the view of the apparatus beneath the floor will be seen two small cylinders and pistons. These play the part of a dash-pot to prevent the pendulum from oscillating as the power delivered by the car varies, one keeping it steady while the pendulum swings in one direction, as represented by the forward speed of the car, and the other when running backward, this also explaining the duplication of the scale of the instrument showing the tractive effort.

Just to the right of the pendulum is the hydraulic brake which absorbs the power delivered by the car, while at the opposite end of the shaft is a large electric motor which is used to turn the drums in order that the car may be run from them, to determine the amount of friction and the consequent power loss in the various steps of the transmission, for verifying speedometer readings by comparing them with the record of the instrument and similar purposes, the front wheels of the car being placed on the drums in the latter instance. It also permits of testing the brakes and measuring the amount of power they absorb when fully applied with the car running at different speeds. This completes a description of the most important essentials of the equipment located beneath the testing floor and on which only the recording and controlling instruments are placed. In the order in which they appear at the left-hand of the testing room, as shown in the large illustration, these are the traction indica-

VIEW OF THE ESSENTIALS LOCATED BENEATH THE TESTING FLOOR.

tor, the speed indicator, the switchboard, the motor generator, the grade indicator and the large chart at the rear, which sets forth the concrete results in such form that they may be read at a glance. The working of the traction indicator has already been explained, its reading being the direct result of the movement of the pendulum beneath the floor.

MECHANICAL PLANT AND CHART OF THE AUTOMOBILE CLUB OF AMERICA'S DYNAMOMETER—THE MOST COMPLETE SET OF AUTOMOBILE-TESTING APPARATUS EXTANT.

The speed indicator shown before it is an extremely delicate and accurate electrical instrument devised by Dr. Wheeler which would require a chapter of some length to do justice to it. In brief, it consists of a conical drum of considerable length, which is revolved continuously at a speed of 200 r.p.m., this speed being verified by a bell which rings automatically every thirty seconds, or 100 revolutions of the shaft, so that the method of measurement is based upon an instrument running at a constant speed like a clock, and which can be easily verified at any time, thus maintaining its accuracy. Against this conical drum there is pressed a light bronze wheel or roller, splined on a shaft which is directly driven by the automobile and adapted to be slid back and forth on this shaft by a small independent electric motor, according to the varying speed of the car until it comes to a rest at a point where the speeds of the cone and wheel agree, this representing the speed at which the car is then traveling.

In conducting the first public tests, which were held on Monday afternoon last before an interested gathering, the club's 30-horsepower car was placed on the drums. It showed a maximum speed of 15 miles an hour on the first speed, the drawbar pull being 510 pounds and the effort developed at the rims of the rear wheels 20 horsepower. This gives a ratio of pull to weight of 20 per cent., which is also the equivalent grade per cent. On second speed the car reached 25 miles an hour, with a drawbar pull of 340 pounds, and showed 22 horsepower at the wheels, while on the third, or direct drive, it ran at 36 miles an hour, with a pull of 270 pounds, and registered 25 horsepower at the drivers, thus giving a combined efficiency for the motor and transmission of 83.4 per cent., based on the car's rating of 30 horsepower, which is a most excellent showing indeed. On the coasting test the power absorbed reached 280 amperes at 100 volts, or the equivalent of slightly in excess of 38 horsepower, while on the speedometer test, the instrument used being a Hofecker, both agreed at ten miles an hour, but the latter fell behind the reading of the instruments at the higher speeds, one mile at 20 miles an hour, 1 1-2 miles at 30 miles and 2 miles at 40 miles an hour.

HOW THE CAR'S PULL IS MADE TO ACT ON THE PENDULUM.

W. K. Vanderbilt's 90-horsepower Mercedes racing car was then placed under test, but it was found that its drawbar pull was so high on the first speed that the hydraulic brake did not get sufficient water pressure to absorb all the power the motor developed. At present the only pressure is from a roof tank, but a special pump is being installed to overcome this difficulty. However, it reached a pull of 880 pounds at this speed, at 21 miles an hour, showing 50 horsepower at the wheels. It was then tried on the direct drive and reached a speed of 74 miles an hour, at which the din in the room was terrific. An anomalous result of this test was that at this high speed the reading of power delivered at the driving wheels was only 30.

Among those present at the tests were Colgate Hoyt, president of the A. C. A.; David H. Morris, and Albert R. Shattuck, former presidents of the club, and Robert Lee Morrell, Dr. Schuyler S. Wheeler, Commodore Frederick G. Bourne, and Secretary Samuel S. Butler.

ALPINE EXPERIMENTS BY NEW YORK-PARIS TOURISTS

PARIS, Jan. 1.—De Dion, Werner, and Benz splashed down the muddy suburban road, bound southward, with a wash of water from the front wheels which would have honored a torpedo boat destroyer. Collignon, who had charge of the procession, muttered that it was nothing, though a stream of liquid would persist in trickling down the spine, despite rubber shirts and storm helmets. But a man who had done Pekin-Paris had a reputation to uphold and could not be expected to grumble at a deluge. Benz and Werner looked as if they enjoyed it.

Two days later, after a non-stop run of 220 miles in non-stop rain, the New York-Paris trio had reached Avallon, and the next morning were at Briançon, in sixteen inches of snow, with a stinging cold, 14 degrees below zero. It is a soft, cottony snow that swallowed up the cars to their axles, not the kind we shall meet in Siberia, declares Lelouvier, for there it is hard, firm almost as macadam.

At night, when we were ready to smuggle under the immense eiderdown on the high-clearance wooden bedstead in a chilly upper room of the hotel, the round-the-world trio were bundled out into the open air to judge the effect of the non-freezing solution which Eugène Boujé had supplied.

Everybody was too excited to bother about breakfast, and at 5 o'clock Collignon and his mates were around the cars wrenching off the radiator caps to see if the water was frozen. It was all right—as clear and liquid as if just drawn from a mountain spring—and a jump was made for the cranking handle. But this was a more difficult matter. For quarter of an hour the De Dion was wound up, with no other response than a hollow

suc-suc-suc. Another quarter with the same result, then another, only to warm the men but leave the motor as cold as a statue. Then everybody wanted to know why the air inlet had not been fitted with a warmer for a car that had to knock about six thousand feet above the level of the sea. A little external heat judiciously applied produced a responsive roar of a hearty, healthy tone.

Then, for the first time in the history of the world, three automobiles climbed around the face of Mount Geneva in winter, traveling over tracks which had up to then been sacred to the sleigh. On the frozen grades, where the car seemed to stand on end, the anti-skid wheels flew around merrily, tearing the rubber surface to shreds. Smooth tires would certainly have been better, but, best of all, would be steel-spiked rims. After every imaginable stunt on frozen snow and impossible grades, a snow bath was ordered for the Benz, and in a second the big car had plunged into a glittering, downy mass that enveloped to the top of the frame. But the 40 horsepower under the bonnet continued to hum their monotonous tune and half an hour later it was proved that a wicker platform under the car would prevent it sinking in any depth of soft snow, and that half a dozen willing hands working in unison with a healthy motor would soon allow one to back out to terra firma.

Next week Werner will be down again to experiment with a kind of sleigh runner on the front wheels and to make further trials of the equipment as suggested by these experiments in the snow. One thing, however, is certain, we have nothing to fear from deep snow or the severest cold.

MAN, HORSE, AUTOMOBILE, AND THE HIGHWAYS

FROM the Lima Automobile Club, of Lima, O., there has come a little book on the outer cover of which is the title: "The Man, the Horse, the Automobile, and the Highways"; inside the designation is "The Highways and Road Etiquette." The club states: "This little book is sympathetically dedicated to the 'old hoss' which finds the 'old pike' a hard road to travel." There is so much common sense and timely advice to automobilists that, in view of the title-page announcement of "Copyrighted by Everybody—No Rights Reserved," the text matter is herewith reproduced with thanks to the enterprising Ohio club:

The Lima Automobile Club herewith sends greetings of good fellowship to every owner of a horse in Allen County, and during these long winter evenings we wish to sit down with you at your own comfortable firesides and chat over some of the things which are of mutual interest to the Horse, the Automobile and the Walker. There is no politics about this, but it is full of good, practical religion, for it has to do with the prosperity, comfort, safety and happiness of everybody in the county, and to facilitate this friendly intercourse let us lay aside all prejudice and be frank and honest to each other, and see if we cannot establish good, neighborly relations between the users of the horse and the automobile, based on the golden principle that each has the same "free and equal rights" on the public highways which we all have had a hand in developing from the forest trail to the perfect pike.

The "perfect pike" is yet to come, but its coming is assured and cannot much longer be delayed. As long as we were compelled to go on foot or on horse-back, we did not complain of the trail. It was all we needed then. The "earliest settler" (our fathers and grandfathers) was too busy with his ax and grub-hoe in preparing a spot of ground on which to raise a few potatoes and a little corn for his wife and babies, to spend his time on the road; therefore it made little difference to him whether it was good or bad—or no road at all. But lo! the change! By and by he had a little surplus corn or wheat. He must sell it—must haul it away to some market where he could get a little cash. This necessitated WAGONS. Wagons necessitated ROADS! So by little they were commenced. Trees were cut; soft spots were covered with poles and split logs. This gave the "corduroy," that served the purpose for the time being. But crops increased, better roads were found to be necessary in order to get the products of the farm to market. All night out on the road—stuck in the mud—half of the time—would not do the thrifty farmers. They must have roads that were more passable. So they bridged and drained and dug and scraped year after year as they could spare the time from their farm work, improving the worst places as fast as possible with the facilities then at hand; but the desire and necessity for better roads grew faster than the roads could be built. But great things were accomplished, and in due course of time a good system of dirt roads was established throughout the country. Then came the desire for more of the comforts, and some of the pleasures of life! The "Old Studebaker Wagon," which had so well served the triple purpose of a pleasure (?) vehicle, a market wagon and a manure cart, would no longer do to carry the wife and daughters to church on Sunday. So the covered surrey made its appearance; and later, with increased prosperity the "boys" must have their "top buggy" and trotting-bred horse for their own private use after a week's hard work behind the plow.

Then the very plows themselves began to go on wheels—wheels for everything!

The First Automobile.

One improvement after another followed in rapid succession. The mower came. Then the horse-drawn and horse-propelled threshing machine came along, asking for a more solid roadbed. Then, as if by magic, there appeared what we now know was a veritable and monstrous AUTOMOBILE threshing machine! It grew and grew, bigger and bigger each year, until it evolved into the enormous Traction Engine of to-day, which goes up and down over the face of the earth, pulling a "train of trailers" which fills the highways full of wheels from one fence to the other, and with noise and steam enough to scare the shoes off a horse less than forty years old. But, nevertheless, all this means real progress, and must not be stopped! It belongs to the spirit of the times! The wheels of progress should never be blocked, whether shod with rubber or rough-shod with ribs of steel. Progress must have a fair field and no favors.

Now to go back a little. The muddy, narrow, slippery dirt roads became obsolete in a day, as it were, and the great cry went up from every quarter: "Give us pikes—pikes! Give us more pikes!

Twenty years of incessant work on pikes has accomplished wonders. It is estimated that in Allen County alone there have already been built over 1,000 miles of pike roads. Think how many loads of stone that means—millions, perhaps. Then count the wear and tear on wagons, horses and men, and count the cost in dollars if you can. It is incalculable; but has all been done without a murmur. Of course, we still need more pikes, but the most important question which confronts us to-day is not so much that of building new pikes as the care and maintenance of those already in existence! During the busy days of new work, the old roads were scarcely given a thought, and many of them are now in sad need of attention. It is poor economy to allow a road to become entirely worn out, and have to practically rebuild it. The "stitch in time" doctrine is equally applicable to a turnpike or a pair of socks. For a short time a new road (as roads have been built in the past) will improve by use; but if not cared for a little each year it will soon begin to go backwards. The great aim in the past has been to see how many miles of new pike could be added each year—the old ones still serving to keep us out of the mud, the purpose for which they were originally built—so why complain?

Rural Delivery Demands Better Roads.

But the large crops and high price of all farm products for the past few years, together with the general prosperity of the whole country, tend to increase the desire for the good things of this world, and affords more leisure to enjoy what we have. The increased number of people who ride over the country for either pleasure or business, to say nothing of the driving required by the great system of rural delivery which has so recently been inaugurated, have created a pressing demand from one end of the country to the other for a better grade of highways than have heretofore been dreamed of. Some roads will be built by the national government and others by the States, but the counties will always be the greatest promoters and builders of good roads.

Some States are already spending millions on their highways. Massachusetts appropriated \$25,000,000 a few years ago for that purpose and now has many miles of beautiful roads as smooth as asphalt pavement. All Europe abounds in fine roads; but they have been at it for centuries and have learned the art to perfection. It may take generations to put all our roads in as good condition as they are abroad, but we have made the beginning, and each year will doubtless show much progress as a whole. Even California is farther advanced in road building than we are in Ohio.

Here is what Geo. W. Lattimer, Chairman of the Joint Good Roads Committee of the Ohio State Board of Commerce and the Ohio State Grange, has to say on the subject of good roads in his recent report:

"The farther one studies and investigates this subject, the more he is convinced that it is one of the greatest problems of the United States. It touches the welfare and interest of more individuals than any other one question that is before the American public to-day. There is not a man, woman or child, in the country or city, that is not obliged to use the roads.

"Owing to the extremely bad roads of the present time, the farmer, who is the producer, is obliged to haul his product to the nearest market at such time during the year as the roads are passable. This occurs within two or three months in the fall, after harvest. This glut and over-supply makes the very lowest prices of the year for the producer, and the consumer in the cities and centers of population is obliged to pay the very highest prices during the months of the bad weather. Good roads will eliminate such conditions so that the farmer can haul his product to the market at any time during the year, whenever the demand calls for it, and the consumer can buy whenever the goods are wanted. Thus the producer will be able to secure a better price for his product and the consumer pays lower prices for his necessities.

"For years the United States and State governments have been appropriating money for waterways, steam railroads and other means of communication, all of which are good, but these questions become insignificant of what good roads will bring to the inhabitants of this country. Everybody should be interested in this question, and should urge Federal, State and county aid for improvements which at this time are all vital to the welfare of our country."

The subject is being agitated everywhere. It is in the very air we breathe, and, of course, good old Allen County is not going to be the least nor the last! We have abundance of good material. Granite, only, is superior to our native limestone for roadbeds or surface dressing. But we require a little more scientific skill in getting the best results from the material we have. It is a little crude in these latter days, to pile down a load of broken stone,

leaving them practically as they were dumped from the wagon, and expect to have even a passable road under a year or two—and all of it at the expense of worn-out tires and jaded horse flesh. And for all this wear and tear you have at best only three deep furrows to show for it—two where the wheels have run, and a sort of a "tow path" where the horses have been. We certainly have become too civilized to continue such a barbarous method of constructing a road. It was the best that could be done at one time; but now we have steam machinery especially adapted for the purpose, which leaves a new road in proper condition to receive a load of corn or a light top buggy.

Now, while the Lima Automobile Club is deeply interested in the general subject of new road construction, and is doing everything possible to promote such work throughout the State, we feel like repeating that the most vital question at this time is that of properly caring for the roads which are already built.

The most deadly enemy to good roads is water! Try and keep in mind this one fundamental thought, that water does more damage to roads than all other agencies put together! If it were not for water a road once good would always be good. Think about this every time you drive over a road speak about it to everybody you meet. Keep insisting that more attention be given to the subject of keeping water from standing in puddles along the road. It stands in pools only when there are holes for it to go into. No holes, no water! No water, no mud! One shovelful of gravel will fill a small hole, and if all the small holes are kept filled, there will never be any large holes!

The Care of Pikes and How "Chuck-holes" Are Made.

You can fill a thousand small holes for what it will cost to fill ten large holes. In one case you will have a perfect road all the time. In the other case you never had a good one. It is either holes or fresh stone the year round! But after a road has been properly built it is an easy matter to keep it so by watching for the small depressions which always appear in a new road, where little pools of water will accumulate after a rain. They look so very innocent and harmless at first; but the enemy—water—is there and at work! It softens the ground, and along comes a loaded team and forces out the water and some dirt with it—just a little—but the depression is made a little deeper and will hold a little more water than before; and the big wagon comes along again and "swishes" out more dirt with the water than it did the first time, and by continuing the process times enough a first-class "chuck-hole" is soon developed, which we begin to avoid by turning to one side. We keep edging away from it—one wagon after another—until we find ourselves in the ditch, where a second hole is created, and then there is no escape, and we must pull our load through some way. We mutter a little and then "lam-up" the horses, which must "grunt and take it," while they are nearly jerked off their feet by the pole and neck yoke.

This kind of thing is repeated many times over, in a greater or less degree during a day's drive over a pike three or four years old which has received no attention during that time. Wherever a drain-tile has been laid across a road you will always find a raise or a hole, even though it has been in for two or three years. Everybody sees it and takes the "jolt," but nobody fixes it, although it might be done in ten minutes, simply because it is nobody's business.

For the same reason when you approach a bridge you are compelled to pull your load up a six or eight-inch raise where the earth and plank come together, and then you must "jump off" at the other end of the bridge, and practically the same thing is also encountered at the numerous culvert crossings wherever you go. Because they have never been otherwise—always just exactly as you see them now—everybody has grown to think them all right, or at least they must be tolerated as something that cannot be changed, never realizing how fearfully abominable they really are!

Horse Sympathy.

The horse is rightfully an object of great sympathy among a large portion of the people who use him to perform different kinds of labor, but not a few are often unavoidably subjected to actual cruelty by their owners because of the un-beastly roads over which they must travel. But, fortunately, with an automobile there is no occasion for compassion. It can be sent regardless over the worst kind of roads without compunction, for a "thing of steel" knows no pain and can endure treatment without injury, which would ruin the animal made of flesh and blood, like ourselves!

Farmers are great spenders of money for every kind of "labor-saving" devices, but "Good Roads" is a better saver than any machine you ever bought. The greater loads that can be hauled, and the saving in wear and tear of horses, wagons and harness, the time saved and the additional comforts obtained are advantages enough to make everybody a "good road" enthusiast, and when once interested in the new order of things, you will think of and talk of little else until you have spread the gospel of good roads

from one end of the country to the other. The whole matter rests with the users of the roads. They get what they demand, and no more. If you protest against letting the old pikes run down, the authorities will certainly inaugurate a better system of maintenance. Certain men should do nothing but look out for and repair the old roads. Of course, it will take some time to put them all in good shape, but finally when they are gotten in order and are watched carefully, the cost in the long run will be far less than by the present system—or lack of system—and a thousand times more satisfactory to everybody.

Road Construction.

A few suggestions about the proper construction of a roadbed may not be amiss.

To begin with, the surface should be made VERY CROWNING, for it immediately begins to FLATTEN by use, and will continue to grow more and more so all the time if nothing is done to prevent it. But it can be held in good shape by occasional scraping. The scraping will also do a great deal towards filling up the small depressions, which are the real beginning of all trouble. But some new material must be carefully put in by hand where needed—not too much, as that will create two holes where before there was but one. Use more brains and less stone! A good road cannot be made without hard thinking. Keep in mind all the time that you are fighting water! You will notice that the roads always remain in the best condition on the grades where the water can easily run away, and you will also observe (after you become interested) that they always grow bad first in the valleys and level places, and that it is because the roadbeds are flat, or perhaps even hollowing with little dams of sod up on the sides so that the water stands there until it soaks in or dries up, instead of running away quickly, as it should, and would if the surface was kept crowning and the furrows kept from forming, which act as canals to conduct the water down into the lowest part of the road, where mud and destruction join hands in their evil work.

Thousands of little culverts may be found covered with loose or broken planks. They are a fearful nuisance and a source of danger all the time. You must bring your horses to a practical standstill before attempting to cross with a load, and if the old family horse is trotting along in a comfortable mood, he must be "jerked up" to a slow walk until you are safely over the danger trap. Along the valleys where the roads are level is the very place where trotting should not be interrupted. That is where the road should be the very best, instead of the very worst, as they always are.

Either iron pipe, tile or stone or concrete arches should be substituted for every wooden-covered culvert in existence, just as fast as possible, allowing the solid earth roadway to continue along unbroken over them, but as they now are they are a menace to safe traveling and a relic of "old corduroy days," and should no longer be tolerated.

We trust no apology is needed to justify the sending forth of this little messenger. Its mission is to promote good fellowship and to draw attention towards the defects in our general road system and to encourage mutual co-operation in working out some means of remedying the trouble. There is nothing whatever deserving of censure or to complain about so far as the past is concerned, but rather everything to call forth the very highest praise possible for what has been accomplished. Our aim now is to try and anticipate some of the needs of the future and to provide for them in accordance with the demands of modern civilization.

Always Something Better Ahead.

There have been many epochs in road-making in this country, each one filling the necessity of the times when in vogue. But nothing is ever final! There is always something better ahead and we are ever trying to grasp it. Old ways are constantly yielding to the alluring promises of the future, and you are continually discarding old agricultural implements and replacing them with the very latest inventions; and still the end is not in sight. Road improvements will be no exception to the law of evolution, and before another decade rolls around there should be no better roads in the world than you will be riding over in Allen County. This is not uttered as a prophecy, but based upon the certainty that you cannot change your natures, and will continue in the future as you have done in the past.

We wish it to be most distinctly and thoroughly understood that there is no intention whatever of trying to convey the impression that there are no good roads in Allen County. That would be both unkind and untrue, for there are many miles that are almost as perfect as they can possibly be. And it is this fact which furnishes the greatest encouragement to push this work forward. If three hundred rods out of a mile are good, it seems only reasonable to suppose that the other sixty-five rods can, and should be, made just as good. Take a mile of perfect road, if you please, and scoop out a few hollows—make a hole or two—put in a culvert,

lay a tile across the road—and see what has happened. It has been transformed into a really bad mile of road, and still nine-tenths of the distance remains just as good as it was before; but, unfortunately, it is disconnected instead of continuous, as it should be for a practical road to travel over.

Good intentions are visible behind every move of the past, but after summing it all up we discover that the trouble rests upon the common fault of neglecting details, which in this case have been eclipsed by the desire to do too much new work.

Now, finally, after having the roads properly built—on paper, at least—let us consider

The Etiquette of the Highways.

A little "frank and honest confession" will be good for us all. Comparatively speaking, the automobile is a new thing on our country roads, and it is not strange that at first there should have been a good deal of opposition to it by the drivers of horses. The man at the wheel was "green," and often had difficulty in managing the thing as he should, and the horses and drivers did not know what in the world to expect, and both sometimes nearly went into fits at the sight of the "red devils," as they were called; but both sides are fast becoming familiar with the thing, and many horses do not see an automobile any more. The time seems at hand when there should be nothing but good-fellowship between the two methods of travel. The question seems to hinge more on individual human nature than any universal desire to make an absolute lump condemnation of both the man and the machine. Courtesy or "cussedness" may come from either side, according to the make-up of the men themselves, regardless of which kind of "animal" they drive. Practically all those who now own machines were horse owners before, and if they are discourteous now they were when they drove the horse. Our nature is not shifted as easily as that. Some men, you know, always have great difficulty in being gentlemen at all times; some never succeed. And we feel like asking the horse men to make a distinction, and concede that a man could be a pretty decent sort of a chap although he does ride in an automobile.

As sure as the wheels of progress continue to revolve, our ranks will be recruited by the tens of thousands from the present owners of horses—and what if you should happen to be one of them? It would not make you bad, would it? Neither has it made any of us worse than we were before we changed (possibly some of us might have always been bad!).

To show how rapidly the automobile is coming into use, statistics show that in 1904 there were sold \$24,000,000 worth; in 1905, \$42,000,000; in 1906, \$60,000,000; and this year, \$80,000,000 worth. This is pretty convincing that they will supplant the horse for pleasure driving, the same as the modern reaper and binder has supplanted the "old cradle of our fathers" for harvesting purposes.

The gasoline engine is becoming a necessity on the farm. Every farmer will soon know how to manage a gasoline engine, and consequently how to manage a simple automobile. Eventually denatured alcohol will take the place of gasoline. The farmer will produce his own fuel; he will carry himself and his family around in his alcohol automobile; he will carry his goods to market or to the railroad station in the same way.

Now, under these circumstances, is it not best that all the information possible in relation to *The Etiquette of the Road* should be in the possession of those who travel? By carefully observing all the rules it will greatly lessen the chance of accidents and make everybody smiling friends as they pass by.

Keep to the Right.

Centuries ago, convenience and custom decided what was the best rule for vehicles to observe in passing each other; and later the custom was enacted into a law declaring that we must "keep to the right," but through thoughtlessness there is a wonderful disregard of this rule by at least one-fourth of the people who drive

horses. They probably all know what the law is, but do not quite realize the great importance of a strict observance of it; although, as a matter of fact, nothing could be more vital. The safety of everyone hangs on never deviating from the rule—not once, even—(except by mutual consent for some good reason). When two horses meet, at a walk, it makes little difference what they do. But with a trotting horse and an automobile it is a very different matter. If both know, absolutely, what the other fellow is going to do, they can pass without danger; but if one driver is undecided as to what he had better do himself, and also entirely ignorant as to what the other one may do, there is likely to be some pretty sharp "dodging" when they come into close quarters—and there may be some swearing after the danger is all over with. This could and should be remedied; and will be as soon as everybody fully understands how very necessary it is that they do nothing else but just turn to the right! Keep saying it over to yourself—"turn to the right." Tell your wife and children about it. Warn them of the danger of doing otherwise, and in a little while it will become a fixed habit for everybody to turn to the right. When an automobile is coming up from behind and wants to pass, the driver will blow his horn in good time to give you warning. And in order that the automobile driver may know—dead sure—that you have heard the horn, you should immediately pull your horse to the right. Then the automobilist understands exactly what you intend to do, and you may feel perfectly secure that he will do you no harm whatever, provided you stick to the right side of the road! It is one of the remarkable, but common things, for the driver of a horse to change his, or her, mind as to which side of the road she (as it is more often women who do it) had better go, and will pull the horse first one way and then the other, and then when the automobilist thinks the matter settled and begins to pass, she suddenly concludes that the other side will be better after all. This is a source of great danger!

Instruct every member of the family on that point. Let them all read this little book. Warn them when leaving home to be sure to keep to the right!

The Lima Automobile Club cautions all their members on this point, and to be very careful when about to meet a horse, and if he is afraid, to either turn out as far as possible or stop his machine and lead the horse past it. We do this many times in a day, for we want to be humane, decent and courteous at all times; and above all, to cultivate your good-will and friendship, for we know that from now on we have to travel the same roads together, whether they be good or bad. We are far more anxious to avoid an accident than you can possibly be. We want to try to undo the prejudice against us, instead of aggravating it.

All automobilists are not members of our club, and perhaps all members do not always do as they should; but you may be sure that we do not sanction anything but true courtesy on the road, any more than you approve of some "piggleh" horseman sticking to the middle of the road and refusing to give an inch—making the automobile take to the ditch while he is deriding us with bad language as we go by. Of course, he is an exception. But we are meeting that kind every little while, and no doubt some of the same kind of men are driving automobiles, but we trust that they also are the exception. That kind of men are devoid of all shame, but both sides must put up with them without lowering our standard of good behavior to each other. As before stated, it is all a question of individual human nature. And neither should be condemned as a class because of what some "bad pill" may happen to do. Always be right ourselves! Keep right, and keep to the right under all circumstances, whether you meet someone or someone wants to pass you from behind—and do it promptly and never change your mind! There is but one thing to remember—RIGHT! Turn to the right—STICK TO THE RIGHT—and you will always BE RIGHT.

Thanking you all for reading this little book, we are,
Fraternally yours,

THE LIMA AUTOMOBILE CLUB.

PENNSYLVANIA FARMERS BECOMING INTERESTED IN ROADS

YORK, Pa., Jan. 6.—That the farmers are also taking an active interest in the good road crusade in this part of Pennsylvania is shown by the announcement that instructors of the State Department of Agriculture will speak on the making of good thoroughfares at the sessions of the Farmers' Institute to be held at Glen Rock, January 15 and 16.

Local autoists have been after the farmers for several years with the hope of encouraging the building of good roads, and they now feel that the latter are finally awakening to the situa-

tion. Many of the troublesome "thank-you-ma'ms" are disappearing from the roads in this section and in the new stretches they are being eliminated entirely.

These farmers' institutes are held in different parts of the county at regular intervals, and it is thought that the good roads question will come in for a great share of discussion and general approval before the sessions come to a close early in the spring. Every encouragement will be given to the farmers by local autoists, and special committees will attend the sessions.

BRITAIN SEEMS TO LEAD IN NUMBER OF CARS USED

SEVEN nations of the world have created an export automobile trade of sufficient importance to justify a place in the financial returns of the government. Ten years ago neither France, America, Germany, England, Italy, Switzerland or Belgium had sufficient trade in automobiles to warrant government returns. In 1898 France, first of all nations, gave separate figures on automobile imports and exports, the latter attaining the moderate sum of \$337,000. Last year the industry had developed to such magnitude that it was sixth in national importance, only being surpassed by such staple industries as silk, wool, cotton and wines. For the first six months of the fiscal year 1907 French exports of automobiles, cycles and tires reached a total of \$19,400,000. It is estimated that for 1906 the exports of automobiles from the seven leading nations totalled \$42,000,000, the entire foreign trade, counting both exports and imports, reaching almost \$100,000,000.

Instructive figures compiled by *Commercial America* show that the United States comes second in volume of exports, the total

period covered by official returns, the value of the cars being quoted at \$10,000,000. Automobile parts reached a value of \$11,628,280, giving a total for complete cars and parts of \$21,628,280 for the eleven months. Calculating the importations of the remaining month at the same rate, this would give about twenty-four million dollars' worth of automobile exportations to England alone, being at the rate of \$60,000 a day. A small percentage of the exports to Great Britain would finally find their way to America and other countries, only being taken into England for re-exportation; these, however, do not figure separately in the official reports. It will be noted that during 1906 France imported for a greater value than any previous year, the total being very little short of 1904 and 1905 combined. More than one-half of these imports came from Germany.

England the Greatest Buyer of Foreign Autos.

So great has been the demand for automobiles in the British Isles that the factories have been unable to keep up the supply.

AUTOMOBILE IMPORTS AND EXPORTS OF SIX LEADING NATIONS.

1906	1,531,000	26,606,000	1,910,000	2,286,000	4,041,000	5,502,000	3,979,000	4,200,000	240,000	1,097,000	12,100,000	2,408,000

*United States statistics are for fiscal years ending June 30th of following years. a United States exports include automobiles and parts

for the fiscal year ending June 30, 1907—the first year in which the value of automobiles is given separately from that of parts—being \$4,890,000. From the chart reproduced from our contemporary, it will be seen that the value of the exports of automobiles from France is greater than that of all other countries combined. Germany follows the United States very closely, Great Britain and Italy being some distance behind and Switzerland and Belgium far in the rear.

Growth of the Industry in France.

A fair idea of the growth in importance of the automobile industry in the six most important countries can be obtained by reference to the accompanying table. It will be seen that France, the largest exporter, has steadily increased from \$337,000 in 1898 to \$26,000,000 in 1906. The latest returns, covering the first nine months of 1907, show automobile exports to the value of \$21,789,200, being an increase of more than five and a half million dollars over the same period of the previous year, compared with roughly \$2,800,000 increase from 1905 to 1906. Although the French increase in exports has been steady, and has maintained approximately the same proportions since 1903, it has not been as rapid during the last two years as that of some other European countries. Six countries imported more than one million dollars' worth of automobiles from France during 1906, as follows:

Great Britain	\$12,100,000
Germany	3,200,000
Belgium	2,900,000
United States	2,400,000
Argentine Republic	1,400,000
Italy	1,200,000

England, the most important customer of France, took 4,615 automobiles during the first eleven months of 1907, the last

The increase in imports of automobiles and parts since 1902 is shown in the following table:

		Cars.	Value.	Parts Value.
Imports..	1902	3,747	\$5,376,000	\$540,000
	1906	5,776	\$12,098,000	\$9,117,000
Exports..	1902	415	\$754,000	\$82,000
	1906	1,380	\$2,413,000	\$1,576,000

In addition to complete cars, Great Britain is also the largest importer of parts, the value of those imported during 1906 being double the value of the previous year. During the first ten months of 1907 the increase of automobile parts was two and a half million dollars more than the same period of 1906, two-thirds of these parts coming from France. Exports increased one and a half million dollars during the first ten months of 1907, two-thirds of the automobiles being sold to British possessions, India, Australia, New Zealand and South Africa taking large quantities. Among foreign countries the United States, Argentina, Italy, and France were the largest buyers.

In Germany the value of the imports of automobiles has steadily gained upon that of exports, until 1906, when they were about equal. During the first nine months of 1907, however, the imports increased and the exports fell back, so that Germany will import more this year than it will export. The valuation of automobiles according to the German tariff is 10 marks per kilogramme for motor carriages and 4 marks per kilogramme for commercial wagons. This is the only nation that makes the distinction between these two classes of vehicles. Three-fourths of German imports came from France. Great Britain stands first in imports from Germany, the value largely being made up of automobile 'buses and other classes of commercial vehicles. In the first nine months of 1907 Germany imported 1,559 auto-

mobiles, valued at \$3,500,000, of which 31 were commercial vehicles. During the same period it exported 995 automobiles, valued at \$2,793,000, of which 221 were commercial vehicles. There has been a falling off of \$400,000 in the value of exports and an increase of \$320,000 in the value of imports over the same period of 1906.

Greatest Recent Increase Made by Italy.

Italy has made greater proportionate advances in the value of automobile exportations during the past two years than any other country, the exports being quadrupled from 1905 to 1906. Around Turin especially, the increase has been tremendous, the Italians claiming equal importance for this district as Suresnes and the neighboring suburbs of Paris, or the city of Detroit. From \$7,000 in 1900, an increase of exports has been made to \$2,286,000 in 1906. Belgium, in 1906, first passed the million-

EXPORT OF AUTOMOBILES FROM SEVEN LEADING NATIONS.

Total value, 1906—\$42,000,000. Value in thousands of dollars. 000's being omitted. The value of exported parts is not included in the chart.

dollar mark in value of exportations, with a promise of further increase. Its imports are small and do not show a tendency to increase.

The Story of a Stupendous Home Growth.

America's story of increase has to be presented on the basis of the national output, on which lines it is as astounding as the export figures presented by France. These are to be found in the various census returns, from which it is seen that there was an increase in the value of products of 461 per cent. between the census years of 1899 and 1904. Regarding 1907, estimates only can be made, but even on a moderate basis they show a progress that is unprecedented for an industry which hardly existed ten years ago. The two census returns and the estimates for 1907 and 1908 show a substantial growth as follows:

American production, 1900\$4,748,000	
" " 1905\$26,645,000	21,692 cars.
" " 1907\$80,000,000	40,000 cars.
" " 1908\$100,000,000	50,000 cars.

In addition to the automobiles of home production there must be added those received from foreign countries, the returns for the years 1901 and 1907 being:

Imports, 1901\$43,129	26 cars.
Imports, 1907\$4,041,000	1,176 cars.
Imports, 1907\$801,000	parts only.

Of the cars received during the past year 841 were from France, 144 from Italy, 104 from Great Britain (these being

largely composed of re-exported cars), 61 from Germany, and 27 from other countries.

It is somewhat difficult to compare the American industry bulk for bulk with that of any other nation, for while the importance of every foreign nation depends on its export trade, and official figures deal only with cars sent abroad, American census returns deal with the industry as a whole. French imports will reach \$27,000,000 in 1907; placing the value of the home consumption at the same figure—a generous estimate—this would give a production value for France of \$54,000,000. Great Britain, according to general estimate, will produce automobiles to the value of \$25,000,000, making a total production of \$79,000,000 for the two most important countries of Europe. Thus the American production for the past year has been, if not greater, at least equal to that of France and Great Britain combined.

Most significant in this story of growth is that the United States has attained a position in the export world second only to that of France, the number of cars sent abroad in 1907 being 2,862, valued at \$4,890,000. In the chart of the exports of automobiles from the United States by countries, the value of the parts is also included. This amounts to \$611,000 for all countries. From this chart it can be seen that Great Britain is the largest purchaser, followed by the British colony of Canada, these two alone taking nearly one-half of all the exports from the United States. Concurrently with the growth of the automobile industry has sprung up a considerable export trade in metal-working machinery, every factory in France, Italy, Germany and England being stocked with American-made machine tools.

In 1900 the leading automobile manufacturing States were Illinois, Massachusetts, New Jersey, New York, Ohio and Pennsylvania. In 1905 Michigan alone made more automobiles than the whole country in 1900; the same was also true of Ohio. There is a strong tendency, too, for the American automobile industry to group itself in large cities, eighty per cent. of the products of the industry being credited to cities of over 20,000 population, 86 establishments out of 121 being in these cities. The leading cities with the value of their output, as given by the census, are as follows:

Detroit\$5,382,000
Cleveland4,256,000
Buffalo1,385,000
New York1,186,000
Indianapolis797,000

England Leads in Number of Autos in Use.

Contrary to general supposition, it is not the United States but Great Britain which leads in the number of automobiles in use. The figures of France, which come fourth in importance, are always conservative, the returns being based on the number of automobiles actually paying tax based on horsepower. Manufacturers' and dealers' stocks are not declared for taxation purposes; cases of double taxation are exceptional, and there must be a number of rarely used machines in repair shops and elsewhere which escape the official returns. French figures thus comprise only those machines in actual daily service. British returns, being based on registration giving no encouragement to false returns, may be taken as perfectly reliable. The American figures are based on estimate, no complete returns for the whole of the States of the Union being available, and even those making returns being not altogether correct, owing to duplicate registration. The returns for the year 1907 in the four most important countries are:

Great Britain119,618
United States80,000
Germany42,980
France31,286

In the figures for Great Britain are included 53,877 motorcycles; Germany's fleet of two-wheelers included in the total amounts to 15,700.

LETTERS INTERESTING AND INSTRUCTIVE

USING A SINGLE COIL ON TWIN ENGINE.

Editor THE AUTOMOBILE:

[1,074.]—We would like to know if we can use a single spark coil—a Splitdorf—on a double-opposed engine to work all O. K.? Give us full instructions as to how to wire same for a four-cycle. Also the proper way to pipe up the water so it will work right through both cylinders at one time for above engine. The coil is a vibrator dash style. A SUBSCRIBER.

Canton, O.

Assuming that you now have an engine wired up to use two vibrating dash coils, the only changes necessary are to carry both wires from the timer to the single coil you propose to use and take two leads from the secondary, or high tension, side of the coil, one to each of the spark plugs. This will cause a spark to occur in both cylinders every time contact is made and as long as one plug does not present any materially greater resistance to the passage of the spark than the other, both should spark without imposing any extra duty on the coil. The battery is connected to the primary, or low tension, side of the coil in the usual manner, the other side being grounded; that is, attached to some part of the motor, or of the car near the motor, while the same is done with one side of the secondary to form the usual ground return in each case. This is the simplest method available, and while it may work satisfactorily for a long time at a stretch, it is not the best method to use. For the latter, the timer at present on the engine should be removed and a distributor substituted. This may be had from any dealer in ignition accessories. It times the low and high tension currents simultaneously and the connections are very simple, the following being the complete wiring: One wire from battery to low tension side of coil, second wire from battery to ground, i. e., on motor or frame; one wire from primary of coil to distributor, second wire from low tension side of coil to low tension side of the distributor, this being plainly marked on the latter, as are also the secondary connections. One wire from secondary side of coil to distributor; one wire from each of contact points of latter to each plug; second wire from high tension side of coil to ground connection.

The piping for the water circulation of the motor should be so arranged that the cold water enters each cylinder at the same temperature and leaves it at the same temperature. That is, instead of running the water into the jacket of one cylinder, and from there into the jacket of the second cylinder and then back to the radiator, it must be piped from the radiator directly into both jackets, and from the latter back again. A single pipe suffices for this in each case, branches being made just at the motor. A three or four-inch section of good rubber hose should form part of both the cold and hot water pipes in order to provide for any relative movement of the radiator and the motor, as otherwise the pipes are apt to be snapped apart by the jolting.

ONE CARBURETER WILL WORK BETTER.

Editor THE AUTOMOBILE:

[1,075.]—We have an eight-cylinder 5 by 5 1-2, four-cycle light auto engine with two 1 1-2-inch carbureters on it. Is there any reason why one carbureter won't work just as well as two?

Haverhill, Mass.

HAVERHILL PASTE CO.

Probably you will find that removing one of the carbureters now on the motor and devolving the entire duty upon the one remaining will give better results than formerly, provided that the carbureter has sufficient capacity and that the manifold be arranged in the proper manner. All the eight-cylinder motors we have ever seen have never been equipped with more than one carbureter.

SIMILAR TROUBLE WITH COPPER TANK.

Editor THE AUTOMOBILE:

[1,076.]—I read with considerable interest question 1,028 with your reply under "Letters Interesting and Instructive" in your December 19 issue, as I had a similar experience with the gasoline tank in my car, with this difference: In my case the scale or flake which formed in the gasoline tank and clogged the outlet and feed pipes was BLACK. The tank in my car is made of copper instead of galvanized iron, but I have been unable to discover the reason for the existence of the scale, as I have been very particular about the quality of the gasoline used and always strain it through a chamolis. A. H. LANDSBERGER.

San Francisco, Cal.

Several replies have already been received from subscribers and some of them published in this department regarding trouble of the nature described by Dr. Tuttle in the letter which opened this line of inquiry. But thus far, without exception, each one of these answers from autoists in different parts of the country has ascribed the cause of the precipitate to the employment of galvanized iron for the tank, and in one case at least it is stated that the substitution of copper for the fuel container proved an entirely satisfactory remedy both in a motor-boat as well as on an automobile. The fact that in the present instance the usual copper tank is employed puts an entirely new aspect on the matter, and with the exception of the indication that the color of the scale or formation points to some chemical combination of a constituent of the fuel with the metal of the tank, we must confess our inability to state just what the reaction between the two is, as well as the nature of its product. However, as numerous engineers, chemists, physicians and other technically skilled men are to be found among the subscribers of THE AUTOMOBILE, we have never failed in the past for lack of responses of the most satisfactory nature to even the most abstruse questions of any nature, and feel confident that an appeal for information in the present instance will prove no exception to the rule. We should be pleased to hear from any autoist who has experienced similar trouble, or who knows its origin, whether he happens to be a subscriber or not, the matter being one of considerable general interest.

REDUCING THE GEAR RATIO OF A CAR.

Editor THE AUTOMOBILE:

[1,077.]—I bought a runabout and want it changed to a touring car with semi-limousine top. I want to find out how I will gear my sprockets down. I have thirty-seven in the rear and twenty-four in the front, which I know is too high for a touring car. I want to gear it down to about 4 to 1. Please let me know the best way to gear this down. I have thirty-six-inch wheels.

Baltimore, Md.

R. B. FIELDS.

In order to be able to reduce the gear ratio of your car to the desired point, it is essential to learn just what it is now, and the data concerning the sprockets alone is not sufficient for this owing to the reduction at the bevel gearing on the countershaft. With the car on a smooth, level floor, turn the engine over until the piston of the first cylinder is about to start downward on a power stroke. Make a mark on the flywheel and on some part of the motor alongside of it so that the revolutions of the flywheel can be counted. Then make similar marks on the tire of the rear wheel where it touches the floor, and on the floor itself directly beneath it. With one man to watch the flywheel and another to keep an eye on the mark of the rear wheel, push the car forward in a straight line, having set the change speed lever at the point corresponding to the high speed or direct drive before starting. A revolution of the engine should be counted every time the marks of the flywheel and motor coincide, and the car should be halted the moment the chalk mark on the tire again comes down to the floor, thus completing one revolu-

tion of the driving wheel. The number of turns the flywheel has made during this time will give the gear ratio of the car. Unless this is found to be higher than 3 to 1, we should hardly advise changing it merely on account of the weight of the touring body. You do not state the power of the car, but as it has 36-inch wheels, we judge it to be of 30 horsepower or over, in which case the extra weight would not affect anything more serious than a slight reduction of the speed. If the present gear ratio be 2.5 to 1, it would be advisable to lower it by using smaller forward sprockets. The present ratio of the sprockets alone is 1.54 to 1, i. e., the forward, or driving, sprocket makes a turn and a half for every turn of the driven sprocket. Either a 20 or an 18-tooth forward sprocket, giving reductions of 1.85 to 1 and 2.05 to 1, should prove satisfactory. Unless the car has but small power for its weight, it would hardly be advisable to gear it as low as 4 to 1.

CONCERNING KEROSENE AS A PREVENTIVE.

Editor THE AUTOMOBILE:

[1,078.]—Will you please publish under "Letters Interesting and Instructive" at what temperature kerosene boils. I tried kerosene in place of water to cool my engine with, but it is not altogether satisfactory. It circulates and the radiator does not get very hot, but the kerosene will smoke and "teem" on about a half hour's run. The other objections are that it is so dirty to handle and gives off a bad odor.

Please give name of some tester or instrument that could be used to tell the density of a calcium chloride solution. What should it read to stand 15 below zero? I am afraid to use a solution of it now, as I do not know where it would freeze at.

Oregon, Ill.

F. R. ZEIGLER.

Kerosene distilled from different grades of petroleum differs more or less, the same as gasoline, but its boiling-point will be found to average between 180 and 190° F., according to its specific gravity. It is far from being a satisfactory substance to use in the cooling system of an automobile, even if it were not burdened with the disadvantages of a low boiling point and an offensive odor. We should think its use would be more or less dangerous, at it becomes highly inflammable when raised to this temperature and also gives off an inflammable and explosive vapor.

A hydrometer is employed to test the density of a solution, and when ordering it the nature of the solutions with which it is to be employed should be stated, as these instruments are made for numerous special purposes. We have no data at hand as to the density of calcium chloride solutions to prevent freezing at stated temperatures, but you can easily ascertain this for yourself without any trouble. The proportion of four pounds of calcium chloride to the gallon of water, gives a solution that will resist freezing down to slightly lower than 15 below zero F. Having prepared this, test it with the hydrometer and mark the latter at the point on the scale to which the instrument sinks in it. If loss from steaming or evaporation is feared, the hydrometer may be dropped into the solution in the radiator from time to time and if it shows that it is becoming heavier by allowing the instrument to float higher, add sufficient fresh water to restore its former specific gravity. The solution should be tested for acidity before being placed in the radiator by dipping a piece of blue litmus paper in it; if the paper turns red, a small amount of slaked lime should be added, until the paper shows no reaction, a fresh piece being used each time. Get the best calcium chloride obtainable, as the crude salts are apt to contain considerable free acid.

IS A NEW CARBURETER THE BEST CURE?

Editor THE AUTOMOBILE:

[1,079.]—I should appreciate your opinion on the following: I am driving a 1907 Maxwell runabout and have been thinking for some time that perhaps I could get better results by installing a "Holley" carbureter. Perhaps the fault lies with me in not being able to get the proper adjustment with the present carbureter.

My motor misfires considerable with the spark advanced and gas all on, batteries and vibrator in good shape. J. A. SPOONER.
North East, Pa.

So many autoists, when they find themselves in a similar predicament, never appear to stop to ask themselves whether the device they are belittling has given satisfactory service prior to that time. It may have covered thousands of miles on the car with little or no trouble, but once the latter does come to afflict them their first thought is replacement of the offending article. We do not know whether this happens to be your case or not, but the practice is quite common and must, in numerous instances, lead to an unnecessary outlay for new accessories. The makers will doubtless be glad to assist you in every way possible, and we should advise consulting them as to the proper manner of adjusting the carbureter before making a replacement.

TO MAKE GASOLINE MORE EXPLOSIVE.

Editor THE AUTOMOBILE:

[1,080.]—Please answer through "Letters Interesting and Instructive" what is it they put in gasoline to make it more explosive, or have more power, and would it be safe to use it in a car? How much to the gallon?
A SUBSCRIBER.

Portsmouth, O.

Picric acid is the material that has been employed on various occasions in racing to increase the power of the motor, and while it is said to accomplish this end successfully, it is not a safe thing to use from more points of view than one. The quantities employed are small, something like two per cent., we believe, although we have no data on the subject; but in addition to the risk of ruining the motor through the production of explosions far more powerful than it was ever designed to stand, it must be borne in mind that picric acid is commonly used for etching steel, and even though present in small quantities, it is apt to have this same deleterious effect on the cylinder, valves and other parts of the motor with which it comes in contact. Oxygen and acetylene gas have also been employed at different times to make a motor more powerful than it would otherwise be on ordinary fuel. Such expedients are never to be recommended for anything but racing, and they have but scant justification for existence even in that field. The autoist who values his motor should let them severely alone.

A STAND FOR "RESTING" THE TIRES.

Editor THE AUTOMOBILE:

[1,081.]—Some two or three years ago at the automobile show in Boston, I saw a certain stand that you could just run the machine on and that would raise it to rest tires, four wheels at one time. Could you please let me know the firm's name, if the concern is still doing business?
PHILIPPE SYLBESTRE.

Woonsocket, R. I.

We believe that the device you have reference to is known as the "Autobed" and that it is still manufactured by a concern of the same name, located in Boston, i. e., the Autobed Company, 36 Columbus avenue, Boston. If this be not the article you have in mind, a further inquiry in these columns would doubtless elicit the desired information from some of our subscribers, many of whom seem to have wonderful memories where such things are concerned.

MACHINING THE COMBUSTION CHAMBER.

Editor THE AUTOMOBILE:

[1,082.]—Why is it that most gasoline motors produce a definite recurrent beat in the sound of their running, which appears to correspond with the number of cylinders the engine has—that is, with a four-cylinder motor, for example, every time four cylinders have fired the beat occurs. I do not know how to describe any better than this what I mean, but am sure that you must have noticed it yourself. I figure that there is no reason theoretically why a single or multi-cylinder motor should not, when running right, produce an even, regular sound of perfect, unchanging rhythm, and a few motors do so, but the generality of them show the marked

pulsation I speak of. If you or any of your readers can explain this, I am sure that I, among others, will appreciate acquiring the information.

Toledo, Ohio.

We all have noted the effect you speak of, now that our attention is called to it, and it is the consensus of opinion in this office that failure to machine the combustion chambers, with consequent variation in compression between the different cylinders, is the cause. It is practically impossible to secure perfect uniformity in castings, so, in motors the compression clearances of which are left as cast, a variation in compression and completeness of exhaust, with consequent variation in power and the intensity of the exhaust noises, is produced. This would readily explain the reason for the "beat," which is simply a perception of a regularly recurrent sound, louder or softer than the rest. If any one else has any other or better theory to suggest, however, we shall be pleased to give space to it.

INFORMATION WANTED ON FOUR-WHEEL DRIVE.

Editor THE AUTOMOBILE:

[1,083.]—Would you be kind enough through the columns of your paper to give me some information regarding four-wheel drive motor wagons, built in Milwaukee, Wis.; why they are using a main differential; I understand when one wheel is skidding or in a hole, then you are practically helpless. What would happen if one of either front or rear wheels got stuck; your power would not be available for either front or rear wheels. If your main differential was not there, it seems to me unnecessary for the low speed obtained with them to employ any differential between the two driving points.

F. S. SANDERS.

St. Paul, Minn.

We are not sufficiently familiar with the design of the truck in question to be in a position to answer your question intelligently. It is our impression that these vehicles are no longer being built for the market, but as quite a number of them were doubtless turned out, there will be in all probability at least several of our readers who can throw some light on the subject covered by your line of inquiry. If so, we will be pleased to hear from them.

GEAR REDUCTION OF THE PACKARD ON HIGH.

Editor THE AUTOMOBILE:

[1,084.]—Will you please answer the following questions in "Letters Interesting and Instructive":

1. What is the gear reduction on Packard "30," 1907?
2. What is the gear reduction on Packard "30," 1908?

Saratoga Spa, N. Y.

CHARLES HESLIN.

The gear reduction of the Packard on the direct drive is 3 to 1, on both the models you mention, as well as on the one that preceded them, namely, the 1906 model.

CONSIDERS ARTICLE RATHER "THEORETICAL."

Editor THE AUTOMOBILE:

[1,085.]—We have read the article on lamps, issue December 12, with some care. In general, we would say someone had written the article who is not connected with the industrial side of the question, and is "theoretical" rather than "practical."

Passing to specific criticism, we note that the use of the electric arc and the Nernst lamp is suggested. The smallest practicable size of the former takes about a fifth of a horsepower, and the latter from about one-seventh of a horsepower upwards, and in both cases there is the generating machinery to be considered. Most of us cannot spare so much power for lighting, and nobody wants the added machinery, so that the future for either of these illuminants for motor car purposes is not promising, except, of course, where a storage battery is the motive power. "Theoretically," we suppose they are all right.

The writer's definition of mean spherical candlepower is incorrect. Mean spherical candlepower is not a total, but an average; and is obtained by measuring the candlepower in a dozen or more directions (theoretically in all directions) and taking the average of the results. The term arose in connection with the measurement of incandescent and arc lights, or at least assumed importance in that connection. With flames such as acetylene, which give practically the same illumination in all directions, the mean spherical candlepower is nearly the same as the candlepower in any one direction. Fig. 1 of the paper means nothing.

The writer's figure of 12 per cent. as the available percentage of light in the arrangement of Fig. 2 is correct, if the box does not reflect any. He is also right in saying that the mirror in Fig. 3 converts into a parallel beam 12 per cent. of the total emitted by the flame. We measure the angle subtended by the mirror in Fig. 4 as 140°, and this makes the percentage falling upon the mirror 34.2°, and not 37° as he finds, but this difference is not material.

Figures 2 to 7 appear to be correctly drawn, but the argument based upon them rests on three assumptions which are by no means admissible without pretty definite proof, a part of which must be drawn from experience. The first assumption is that the law of inverse squares holds under all conditions. He makes this statement in the third paragraph, and it is not true for reflector lamps, except beyond very great distances, several hundred feet or more; perhaps not even then. Inside this limit the law of inverse squares is not applicable, and a photometric measurement of such a lamp against an open light as a standard is absurd.

Incidentally, the calculation of candlepower in the last paragraph is equally absurd. To show this, just draw a sphere in Fig. 7 with twice the radius of the one pictured. The beam D E will cut the larger sphere, and will be of the same size and consequently of the same brightness on it. But if it cuts out one-fiftieth (taking the figure given, which is probably correct) of the smaller sphere it will cut out only one-fourth as much of the larger one, and hence its candlepower would be 25 divided by one-fourth of one-fiftieth, or 5,000. This is a charming way of computing candlepower. You can get anything you please by taking a suitable radius for the sphere. We think you are familiar with our opinion that candlepower of reflector lamps means nothing. All that can be said is that such a lamp at such a distance gives as much light as would be thrown in the given direction by an open lamp of such-and-such candlepower; and as this value will change with every change in the distance, it is of very little use as a basis of comparison.

The second assumption which we think is by no means justified is that light not concentrated into a parallel beam is wasted, a statement the writer makes in so many words. If your lamp throws out a cylinder of light of the diameter of the front glass you will have brilliant illumination along this cylinder, and nowhere else; and if such a lamp could be constructed it would be of no practical use on the road, where the conditions are not those confronting the commanders of war-vessels or locomotives. Hence we take decided exception to the statement that the lamp of Fig. 6 has a net efficiency of only 88 per cent. We think all the light is utilized, and very well. In the case of Fig. 5, our opinion is that only the zone DC (IJ on the other side) is wasted, all the rest being usefully employed so that the efficiency of this lamp would be considerably above 50 per cent. The fact that the source of light is not a point prevents the attainment of perfectly cylindrical beams, and so the advantage of the slight divergence of the beam from the mirror is not seen at its best; but to our thinking the "fan" distribution is an indispensable part of the illumination.

The third assumption to which we take exception is that there is no absorption, either by the reflecting surfaces or by the lens of Fig. 7 or its mounting. He does mention the necessity of keeping the surfaces polished, but he omits to state that unless they are kept in perfect condition his figures are incorrect and the conclusions from them vitiated. A good mirror will reflect 92 to 95 per cent. of the light falling upon it; a poor one may send back anything less, down to almost nothing if the mirror is behind a smoky flame. How close to the mirror a hot flame can be placed without damage to the reflecting surface or deposit on the glass, we know by experience, but from such examples as we have seen on the road we have come to the conclusion that more is lost by imperfectly reflecting mirrors than is gained by a very large cone of intercepted light.

GRAY & DAVIS.

Amesbury, Mass.

"CRY GOOD ROADS FROM EVERY HOUSETOP!"

Editor THE AUTOMOBILE:

[1,086.]—Will you allow an assiduous reader of "The Automobile" to make a comment on that most illuminating article, entitled "Learned in the Process of Evolution," by Charles B. Hayward, in the issue of December 6. Certainly a fairer, more generous article was never written, but may not some of the supposedly constructional vices of the modern automobile be laid at the door of the reckless, unintelligent conductor, and again to bad American roads? You can't escape these things merely by making automobile parts which allow an extraordinary margin of safety. This element may already be said to exist in most modern automobiles. Foreign cars, of which the writer knows something in a general way, French cars in particular, are certainly not—in most instances—ill designed or ill made, and the fact that high-class, well-known French "marques" do occasionally go to pieces on American roads is rather an indictment of those sloughs of despond than the type of car which has been run for tens of thousands of kilometers over

French roads with never so much as a cotter pin shaking loose or a nut having been started from its seat. Even that little Pekin-Paris affair brought out no serious structural faults that could not be well guarded against by an intelligent and painstaking and careful driver, and certainly no other kind ought to be let loose on the highways.

I am told that the bad roads in America necessitate a relatively high horsepower to get over the ground at all, to say nothing of making "la vitesse." This means, then, a relatively high cost product to begin with, and again a costly consumption of gasoline—and shall we not also include pneumatics? Cut it out; go to the roots; cry good roads from every housetop; not only good roads to begin with, but agitate for national support that shall help in the making of them and in their upkeep.

Even France, the most paternal of governments, in all things, is now studying the question as to what kind of good roads are best suited to the new class of traffic which goes over them in automobiles. The Romans and Napoleon did very well, but Republican France promises to do something even better. Shall Republican America remain behind with the buggies? The writer thinks not!

FRANCIS MILTOUN.

Martigues Bouches du Rhone, France.

TAKES ISSUE WITH MR. FAY ON NEEDLE VALVE.

Editor THE AUTOMOBILE:

[1,087.]—I cannot refrain from sending you a line to take issue with Thos. J. Fay on his dictum condemning the adjustable needle valve, in his otherwise admirable article on the carbureter in your issue of December 26, 1907.

I am now driving and taking entire charge of my fifth automobile, and I am free to say that I would refrain from purchasing any car which had a non-adjustable gasoline nozzle. The car which I am now driving, one of the highest powered American cars (30 to 60 horsepower), had a double carbureter in which both nozzles were without the friendly old needle valve; the only possible adjustment being some movable slots for the control of the air. After a few weeks' trial the agents consented very courteously to take this carbureter out altogether, and to substitute for it one in which both nozzles had the familiar needle regulating valve. The change in the general behavior of the motor was magical. I can now keep the motor running to the best advantage under all varying conditions of temperature and humidity; and can do more good with a quarter turn of one of the needle valves than could be accomplished formerly with an hour's tinkering at the air supply. The manufacturer of the car wrote me a polite letter on the subject, saying that he had adopted the non-adjustable gasoline nozzles because he had found a tendency on the part of inexperienced purchasers to get the adjustable type of nozzles out of order.

I think the trusting too much to automatic mechanical action on the part of manufacturers is an error; since often in making a machine "fool-proof" (insulting phrase) the tendency is to produce a machine which, while it will run tolerably well for everybody, will never run just right in the hands of anybody. The average owner of an automobile is an eager student of mechanical principles, and it seems to me that each year he grows fitter to be trusted to make those small daily adjustments, which are necessary if the motor of an automobile is to do itself full justice.

Philadelphia, Pa.

A. S. LOGAN.

SHOULD DRIVERS NOT BE SUBJECT TO TESTS?

Editor THE AUTOMOBILE:

[1,088.]—While attending the recent automobile show in Chicago, I had the misfortune to be in a car when an old street sweeper was knocked down and almost run over. Luckily he was not hurt seriously, although it was necessary to take him home in a carriage. This happening so completely finished my desires for demonstrations, that it was the only ride I took while in Chicago. We were turning slowly around on Michigan avenue to return to the Coliseum, with no power on, when the old fellow suddenly appeared directly in front of us. The boy driving had plenty of time to stop, but did not seem to know how; and that was the awful part of it. He did not know how to stop his car even when only running free and very slowly, and yet he was trusted with the lives and limbs of prospective customers, to say nothing of numerous pedestrians. And he actually confessed that he had never driven an automobile of any sort until the Friday before the show. With one day's experience, he was sent out to steer a car through the crowded avenue. Not to mention the foolhardiness of a firm in using such a boy for that purpose, does it not seem that some means should be used to put a stop to the use of automobiles by any one with so little knowledge of them? I wish I could stir up something or somebody to get some legislation on this subject, but realize that I have not the ability. However, you, through your excellent journal, should be able to at least start the thing, and it is a serious question.

Alliance, O.

ANOTHER EXPLANATION OF THE SCALE.

Editor THE AUTOMOBILE:

[1,089.]—In reading over your "Letters Interesting and Instructive," I was interested in Dr. Edward G. Tuttle's letter, No. 1,028, in which he states that a peculiar formation in his galvanized gasoline tank gave him considerable trouble. Explaining my experience with a galvanized tank in a gasoline launch last summer, I was troubled with a dark black scale which would run down the pipe line and clog up the carbureter. Upon close examination of the tank I found that I could pick off a dark scale where the seam had been soldered, which was probably caused by the uncut muriatic acid which was used for soldering same.

After I had remedied this I still had trouble with my carbureter choking up with a dark substance, but was much different from the tank scale. I afterwards found out by taking out my pipe line, which was ordinary gas pipe, and tapping it with a hammer, that I got as much as an ounce of black iron scale which had formed inside of the pipe after being in use for about three years. I would pronounce this scale a sort of rotted iron.

Hoping that Dr. Tuttle will find the experience useful, I remain,
Springfield, O.

R. D. VERCLER.

DRY CELLS FURNISH SATISFACTORY SERVICE.

Editor THE AUTOMOBILE:

[1,090.]—Regarding query No. 1,052, would say that I became interested in ignition difficulties by Arthur F. Jackson's article on that subject in the May 23, 1907, number of your magazine, and also in that of a paragraph in the "Automobile Instructor," which says that "It is impossible to adjust a coil advantageously to battery consumption and correct ignition by the sound of the vibrator." I accordingly purchased a coil current ammeter and regulated the current of my coil to that of a 3-4-ampere strength, to do which I was obliged to weaken the vibrator springs besides the usual regulation by the screws. After so regulating I ran my car 1,600 miles on five dry cells and with the same spark plugs. I occasionally tested the current with the ammeter, but no regulation was required until the batteries became nearly exhausted, upon which I replaced them with new ones. So far as my experience goes, I can heartily endorse Mr. Jackson's statement that dry cells when used intelligently furnish a most satisfactory ignition. I think his article would be worth reprinting for the benefit of your new subscribers.

H. W.

Worcester, Mass.

HAD TO SUBSTITUTE COPPER FOR THE TANK.

Editor THE AUTOMOBILE:

[1,091.]—Replying to inquiry No. 1,028, regarding the yellow precipitation occurring in galvanized gasoline tanks, I have had the same experience. Some years ago I ran a launch on Long Island Sound and had the same trouble, although the stoppage was not at the mouth of the gasoline outlet. In my case the precipitate entered the carbureter, but the result was the same—the engine stopped. I remedied the difficulty for the time being by putting in a through way between the tank and carbureter and using the attached pipe as a catch-basin. It was only a makeshift, and fearing the corrosion might continue until a hole had been made in the tank, I finally removed the latter and substituted a copper tank.

Several automobile manufacturers use galvanized gasoline tanks, and some time ago I wrote to the Lambert people asking them if they had ever any trouble such as described above, and they replied that they had not. I wonder if the precipitation is due to the salt air, and that away from the sea it would not occur?

Would like to hear the experience of others.

Easton, Pa.

R. K. B.

VALVE STEMS THAT REQUIRED LUBRICATION.

Editor THE AUTOMOBILE:

[1,092.]—With reference to query No. 1,035 on Valve Stem Lubrication, in reply to O. A. Weiss, I wish to say that during the summer of 1907, I ran a car on which valve stem lubrication for the exhaust valves was absolutely necessary. If not lubricated, the exhaust valves in the rear two cylinders, and occasionally in the others, would at first "snap" slightly, then louder, and finally if not attended to would stick, sufficiently to cut out the cylinder affected. A liberal application of lubricating oil applied while the motor was running always cured the difficulty. If I had kept the car for another season, I believe I would have fitted grease cups, if possible, to avoid the frequent oiling. I believe, however, this is a fault of this particular make of motor, and if properly designed lubrication would likely not be necessary, as this is the only car that I have seen on which this has been the case.

Brooklyn, N. Y.

LOUIS P. REEDER.

MOON MODEL D, SEVEN-PASSENGER TOURING CAR

MORE than the usual interest centers on the Moon cars for the coming season, as, in addition to the output of the factory which will be marketed under this title, they will also be sold in the East under the name of Hol-Tan by the Hol-Tan Company, which formerly handled foreign cars exclusively. As has come to be very general practice with American manufacturers within the past few years, the builder, the Moon Motor Car Company, of St. Louis, will concentrate its attention on the production of a single, standard type of chassis, which, however, will be marketed as three distinct models, namely, a roadster, a five-passenger touring car, and a seven-passenger touring car. L. P. Mooers, the designer of the car, has been identified with the building of automobiles in this country for such a length of time, that his name in connection with a car is a sufficient guarantee of its close adherence to well-recognized engineering principles, as well as the incorporation of a number of special ideas of construction gleaned in a number of years' experience.

Foreseeing that the bulk of the present demand is rapidly leaning more and more strongly toward the moderate powered car, and that the ultimate demand will be almost entirely for a vehicle of this type, he has made the motor of a corresponding size, the bore and stroke measuring 4 1-2 by 4 1-2 inches, giving a maximum output of 38 to 40 horsepower at 1,200 r. p. m. on a brake test, thus permitting the car to be advertised as a 35-horsepower machine in full confidence that it will easily exceed its nominal rating whenever called upon to do so. In design the motor differs radically from the standard type in that a superimposed camshaft is employed and is driven from the crankshaft by a vertical spindle and bevel gearing placed at the forward end of the motor, as will be apparent upon reference to the illustration of this essential. A beam-axis rod is placed below the camshaft, on which the double-end, bell-crank beams rock, each beam working the two valves of the cylinder beneath it by means of an integral bell-crank fork, carrying a roller which comes in contact with the cam. The top of the camshaft turns toward the bell-crank roller, thus pushing

instead of pulling. The valve stems are slightly staggered, thus bringing the valves themselves inside a compression chamber but slightly larger than the bore of the cylinder. The valves are placed in cages and the tapered inner ends of the latter are ground into their seats in the cylinder heads. The bell-crank roller is held against the cam face by a coiled spring, hooked into the beam. This construction makes both valve cages the same,

requires but one cam for each cylinder and but one camshaft, though still retaining the much-desired opposite disposition of the valves. It also permits of liberal water spaces, so disposed as to insure effective valve cooling. Circulation is taken care of by a gear-driven centrifugal pump, while the essential of oiling is provided for by a mechanical force-feed type of oiler, having eight leads to the main bearings and other important points so that all the latter are kept directly supplied with oil, this being supplemented by splash in the crankcase. The latter is of aluminum, in two parts; the lower being but an oil pan, all bearings being attached to the upper half, thus making inspection and adjustments easy. Ignition is of the high-tension order and for running service a self-contained unit in the shape of a Simms-Bosch magneto is provided. For starting, and as a reserve, a standard four-unit coil and low-tension timer system, taking current from a set of accumulators, is installed. The mechanical oiler is driven from the overhead camshaft by means of a round leather belt.

The first step in the transmission of the power consists of a multiple ring type of clutch. It comprises 53 rings, or disks, all being of the same material, steel.

Twenty-six of these are held by tongues on the inside, or female member of the clutch, while the remaining 27 are held outside by grooves, in the male member. These rings are very thin, averaging but little more than 1-32 inch in thickness, thus making the complete clutch very compact. The large number of rings makes the clutch drive very well when in slipping engagement, this also giving it a soft action and preventing any jerky movement in starting. One universal is placed between the clutch and the

VIEW OF SUPERIMPOSED CAMSHAFT.

SOME ESSENTIALS OF THE MOTOR.

which squared revoluble locks are placed on two trunions, set at an angle of 180 degrees, and which slide on the outer member. They are protected by flexible leather casings.

The gear-set housing consists of two aluminum members, joined in the plane of the line and countershafts, which are supported on bearings of Parsons' white bronze, the housing being designed particularly with a view to compactness in view of the

line shaft of the gear-set, while universals are also used at each end of the propeller shaft, all being of the same type, with the exception of the first, which is made with its shell split so as to facilitate assembly. These joints are of the well-known trunnion type in

are inserted and brazed, extending through to the wheel hubs at their outer extremities, the driving axle being of the full floating type. A spur differential is employed, the pinions running on four-point ball bearings, while the rear wheels are run on three-point ball bearings. Brakes are of the external contracting and internal expanding type, the friction surface being lined with camel's hair belting, the outer bands being so applied as to make the brakes equally effective in either direction. The brake equalizers are steel tubes suspended by links jointed transversely at the top and longitudinally at the bottom. The brake rods are attached at the center of these long, tubular steel equalizers, thus perfectly balancing the resistance of one brake against the other and making a simple arrangement not likely to become deranged.

Full elliptic springs are employed on the rear and semi-elliptics in the front, the latter being jointed in front and linked at the rear, while the rear springs are revolubly mounted on the rear axle saddles, or perches, and are similarly connected to trunnion brackets attached to the side frames at the top. In order to provide ample room for spring action at the rear, the ends of the side members of the pressed steel frame are raised 3 1-2 inches. The steering gear is of the screw and nut type, consisting of two threads, or screws, a right and left-hand one, on the steering column, with integral nuts and pushers communicating the

ATTRACTIVE LINES OF THE MOON ROADSTER AS SEEN FROM THE RIGHT HAND SIDE OF THE CAR.

size of the pinions employed. The countershaft, or lay shaft, is placed to the left of the line shaft and the arrangement of the pinions gives four forward speeds and reverse, working on the selective type of operation.

As the design of the car has been very thoroughly tried out in the past two years or more that it has been on the market, scarcely any changes were found necessary in the chassis for the coming season, the few that were made consisting of that refinement of detail suggested by experience with a large number of cars. There are numerous points about the construction which, unimportant in themselves, when taken as a whole, are strongly indicative of the painstaking attention that has been devoted to the evolution of the entire design. For instance, both front and rear wheels are dished, the knuckle pins being slightly inclined in the case of the forward pair, thus bringing the top ends of the pins nearer together than at the bottom and making the wheel spokes stand vertically, from the road surface to the hub. In the same manner the rear axle is given a certain amount of camber, to achieve the same end in the case of the rear wheels.

The front axle is one-piece steel drop forging of I-beam section, while the rear axle load-carrying member consists of a steel casting in the shape of the bevel-gear housing, into which steel tubes

motion set up by turning the wheel to the double-ended bell-crank member of the steering arm. The cross-connecting rod of the steering gear is placed behind the front axle in a protected position. Control is of the usual type, both spark and throttle levers being situated on a stationary segment above the steering wheel. The mahogany "front board" carries the eight sight-feeds of the oiler, but is otherwise practically unencumbered.

REAR WHEEL ASSEMBLY AND SUSPENSION.

NUMEROUS special new features mark the Cleveland car for 1908 from its predecessor, prominent among them being the adoption of a multiple disk clutch, which, in accordance with the highest standards of practice in this respect, is housed together with the gear-set, thus making a unit of this important essential. This clutch consists of 52 steel plates, 1-16 inch thick, made of special high-carbon steel. They are stamped into a conoidal form, differing from a true cone in that the surface is slightly curved. This arrangement causes the plates to engage very gradually and when released, the spring of the material, aided by that of the curved portion, causes the plates to separate, regardless of the character of the lubricant employed, it being the claim of the makers, the Cleveland Motor Car Company, 1659 Broadway, New York City, that this clutch will disengage as readily when immersed in heavy oil or grease as when light oil is used. In actual service the same lubricant as is employed in the gear-set, consisting of one-half heavy oil and half grease, is employed for the clutch as well. The rockers for disengaging the clutch are provided with steel rollers at their ends, engagement of the clutch proper being effected by a heavy helical spring, of approximately 300 pounds tension, the latter being adjustable to suit varying conditions. This clutch is entirely self-contained and gives no end thrust except when disengaged, when the thrust of the spring is taken on F. & S. annular ball bearings of liberal size. The gear-set provides four forward speeds and the usual *marche arriere*, working on the selective principle of gear-changing, the lever being operated in an H-shaped sector. Though standard in this respect, a distinction is to be found in the fact that the direct drive is in the third speed, the fourth being an accelerated speed. This

arrangement permits of almost constant use of the direct drive with a consequent saving of the gears, and also provides an extra high speed on occasion, when the propeller shaft can be made to run faster than the engine. Annular ball bearings are used throughout the gear-set, and the shafts are milled, forming four integral splines for the sliding members. Immediately behind the gear case is placed a 14-inch wheel provided with heavy ratchet teeth and a plunger pawl, this device constituting a convenient substitute for the sprag. The base of the pawl is an accurate sliding fit in a small cylinder, thus forming a dash pot. It is operated by a small button located on the footboard, but a slight pressure of the heel being sufficient to cause it to act.

A bevel type of differential is employed, using liberal size gears of five pitch, all being supported on annular ball bearings. An adjustment is provided so that the bevel pinion and its shaft can be moved slightly in a longitudinal direction, thus bringing the teeth into, or taking them out of mesh with the large driving bevel. In order to provide for this, the annular bearing in front of the bevel pinion is held against a collar on the bevel pinion shaft on one side, and a nut on this shaft at the other side, so

that if this bearing is moved in either direction the bevel pinion and shaft must move with it. On the exterior of the annular ball race are threads into which, or upon which, an outside band or collar is screwed. This collar cannot move backward or forward, as it fits into grooves in the rear-axle housing, so that by simply turning it on its threads the bearing is forced in either direction as desired. This collar is prevented from rotating and is retained rigidly in position by means of a tight-fitting yoke which presses upon it when bolted in position. It also bears on the outside annular ball-race,

VIEW OF WORKING SIDE OF THE NEW CLEVELAND MOTOR FOR 1908.

DETAILS OF ONE OF THE UNIVERSAL JOINTS.

thus clamping the combination rigidly in position, adjustment being made by merely loosening the yoke and turning the collar.

The rear axle is of the floating type, driving the wheels by means of lug clutches at the ends. The supporting housing or axle is well braced by means of a 5-8-inch truss rod, this being its dimension at the smallest section, increasing considerably at the portions where it is threaded for the turnbuckles—in fact, the liberal size of the parts used throughout the construction of the car is one of the distinctive features of the 1908 Cleveland. An I-beam torsion rod is employed and radius rods are also fitted, their rear ends being revolvably mounted upon split bronze bushings, which are clamped around the steel rear axle housing, thus concentrating all the wear on the bushings. The latter also serve for the swivel mounting of the rear spring seats. The front axle is a one-piece I-beam drop-forging, the steering knuckle pivots being mounted on ball bearings while the cross rod of the steering gear is placed behind the axle in a protected position. The steering gear is of the standard screw and nut type.

Brakes are both of the internal expanding type, in contrast with general practice in this respect, and differ further from the latter by the provision of a special double drum, as shown by the reproduction of a photograph in one of the accompanying illustrations. This provision should go far toward increasing the efficiency of the brakes by effectually preventing any tendency to overheating on long steep grades, where it is necessary to alternate from one to the other in order to hold the car, or where both

SHOWING THE SEPARATE BRAKE DRUMS.

are used together. The outer one of the two brakes is 16 inches in diameter by 3 inches face, thus providing an unusually liberal amount of friction surface. Both are of the metal-to-metal type, the drums being of pressed-steel construction, while the bands are manganese bronze, both being operated by a cam in the usual manner. A single-tree type of equalizer is employed on the foot brake, which is the outside band, the other, or emergency brake, being operated by the usual side hand lever. Pressed steel is also used in the construction of the muffler, which is provided with a cut-out operated by a foot button. At every point on the car where there is any movement grease cups are provided, while the brake rods and spring eyes are equipped with spring oilers. The muffler rod, sprag operating rod and brake rods are all so arranged that the pull on them is direct.

The motor is of the standard, four-cylinder, four-cycle, water-cooled type, the cylinders being cast in pairs. Two independent

systems of ignition are employed, both being of the high-tension type. A high-tension magneto is employed on the running side, while a single vibrating coil and distributor system constitute the reserve, current being supplied by a set of accumulators. Each system is independent throughout, as two sets of spark plugs are used, both being placed over the valves. All the accessories are driven from a special shaft, the rear end of which operates the pump and magneto, while a belt from a pulley at its other extremity drives the bronze-hub aluminum fan directly back of the radiator. A Schebler carburetor takes care of the essential of gas supply, being provided with gasoline from a 22-gallon copper tank placed under the seat so as to feed by gravity, a large strainer being interposed between the tank and carburetor. The tank filling hole is made six inches in diameter, so as not alone to facilitate replenishing it, but also to make possible its thorough cleaning out, the cap being held on by a removable yoke, instead of the usual screw fastening.

A special feature of the cardan shaft drive is the simple type of universal joint employed. One of these is illustrated in pieces in order to show the small number of parts forming its essentials, as well as their simplicity. These joints are inclosed in dust and oil-tight housings, the forward part of the housing having a spherical rear end over

DETAILS OF THE INGENIOUS SPRAG.

which the rear portion of the case fits, the latter being provided with an internal annular recess containing a strip of felt. This felt comes in contact with the spherical portion of the forward part of the case, thus making a dust-tight but flexible joint. The rear universal joint is so arranged that the driving effort is transmitted by the outer ends of the arms fitted with bronze shoes which are free to slide longitudinally in suitably shaped semi-circular grooves of considerable length in the outside casing, which is fixed to the bevel pinion shaft. The casing is of steel and has a long hub taper keyed to the integral bevel pinion shaft, the shaft pinion being supported both front and back by F. & S. annular ball bearings of liberal dimensions.

Another special feature of the car is the use of an aluminum steering wheel of large diameter, the arms being of aluminum, channel section and having a continuous, integral rim. The control levers operate on an aluminum sector, each lever being provided with a small hard rubber thumb button, automatically locking it when the hand is removed.

THE SPECIAL CONOIDAL CLUTCH AND GEAR SET

COMPILERS E. R. MIXER AND EDITOR ROBERT BRUCE IN THE OFFICIAL AUTOMOBILE BLUE BOOK CAR, WHICH IS A THOMAS FLYER.

TWENTY THOUSAND MILES THUS FAR BY THE BLUE BOOK CAR

THE automobile tourist who travels by "The Official A. A. A. Automobile Blue Book" during 1908 will find that the publishers have not been idle the past few months in revising many sections and writing up new territory, long neglected, that affords every temptation to those who enjoy good roads, whether they are traveling through the mountains or along the seashore.

In the last five months the compilers have prepared over 20,000 miles of route directions from data collected by personally covering every mile with the Blue Book car—which is a Thomas Flyer runabout—and taking the exact distances to the tenth of a mile for every turn, fork, or landmark along the road. The machine has been equipped with two reliable odometers, and there

should be no question in the tourist's mind as to how far he must travel before the next turn is made. He has the running distances for all points along the road where any information is needed.

A good share of time and work has been spent in the thinly settled sections—sections noted more for their beautiful scenery and climate than for population—where in encountering forks and turns definite information is always welcome and indispensable. Nearly the entire coast of New England has been skirted; the White mountains have been handled in a most careful way, covering every desirable road to the Canadian line; nearly all of the necessary routes in Massachusetts will be well described, even to the farthest point on Cape Cod—a section lately discovered to contain the finest automobile roads in the country.

Every mile in New Jersey territory, from the mountains in the north to Cape May in the south, will have new and exact running directions; the eastern edge of Pennsylvania has been

worked out, and many of the exits and entrances to Philadelphia carefully taken care of. The Hudson river routes will look different to the stranger who has ventured that way and always finds trouble in getting through on the right road. Everything has been thoroughly explored in that direction.

Long Island has been covered from one end to the other and from the north shore to the south shore on all important cross-roads. It will be taken care of in the coming edition in a far more detailed way than has ever been accomplished at any previous time.

Most of this data has been made during severe weather, but with constant plugging the task has been accomplished and the efforts will be well appreciated by those desiring good, reliable directions for 1908. The endorsements of high-class hotel and garage accommodations have been carried forward in the same careful manner that the Blue Book contained during 1907—a feature well appreciated by the tourist traveling in strange territory.

ANOTHER OWNER WHOSE UPKEEP HAS BEEN ECONOMICAL

Editor THE AUTOMOBILE:

I notice in your issue of December 12, 1907, the detailed car expense account of B. N. C., of San Francisco, and it appeared so excessive that it impelled me to look up my own account, particularly because from the description of the car I suspect that it is of the same make as my own.

I received my 1907 model car about the middle of December, 1906, but on account of adjustments required before it was acceptable, and continuous rainy weather and mud, it was nearly two months before it had much use. It has been used on the eastern side of San Francisco bay and to the south, where the roads are good, no trip exceeding 125 miles per day, and a total to date of between 3,000 and 4,000 miles only.

I have stabled the car at home, and have looked after such minor repairs and adjustments as time and inclination would permit. Such work as putting on a trunk rack, muffler cut out and adjustments requiring considerable time in dismounting and reassembling has been sent to the shop.

My original tires, 32x4, are still in use, and the outer casings are not broken, showing only such cuts and wear as might be expected with careful use on fairly good roads. I have bought two extra inner tubes as a precaution. After following the advice to use plenty of oil, and wiping most of

it off the outside of the engine and connected parts, I settled down to my previous practice with a former runabout, and have found that the machine will do upwards of 300 miles per gallon, runs just as well and is much cleaner.

Gasoline consumption is not as satisfactory. I do not think that the carbureter is well adjusted in that particular, but the car performs well, and I imagine that any adjustment which would increase its mileage per gallon would be liable to decrease its efficiency.

My expense account to date is as follows:

Shop repairs, new additions and adjustments.....	\$79.75
Extras added to original equipment.....	45.45
Gasoline	91.40
Oil	10.00
Lights, carbide and coal oil.....	10.00
Two inner tire tubes.....	18.00
Repair of punctured outer tire case.....	6.53
	<hr/>
	\$261.10
Cr.: Two inner tubes of former car, at \$4.50.....	\$9.00
36 lbs. worn out casings of same, at \$0.08.....	2.88
	<hr/>
	\$11.88
	<hr/>
Total expense.....	\$249.22
SAN FRANCISCO, CAL.	G. H. S.

ECONOMICAL MILEAGE BY TWO OWNERS.

More facts are daily coming to light of the economical upkeep of cars by enthusiastic owners. Some of these records are sent to manufacturers by customers, and Thomas B. Jeffery & Company, Kenosha, Wis., announce the receipt of two letters which show the possibilities of the situation where the average owner of an automobile is concerned. And this is just the point, for these expense accounts have not been the result of the expert superintendence of the trained factory man, but those of the autoist who, in many cases, had but a faint notion of what was under the bonnet of a car before he actually became the owner of one.

One from Walter A. Merrill, of Binghamton, N. Y., states that he has run his Rambler car 4,000 miles during the past year with a total repair bill, outside of a few punctures, of \$9.40. During the season he has made 273 trips and has never required assistance on the road. His letter states that he calls that "real economy."

J. A. Baughman, of Barberton, O., states that he owns a 1906 Rambler, Model 14, which he has run up to date 8,500 miles at a total repair expense of \$4.

AUTOWAY IN WEST FOR SPEEDING.

WAUKEGAN, ILL., Jan. 9.—Automobile enthusiasts are much concerned in a persistent rumor that there is a project on foot to locate a costly speedway between this town and the Wisconsin State line. The alleged purpose is to hold auto events of a racing and speeding nature over a three-mile track built of concrete.

It is claimed that this project has been mooted since last October and the apparent secrecy with which it has been carried on was and is for the purpose of securing options on land at fair prices. It is now claimed that options covering over 500 acres have been secured, and it is expected that the scheme will be outlined at an early day.

The land on which the options have been taken lies in the path, as it were, of the famous Sheridan drive that ultimately will connect Chicago with Milwaukee. The driveway lays along the shore of Lake Michigan and now connects all of the North shore suburbs almost to Waukegan. It is rumored here that Eastern capital is back of the speedway project, but the names of the backers have not yet been made public.

THIRD ANNUAL MEETING OF THE AUTO ENGINEERS

MORE than the usual amount of interest attached to the holding of the third annual meeting of the Society of Automobile Engineers, which took place during the afternoon and evening of Friday last, January 3, as the need for an organization of this character in the automobile field has been most strikingly manifested by its exceedingly rapid growth during the two years of its existence, which, from the outset, has been under disadvantageous conditions of a sufficiently serious nature to cause the immediate dissolution of any association in which the members were not genuinely interested and eager to come to its support. Probably the most convincing evidence of the demand there is for such an organization is to be found in the report of the membership committee, showing that the list of members has been increased by more than 50 per cent. during the past twelve-month, despite the fact that no organized effort has been carried out either to secure publicity or to enlist the interest of the technically skilled branch of the automobile fraternity as a whole.

New Constitution and By-laws Proposed.

The afternoon session of the meeting was opened by President A. L. Riker, H. M. Swetland being appointed secretary *pro tem.* in the absence of E. T. Birdsall, secretary-treasurer. The minutes of the last meeting, which was held at Buffalo and Niagara Falls on July 30 and 31 last, and which included an inspection of the plants of the George N. Pierce Company, and the E. R. Thomas Company, having been read, the reports of the various standing committees were in order. Henry Hess, chairman of the committee appointed by President Riker at the summer meeting to revise the constitution of the society, reported that after carefully investigating the constitution and by-laws of several kindred organizations, his committee had come to the conclusion that the constitution of the American Society of Mechanical Engineers was the most carefully worked out, and was based on the results of a long existence and gradual expansion from small beginnings. "As it is hoped that this Society will also maintain as healthy a growth as its members may so far congratulate themselves upon," continued Mr. Hess, "your committee thought it could not do better than to follow very closely the Constitution, By-laws and Rules of the American Society of Mechanical Engineers, with, of course, such alterations and additions as the somewhat different objects of your Society rendered advisable."

Mr. Hess accompanied his report with a carefully prepared draft of the proposed constitution and by-laws founded on those of the American Society of Mechanical Engineers, with such alterations as the changed conditions and aims of the Society of Automobile Engineers required, and a resolution was passed instructing the secretary to have copies of the same printed and forwarded to the members for their approval or disapproval.

President Riker then called for the report of the committee headed by Mr. Schaeffers, which was appointed at the summer meeting, to come to an agreement with the Automobil Technische Gesellschaft, Berlin, for a mutual interchange of memberships, but in the absence of Mr. Schaeffers and the statement of his committee that the negotiations had not been concluded as yet, further action in the matter was deferred till the next meeting. Reading of the report of the treasurer was also deferred owing to the unavoidable absence of Mr. Birdsall. Chairman H. F. Donaldson of the Publication Committee reported on the activities of his committee during the past six months, which chiefly concerned the securing and publication of papers to be read at the regular meetings, a duty which, under the new constitution, will be devolved upon two separate committees. He was followed by H. M. Swetland, chairman of the Entertainment Committee. At the last meeting it was decided to make the

membership committee a committee of the whole, so that no formal report was prepared, but the successful outcome of the plan was apparent in the fact that during the past year the membership of the society has been increased by over 50 per cent.

The annual election was then held, Thomas J. Fay, New York, being unanimously elected president; E. T. Birdsall, Rochester, N. Y., second vice-president, succeeding John T. Wilkinson, and Henry Hess, Philadelphia, succeeding Mr. Birdsall, formerly secretary-treasurer, the constitution of the society prohibiting the holding of the same office for more than one term. F. J. Newman, Chicago, and Russell Huff, Detroit, were elected managers for three years, vice H. Vanderbeek and A. H. Whiting, whose terms expired. The other officers of the Society are Henry Ford, Detroit, first vice-president, and L. T. Gibbs, H. M. Swetland, H. P. Maxim and W. H. Alden, managers. President Fay appointed Charles B. Hayward as secretary, succeeding E. T. Birdsall.

Following the business meeting, papers on various subjects were read, including "Automobile Hub Bearings," by Henry Hess; "Some notes on Self-Aligning Taper Bearings," by H. W. Alden; "Nature Hard Gears," by Thos. J. Fay, and "Usually Unobserved Refinements of Automobile Construction," by J. Magee Ellsworth and Thos. J. Fay. Most of the papers were accompanied by numerous drawings illustrating the points brought out by their authors, Mr. Hess also accompanying his by sample bearings taken from automobile rear wheel hubs, showing the destructive effect of rust and grit on this important part of the car. Each one of the papers brought forth considerable discussion and numerous interesting points were raised.

Upon the conclusion of the discussion following the reading of the last paper, the afternoon session adjourned to reconvene at the annual dinner held at the New Grand in the evening. This was in turn followed by a second session of the business meeting, during the course of which numerous important matters came for discussion.

Next Meeting at Boston in March.

It being the consensus of opinion of the members present that the society should meet more frequently, it was decided that in future quarterly meetings should be held, and the importance of the Boston show being realized, a resolution to the effect that the next quarterly date be anticipated somewhat in order to bring the meeting during the course of that show, was unanimously adopted. The point was raised as to whether formal papers should be prepared and read at these quarterly sessions, or whether topics for discussion should simply be suggested in advance, and discussed informally at the meeting.

It was decided that papers should be prepared, and a number of the members, well known in the automobile world, volunteered to write on various subjects, among those suggested being "Materials and Design of Automobile Crankshafts"; "Die-forgings for Automobile Work"; "The use of Alternating Current Rectifiers"; "Improvement of the Two-cycle Motor"; "Drawing Room Equipment for Automobile Factories," and others of an equally interesting nature, many of which are to be prepared in time for reading at the Boston meeting, the secretary being instructed to print and distribute these papers in advance of the date.

The following were present: A. L. Riker, Henry Hess, H. F. Donaldson, J. M. Magee, Joseph Tracy, M. C. Krarup, H. M. Swetland, J. A. Crowley, Thos. J. Fay, H. L. Towle, W. P. Kennedy, A. H. Whiting, H. H. Brown, H. P. Moorrees, J. A. Anglada, R. W. Funk, R. Newton, Thos. Zimmerman, P. M. Heldt, A. C. Bergman, Wm. Hasselkus, A. H. Ehle, A. L. McMurtry, B. D. Gray, H. M. Crane, E. F. Schnuck, M. R. Hutchinson, and C. B. Hayward.

A Conflict of State and Municipal Legislation.

In the matter of legislation, New York State has long been looked upon as one of the most progressive communities in the Union, and its lead in dealing with the legal side of the many problems of commercial and domestic relations has been followed by a large number of the other States. The same thing is true where automobile legislation is concerned, but the recent decision of the Court of Appeals, in the case brought to test New York City's much discussed ordinance, would appear to place it in quite a different light. Under the Motor Vehicle law of New York, local ordinances are prohibited except where they impose a uniform speed limit of ten miles an hour on all vehicular traffic, and signs are posted to that effect.

Despite the fact that the law has not been complied with in the latter respect, the court of last resort has held that the ordinance is valid, but to support this contention it has been necessary to make the State law begin where the city ordinance leaves off. In other words, the autoist who exceeds the archaic eight-miles-an-hour municipal restriction, but in doing so does not surpass the ten-miles-an-hour limit of the State law, is amenable under the former and the maximum penalty incurred cannot exceed \$10. If he break both by driving more than ten miles an hour, then the State law becomes operative.

Despite the fact that no vehicle capable of exceeding it ever keeps within the absurd limit nominally imposed by the city authorities, something which practically renders the present municipal ordinance void despite the court's decision to the con-

trary, such a situation can only lead to confusion and dissatisfaction. While the recognition of New York's ordinance, without the condition attached to it by the court's decision, might be desirable from several points of view, if its upholding were to precipitate a flood of local ordinances throughout the State, the privileges gained under it would be dearly bought. The endless annoyances arising out of the pernicious activity of village councilmen brought about the general prohibition of local ordinances which is now a feature of most State legislation. Of what value will uniform State laws be if they are such only in name?

Singular Phase of the Desire for Speed.

With the unprecedented capacity of the automobile for speed, and the fact that it represents the culmination of human invention to satisfy the innate passion of the average individual to be able to travel quickly and at the same time control his own mode of getting over the ground, it is not strange that the ways in which the latter has been manifested have been numerous. Not the least strange of these is the desire of the autoist whose circumstances limit him to the possession of a low-powered car to make it a vehicle capable of traveling at a far higher rate of speed than its creator ever intended it for.

After having enjoyed the use of such a vehicle for a season or more, its efficiency is not what it was originally and its owner's desire for greater speed and hill-climbing power has grown in inverse ratio to the car's falling off. More power and more speed is his demand, and to satisfy it the expedients of increasing the compression of the motor and of raising the gear ratio of the car seem to be those most frequently thought of. Of the two, judging from the number of letters received from correspondents, the latter appears to be the more popular, and the plans for increasing the speed of the car do not, in the majority of instances, include any provision for making a corresponding increase in its power. It should be borne in mind that speed is but one of the manifestations of power and its attainment involves other factors than that of the relative number of revolutions of the engine and road wheels, and the fact that every increase in speed shortens the life of every part of the car should not be overlooked. In most cases restoring the car to its original degree of efficiency will suffice to accomplish all that can be safely recommended in this direction, and the practice of tinkering a 10-horsepower runabout in an attempt to make it the equal of a 25-horsepower car is to be deprecated.

Brake Improvement on the Cars for 1908.

While it is with pardonable pride that the American manufacturer regards himself and his product as having progressed beyond the influence of foreign standards, where betterment is concerned, the unprejudiced observer cannot but admit that the builder of European cars pays considerably more attention to the highly important essential of brakes than does his competitor in this country. It is a practice that the foreign builder has consistently adhered to for several years past, and while it may be considered that, in some instances, the factor of safety provided for has reached extremes, exceeding the requirements in this direction is more commendable than falling short of them.

American makers have practically abandoned the transmission brake where the 1908 cars are concerned, and inspection of the latter also bring to light the fact that more attention has been paid to the matter of the dimensions of the brake bands and drums, now almost universally to be found on the driving wheels, where they belong. Separating the friction surfaces against which the two brakes bear by making the drum double is also a most commendable feature, as in removing the heating influence of one from the other, this being a disadvantage where an external contracting and an internal expanding brake bear against opposite faces of the periphery of the same drum, both are made more efficient and at the same time entirely independent.

JANUARY DATE FOR NEXT A. L. A. M. SHOW IN GARDEN

MOST important of the decisions arrived at by the board of managers of the Association of Licensed Automobile Manufacturers at its meeting at the association's offices, 7 East Forty-second street, New York City, Tuesday, January 7, was the resolution adopted setting the time for the next annual show for January, 1909, in Madison Square Garden. This is practically a return to original show dates, and is an indication that the November-December dates of the 1907 show were not as advantageous as had been expected. Colonel George Pope, chairman of the show committee, in his report stated that the recent show had been the most successful of any yet held, but advocated a return to the January date as more suitable to recognized business conditions. Optimistic forecasts regarding business prospects for next season were made by several members of the Association.

Persistent rumors were current prior to and during the prolonged session of dissensions within the association, and of an intention to reorganize. Prominent members emphatically deny these reports, and General Manager M. J. Budlong stated that the same progressive policy would be

maintained in the prosecution of infringers of the Selden patent, and that the general policy of the association would be carried out as in the past. The following members were present at the meeting:

J. S. Clarke, Autocar Company; W. E. Metzger, Cadillac Motor Car Company; H. S. Hart, Corbin Motor Company; H. S. Lloyd, Electric Vehicle Company; B. A. Becker, Elmore Manufacturing Company; H. H. Franklin, H. H. Franklin Manufacturing Company; C. H. Haynes, Haynes Automobile Company; E. R. Hewitt, Hewitt Motor Company; E. H. Cutler, Knox Automobile Company; S. T. Davis, Jr., Locomobile Company; H. Lozler, Lozler Motor Company; C. W. Matheson, Matheson Motor Car Company; V. M. Gunderson, Northern Motor Car Company; F. L. Smith, Olds Motor Works; H. B. Joy, Packard Motor Car Company; L. H. Kittredge, Peerless Motor Car Company; Charles Clifton, George N. Pierce Company; A. L. Pope, Pope Manufacturing Company; George Pope, Pope Motor Car Company; E. D. Shurmer, Royal Motor Car Company; G. E. Mitchell, Alden Sampson, second; R. H. Salmons, Selden Motor Company; E. McEwen, F. B. Stearns Company; C. C. Hildebrand, Stevens-Duryea Company; H. H. Eames, Studebaker Automobile Company; E. C. Morse, E. R. Thomas Motor Company; E. P. Chalfonte, Waltham Manufacturing Company, and T. Henderson, Winton Motor Carriage Company.

MASSACHUSETTS MAY HAVE GRADUATED REGISTRATION

BOSTON, Jan. 6.—Governor Guild of Massachusetts apparently is not wholly satisfied with what the Legislature did last year in the way of putting the cost of the maintenance of the State roads upon the automobilists. In his inaugural address, delivered at the assembling of the Legislature for 1908, this week, he again devoted some space to a consideration of the question of automobiles and the roads and he again recommends that a system of graduated registration fees be put into force. The Governor also gets after the automobilists from outside the State, thousands of whom come here every year and use the improved roads without contributing anything for their repair or maintenance. That some legislation in the form of a measure for a graduated registration fee will be presented at this term of the Legislature there is little doubt, for members

of the Senate are still somewhat disgruntled at the defeat which they received at the hands of the House last year, when a deadlock was broken in the last days of the session by the Senate abandoning its bill for a graduated registration fee and permitting the House bill for a flat annual fee to pass.

Local owners of cars undoubtedly will oppose a graduated fee bill or any other change, because they believe that much harm is done by continually tinkering with the law, and that the measure passed last year should be given a more thorough trial before it is abandoned. They believe also that more inequalities would arise from the enforcement of a graduated fee than from the present flat fee system. Any proposition to put more burdens upon the tourist will be opposed by the many citizens interested in the lucrative summer resort business of this State.

MOTORING MAYOR OF NEW YORK RECOMMENDS WISELY

BY protesting against the exhaust cut-out, the use of sirens, smoky exhausts, and acetylene searchlights within the built-up portion of the city, Mayor McClellan of New York City has taken a step which will be approved by right-minded autoists.

It was in his annual message to the Board of Aldermen that the Mayor put forth his view on the control of automobilists while within the city. After pointing out that some provision should be made for licensing all sightseeing automobiles, which at present pay no fee whatever to the city, the Mayor protested against the use of the siren within the city limits on all automobiles other than those connected with the Fire Department. His other recommendations were that all automobiles should be equipped with adequate mufflers, which should never be cut out within the limits of the built-up portions of the city. That, ex-

cept for the first ten seconds after starting the engine, no smoke shall be allowed to come out of the exhaust pipe. It is wholly unnecessary and is simply an evidence of carelessness or incompetence. That the use of acetylene headlights within the built-up portions of the city should be prohibited.

If judiciously put into force, the regulations cannot be otherwise than beneficial to all users of the road, not excluding automobilists. Their practicability has been conclusively proved in European cities, where all the regulations have been in force for several years. The only case in which any hardship might occur would be in suppressing the smoke nuisance. It is here that the police ought to act discriminately. As to the other proposed regulations, they could not be applied too rigorously.

A. A. A. EXECUTIVE COMMITTEE HOLDS SESSION.

A meeting of the executive committee of the board of directors of the American Automobile Association was held Tuesday afternoon, January 7, at Association headquarters, New York City, President W. H. Hotchkiss presiding. Only routine Association business was considered.

HOME HONORS FOR PRES. WM. H. HOTCHKISS.

BUFFALO, N. Y., Jan. 6.—President William H. Hotchkiss of the American Automobile Association last week was elected president of the Erie County Bar Association, which gives an indication of the home appreciation of the energetic president of the national automobile organization.

AT THE GOODRICH STAND.

WHERE THE FISK PRODUCTS WERE ON VIEW.

DIAMOND TIRES WERE PLENTIFUL.

IMPORTERS EXPRESS SATISFACTION WITH SHOW RESULTS

SATISFACTION as the result of the week's efforts was expressed everywhere on the ground floor of Madison Square Garden when the Importers' Automobile Salon closed its doors and turned out the lights late on Saturday night last. Without exception, the importers of foreign cars declare good business was done, that prospects are bright, and that they have nothing but praise for the experimental Garden show.

Up in the gallery rather a different tune was hummed, the keynote of which was not altogether joyous. Thin attendance, though it may be everything that one can desire in the matter of quality, cannot make up for quantity when it comes to selling articles of common utility retailing at a low figure. "Altogether we have laid down about fifteen hundred dollars during the week," said the manager of one of the largest accessory stands, "and have very little to show in return for it. The people we expected to see have not responded to our invitations, and though there may have been plenty of car buyers we require the thousands who cannot purchase a car every few months but have always some money to spend on useful accessories and appliances."

Mr. Mabley Says There'll Be Another.

How it looked through official eyes was told by C. R. Mabley, general manager and secretary of the show committee, in a talk to THE AUTOMOBILE representative. "We have every reason to be satisfied with the Importers' show. I am rather sorry for the accessory men, for they have not done the business they expected to do; but every car exhibitor records good sales and excellent prospects for the coming season.

"Is the popular estimate of \$60,000 as expenses exaggerated?"

"Well, \$50,000 will not be far off the exact figure. Even apart from gate receipts, our show income is sufficient to pay all ex-

penses in connection with the exhibition, and when we close down we shall have, if not a balance in hand, at any rate a square account. From many standpoints it is a pity that there should be three different automobile exhibitions in New York, but there has been nothing in this exhibition to dissuade us from holding a second independent Importers' show next year on similar lines."

André Massenat, chairman of the show committee, and head of the Panhard & Levassor agency, said: "The show has been an unqualified success. Attendance has not been as high as we expected it to be, but we have had the right class of people, people who came with the avowed intention of buying cars, and did buy. I have assured myself by personal inquiries of every car exhibitor that good business has been done. As to the accessory exhibitors, I have only come in contact with two or three of them, and consequently cannot state what their impressions are. Everywhere we have been congratulated on the artistic arrangement of the exhibition and the practical placing of the cars and chassis in such a way that visitors could conveniently examine them in every detail, it being distinctive of this show that the majority of those attending it were connoisseurs of automobiles, who would not have been satisfied with a crowded group of cars. In principle it is already decided that an independent Importers' show shall be held next year. As to what lines it will take, whether it will be held here or elsewhere, cannot be determined at such an early date, but in principle we are decided to again run our own show."

Paul Lacroix, manager of Renault Frères selling branch: "Decorations and general display have made this show the finest spectacular automobile event New York has ever seen. From a business standpoint we have found it the best show in which we have participated. Attendance has not been large, it is true, but

WHERE THE HARTFORDS SHOWED.

TIRES AND RIMS AT THE MICHELIN STAND.

AT THE PENNSYLVANIA EXHIBIT.

we did not want persons interested in \$900 cars, for none of us attempt to supply such an article. People interested in high-class automobiles, able and willing to buy them, were desired, and we have had them in sufficient quantities to satisfy everybody. From our own business standpoint there is nothing but praise for the show, and our prospects for the year are so good that, in addition to an extended Eastern trade, we have made arrangements for direct Renault representation in the West, notably in Chicago and San Francisco."

Percy Owen, agent for the Bianchi car: "When this show was proposed we conservatively took a small space, believing that it would be sufficient for our needs. I regret now that we did not secure the maximum space allowed, for business results, by which I mean actual sales and not merely inquiries, have been far above expectations. To me the show has proved not only that there is a real interest in high-class foreign cars, but that a trade show is a much more successful proposition than the big national displays. At the latter you attract crowds of idlers with no other object than to see the sights and collect catalogues, only to throw them away. Here the idle, uninterested visitor has been conspicuous by his absence; those who came entered the show with a view to examining the cars preparatory to buying. One of the lessons which it has taught me is that importers should maintain a permanent exhibition, naturally planned on a more economical

R. I. V. BALL BEARING.

scale, but still following the general lines of this, where out-of-town visitors could examine under one roof all the principal models of foreign automobiles. Importers have not agencies throughout the country as in the case with American constructors, and they should, in consequence, offer some central point where it would always be possible to examine and obtain particulars of their cars. In this connection the Motor Mart naturally suggests itself as a central exhibition hall."

M. Neubauer (Delaunay-Belleville): "I believe I am correct in stating that the volume of business at this show has been equal to that of either the A. L. A. M. exhibit or the independent exhibition at Grand Central Palace. We have not sold the same number of cars, but all our sales having been of high-class and high-priced vehicles I believe that their total will form a record for this season's New York shows. Our own feeling is one of complete satisfaction. No mention of future plans has been made to me, but I see no reason whatever why we should not repeat the Importers' show next year."

Some New Things in the Accessory Division.

At the end of a series of automobile shows, in one or more of which all the numerous accessory makers have taken part, it was not to be expected that there would be a very fertile crop of novelties in appliances for use on or around automobiles. Naturally, where any particular novelty had been produced in the interval between last season and the present period of shows, it was endeavored to procure it in time for the initial exposition, and thus obtain the maximum of publicity. It is for this reason that the accessory stands at the Importers' show on the whole presented well-tried and standard lines, or novelties that were no longer entirely novel.

There were a few exceptions, either of things that appeared to have been overlooked in previous exhibitions or for some reason or other only turned up at the end of the show season. At the Bianchi stand M. Bousquet, European selling agent for the Bianchi

car, showed an air pump and self-starter designed to be fitted to any automobile. The compressor consisted of an air pump designed to be driven off the main shaft, or any other convenient position. For use as a tire pump no other connection would be necessary than a length of tubing sufficiently long to lead to any of the wheels. When the pump was desired as a self-starter, it was used to compress air into a tank from which it could be admitted to the cylinders through a distribution valve timed off the camshaft. The inlet device had been designed on simple lines.

A TABLOID MEDICINE CHEST.

A better known automatic tire inflator, recently introduced to America, was the Delpeuch, consisting of a compact cast-steel cylinder with supports, intended to be fixed in such a position on the car that the sliding pinion on its crankshaft could mesh with a toothed wheel on the driving shaft of the car. Generally between the clutch and the gearbox is found to be the most suitable position, though where no length of shaft is available here any other position can be selected. The inventors declare that no car has yet been found on which it could not be fitted. To put the pump into operation all that is necessary is to slip the sliding pinion into mesh, this being easily done by a command brought up to the dashboard. The automatic inlet valve is fixed in the piston head and the outlet valve in the cylinder head. A manometer and a rubber pipe completes the equipment. For work in garages a larger pump is made, with a water-cooled cylinder.

Léon Rubay's new production was the Gillett-Lehmann gasoline economizer, which, after considerable success in Europe, has been introduced to the United States. Claims made for the device are a saving in consumption of gasoline, increased power, and the avoidance of offensive exhaust gases. It consists of an adjustable air valve or plug screwed down to the top of the float chamber and connected with the small-bore tubes to the induction pipe, one attached on the engine side of the throttle and the other on the jet side. These are known as the balance pipes. The pressures on either side of the throttle are always varying with every movement of the throttle, but as both small pipes lead to the same small chamber in the economizer a mean pressure is created there, and it is thus that it exerts its economizing influ-

HEAVY DISMOUNTABLE TIRE BEING FIXED ON ITS RIMLESS WHEEL.

HOW THE STEPNEY WHEEL IS FITTED.

ence. It is claimed that every type of automobile can be fitted with the device without difficulty.

A new type of ball bearing introduced from Europe formed one of the attractions at the stand of the Auto Supply Company. To get away from the objectionable breakage of the cage holding the balls in position, the R. I. V. bearing has been made with an anti-friction ring cast

around the balls after they were in proper position in the bearing, but sufficiently free to allow them to revolve freely. The ring serves the double purpose of properly spacing the balls with a cage that is indestructible and assists in the proper distribution of the lubricant.

A medicine chest is generally too bulky an article to find a position on an automobile, much as its presence would be appreciated at certain times. At the booth of the Auto Supply Company the want was met in what appeared to be a perfect manner, a compact japanned metal box, no larger than the road book many an automobilist carries along with him, containing no fewer than twenty-five articles intended for first aid in the absence of a medical man or before his arrival. Just as an indication of how space was economized, a supply of cotton wool, which ordinarily would alone have filled the box, was compressed into a small package a couple of inches in length. Practically everything necessary for the treatment of minor accidents, burns or cuts was to be found in the case. At the same stand tea was treated in a similar manner, being compressed into small tabloids, two of which would furnish sufficient beverage for about three people. Sugar is supplied in the form of "Saxin," declared to be six hundred times sweeter than the commonly employed article, and of course compact in the same degree.

The only detachable rim on exhibition which had not been seen at previous shows was to be found at the stand of the Healy Leather Tire Company. Distinctive in the device is the absence of a wooden, steel-bound felloe, making a double rim, as employed on nearly every other make. The dismantlable rim is attached by means of a clip at the end of each spoke. Thus by the suppression of the wooden felloe and one steel rim the Healy device is as light, if not slightly lighter than the ordinary type of fixed wheel. Conversion of an ordinary wheel to a dismantlable is a simple matter and one costing but little. The metal rim is taken off and retained, the wooden felloe knocked off and discarded, then the end of each spoke cut down and turned to receive a steel socket with a couple of case-hardened lips, one fixed, the other attached by a nut and bolt, but not entirely dismantlable. It will be immediately noticed that the ordinary lugs and valve can be retained, an advantage which will be appreciated by the practical automobilist. In addition to the lip at the end of each spoke binding the face of the rim, there is the usual expanding motion on the entire rim, which should theoretically make a perfectly safe unit. According to the statement of the manufacturer, experiments carried on throughout the summer have proved the dismantlable wheel to be more than equal to the strains of a heavy car over the worst roads.

Though a newcomer to America, the Stepney wheel, shown at the Garden, is no longer a stranger, its own merits having brought it quickly before the public during the few months it has been on this side of the Atlantic. In brief, it consists of a metal rim without felloe, spokes, or hub, on which is carried an inflated tire. When not in use the wheel is carried on the side of the car in exactly the same manner as a spare shoe. On a puncture occurring, the deflated tire is left undisturbed, and the Stepney attached to the wheel by means of three or four clips—according to size of wheel—fitting over the clincher lip of the permanent wheel. Two of the clips are rigid and two are adjustable by thumb nuts, all that is necessary to secure the wheel being to get the fixed clips in position and tighten up on the adjustable ones, the use of a jack under ordinary circumstances being superfluous. To prevent creeping of the Stepney around the fixed wheel, a metal lip on the smaller sizes engages one of the spokes. For the largest wheels a couple of leather straps are passed around the clip and a spoke. No tools whatever are required for mounting the wheel, the time occupied is but a few minutes, and the Stepney can be run hundreds of miles with safety.

BRUSSELS SEVENTH ANNUAL AUTO SHOW, SECOND ONLY TO PARIS IN IMPORTANCE, HAD FORD AND REO IN FOREGROUND.

SEVEN DISTINCT EVENTS FOR ORMOND-DAYTONA CARNIVAL

WITH the addition of a stock chassis race to the program of the Ormond-Daytona speed carnival, from March 2 to 7, there are now seven distinct events for the world's fastest straightaway track. According to the entry blank issued by the Contest Committee of the Automobile Club of America, the stock chassis event will be five times round the 32-mile course, giving a total distance of 160 miles, and will be eligible to any American or foreign chassis, the maker of which shall have manufactured and delivered, or be ready to deliver before February 15, 1908, ten chassis similar in every respect to the one entered. No restrictions are placed on the body, other than that provision must be made for two persons and that a mechanic must ride along with the driver. Total piston area has been limited to 103.87 square inches, which will admit the equivalent of a four-cylinder engine having a bore of 5 3-4 inches. The prizes in the stock chassis event are a silver cup to contestants finishing first and second; entrance fee is \$100.

All other events are announced to be run under Vanderbilt Cup race conditions, limiting the weight of the car to 2,424 pounds. The center of attraction should be in the contest for the Automobile Club of America Cup, nine times round the course, or 288 miles, in which event some of the cars built for the last Vanderbilt Cup race should participate. Event No. 2 is a four-lap race for gentlemen amateur drivers, the trophy being a silver cup.

In the 100-mile race for the Minneapolis International Championship Trophy, won successively by a Napier car entered by S. F. Edge and by E. B. Blakely on an American Mercedes, entrance fee has been fixed at \$50. In this event, as well as in

the other long-distance races, the referee shall have power to make the starts as he may deem proper should entries be large.

Three short-distance events, for the Sir Thomas Dewar Trophy, the Two-Mile-a-Minute Trophy, and mile and kilometer records can only be entered by cars which have participated in the long-distance races, or accomplished a distance of 100 miles at an average of 60 miles an hour.

All events will be conducted under the Racing Rules of the American Automobile Association, over a 16-mile straightaway with loops at each end, affording a circuit of approximately 32 miles. As far as possible starts will be made at the clubhouse of the Florida East Coast Automobile Association, where the grand stand and officials will be located; the exact time of starting to depend on the tide and condition of the beach. The rule requiring contestants to be in the enclosure designed for them at least thirty minutes before the start of their race will be strictly enforced. All events, declares the official entry form, will be confined to white male drivers eighteen years of age or over. Entries, which should be addressed to Robert Lee Morrell, chairman of the Contest Committee of the Automobile Club of America, will be received until midnight on February 15.

Chicago Automobile Club's first entry for the Florida carnival is announced as G. F. Sulzberger's six-cylinder Stearns, which carried off the speed laurels in the Harlem track races last October. It is intended by the Racing Committee of the Chicago Club to organize a special train from the Windy City to Ormond in connection with the races. Chairman Gregory, Joseph F. Gunther, and Walden W. Shaw have charge of the arrangements. A big Western delegation is expected.

THREE MORE BRITISH ENTRIES FOR FRENCH GRAND PRIX

PARIS, Jan. 1.—England is coming out stronger for racing next season than was generally expected, for in addition to Ariel, already officially promised for the Grand Prix, Weigel has this week sent a letter in which he declares that in six weeks he will be over in Paris to show off his racers for the Blue Ribbon of the automobile world. Weigel is England's plucky but unlucky aspirant for speed honors who last year built a couple of eight-cylinder racers—which, by the bye, he now calls touring cars—and received as his reward a condemnation to one month in prison, without the option of a fine, for exceeding the speed limit. Naturally a protest was made, Weigel maintaining that the police had got mixed up on the cars, that his own machine had a slipping clutch and could not get on at all, and execution was suspended while the legal machinery went into operation.

The three machines for next year's race will have four, not eight, cylinders, bore being the maximum of 155 millimeters. What other features they will possess Weigel fails to say, except that they will, naturally, be marvelously fast and give the Frenchmen, Italians, Germans and Belgians a stern chase.

No decision has been arrived at regarding the choice of a circuit, Dieppe standing favorite, but half a dozen other districts are doing their best to attract the favorable consideration of the Racing Board. The suggestion has been put before the committee that if the Dieppe course is selected the race should be held in the opposite direction, the cars traveling in the same way as the hands of a clock, and that the tire and gasoline stations be placed opposite the grandstand, as was done so successfully in the first Grand Prix race on the Sarthe course.

SPECIAL CASH PRIZES FOR THE WESTCHESTER RACE

TWO certified checks of the value of \$750 and \$500 have been sent to Chairman Robert Lee Morrell as special prizes in the race for the Briarcliff Cup, planned to be held over a Westchester County, N. Y., course in the spring. The larger amount came from Joseph Gilbert, American manager for Continental tires, with a request that \$500 should go to the driver of the first car using Continental tires, and \$250 to the driver of the second car similarly equipped. Alexander Dow's check for \$500 is to be used as a cash prize to the driver finishing first with an equipment of Dow non-deflation inner tubes.

A knotty question confronts the Race Committee, as the result of Mrs. A. N. Cuneo's decision to enter the stock chassis race with a 45-50-horsepower Rainier, which she has recently

purchased. Thomas F. Moore is reported to have replied that he would personally like to accept the \$1,000, but that he has misgivings as to what his committee would say on the matter. Should the committee make up its mind that the lady's entry shall be accepted on the undisputed ability of the applicant to handle a car in a speed contest, then the check will be taken and the anger of the ungallant ones borne bravely. Meanwhile the secretary is waiting, with a blank sheet before him, to record the names of those itching to hand over a thousand-dollar note for the privilege of contesting the Briarcliff Trophy. When thirty cars have been received the lid will be put down tight, for the committee has decided that it will only accept one car for each mile of the course, and will make no further concession.

NEW YORK'S LEGAL AUTOMOBILE SITUATION CONFUSED

ALBANY, N. Y., Jan. 6.—Henceforth the lot of the autoist in New York City will be more interesting in that he may have an opportunity to choose under which law he wishes to be apprehended for violating the speed limit. If he drives more than eight miles an hour, but less than ten, it is then the duty of the first policeman who sees him to take him into custody on the charge of having violated the municipal ordinance, for which the maximum penalty is a \$10 fine. If his car happens to go eleven miles an hour, the same policeman may take him in, in the same manner, on the charge of having violated the Motor Vehicle law, under which the penalty may be anything up to a \$100 fine for the first offence; \$100, or thirty days, or both, for the second offence, and \$250, or thirty days, or both, for the third offence. So says, in substance, the decision of the Court of Appeals, handed down last week in the case of the *People vs. Hainer*, the opinion being by Justice Willard J. Bartlett.

W. M. Hainer is the chauffeur of Edward J. Flammer, a New York lawyer, and he was arrested in June last, charged with having driven his car at the rate of eighteen miles an hour. His employer contended that he should be fined under the city ordinance and released, but the magistrate before whom he was brought took a different view of the matter and held the driver for Special Sessions. Mr. Flammer procured a writ of habeas corpus, pending the calling of the trial, and Hainer was ordered discharged by the Special Term of the Supreme Court, before which the writ was argued. The people appealed, and pending the decision of the case by the Appellate Court, the city magistrates followed the ruling of the Supreme Court and violators of the speed law were uniformly subjected to a fine of \$10. Then the Appellate Division of the Supreme Court reversed the finding of the Special Term, and Mr. Flammer appealed to the Court of Appeals, which has just affirmed the decision of the court below in the manner already referred to above.

But in doing so, it does not appear that the court of last resort undertook to ascertain whether the municipality of New York had complied with the conditions precedent, giving it the right to pass a speed ordinance of its own under the Motor Vehicle law. The chief of these is that the speed limit so set shall apply to all vehicular traffic, and this has been complied with by the uniform restriction to eight miles an hour, but a second, and so far as the validity of the ordinance in question is concerned, an equally important condition, is that of placing signs at street corners, such as are commonly seen in the rural districts, stating the permissible speed. In this respect, New York City has failed to comply with the provisions of the State law, as such signs are only to be found in the parks. In view of this it would seem that arrests under the local ordinance could not be upheld until such signs are erected, though the majority of autoists would naturally prefer the lesser of two evils in the shape of the \$10 fine limit of the latter, to the much heavier penalties of the State law.

In its decision, the Court of Appeals takes the position that both the Motor Vehicle law and the municipal ordinance are in full force and effect concurrently, and that when a driver is arrested for having run at a speed of more than eight miles an hour, but less than ten, he is subject to nothing more serious than the \$10 fine provided as a maximum penalty in the latter, while if he exceeds ten miles an hour, he may be apprehended under the State law and either fined heavily within the limits of the penalties provided therein, or even held for trial in Special Sessions and have a bit of involuntary waiting at the city's expense thrown in should the verdict go against him.

The situation is an interesting one, in that it reveals the confusion that is bound to arise in permitting municipalities to pass their own speed ordinances, even under the restrictions of the present Motor Vehicle law.

GLIDDENS AGAIN OFF ON THE 'ROUND-THE-WORLD TRAIL

IN a short time Charles J. Glidden and Mrs. Glidden will recommence another phase of their self-imposed automobile pilgrimage, which has already taken them a distance of 42,367 miles and brought them in connection with thirty-five countries of the world. Since 1901, when the long ramble up and down the surface of the globe was commenced, new roads have been built, making further conquest possible, and it is now the intention of the doyen of automobile travelers to explore further into the Turkish domains and the countries encircling the eastern end of the Mediterranean.

To explore the new fields by automobile and drive in the oldest countries, headquarters will be established at Alexandria, Egypt. There is in this city a well-appointed automobile garage and drives can be made to places of note. West of the city, by aid of the compass, a journey will be made well out on to the Libyan desert beyond the recently-discovered city of Abu Mina, proceeding over the billiard-floor surface of the desert until it becomes too rough for driving, though a good surface is assured for two hundred kilometers.

Retracing the drive over the desert to Alexandria, it will be possible, though not easy, to follow up the Nile Delta to Cairo, the principal trouble being at the bridgeless streams, or at rivers where bridges are not strong enough to carry the automobile. The Gliddenites have had experience of this kind and are familiar with the work necessary to strengthen a bridge.

Cairo is 130 miles from Alexandria, and the excursions in Northern Egypt on the desert to the oasis and return ought to total about 500 miles. Drives south and east of Cairo to the

Pyramids of Gizeh, thence across the desert to those of Abusir and Sakkara, can be accomplished, and a good road runs from Cairo to Suez. By the middle of March, Egypt ought to have added 1,000 miles to the total distance covered by the Glidden party. Writes Mr. Glidden:

"It would be a hazardous undertaking to drive from Cairo to Jerusalem across the desert, as the Syrian coast is cut up by unbridged streams running down from the mountains, and the trail is principally a pack caravan route often infested with hostile Kurds. The sand of the desert in this section of Syria is soft and deep. It will therefore be necessary in order to reach Syria to ship the car from Egypt to Jaffa, from which place a good road runs to Jerusalem, the Dead Sea, the Jordan, and other points of interest. To reach Upper Syria it will be necessary to return to Jaffa and sail to Haifa, motoring from this point over the mountains of Samaria to Nazareth and the Sea of Galilee at Tiberias. Returning and sailing from Haifa, the next point in Syria will be Beirut. From this place a good road is assured to Damascus, Homs, across the Syrian desert to the ruined city of Palmyra and possibly to Babylon and the Euphrates, making a total drive in Syria of 1,500 miles.

"Carriages now run across the desert, which is smooth and hard, from Bagdad to Aleppo, and on this route there have been established post houses with sleeping and dining accommodations. It will certainly be unique to travel by automobile to these remote places in Western Asia, and the same car which has stood on the banks of the Ganges and in many sacred places in the world is now destined for the Jordan and the Holy Land."

CLEVELAND MAKERS LOOKING FORWARD COMPLACENTLY

CLEVELAND, Jan. 6.—Cleveland manufacturers and dealers are looking forward to the year with a great deal more complacency than was the case a month or six weeks ago. The financial condition is showing daily improvement, and real money is rapidly displacing the clearing house checks. Manufacturers in all lines who have laid off men are calling them back to work, and one of the best indications of renewed prosperity is the fact

SALES MANAGER R. F. YORK AT WHEEL OF 1908 STEARNS.

that collections are improving from all quarters. This general improvement in business conditions leads the automobile people to believe that while the business for the next month or so may be a little below the average there will be a splendid spring business. The local dealers are congratulating themselves that they decided to hold the local show in February instead of following

the example of the national shows. There is every indication that the actual business at the Cleveland show, which has always been large, will be greater than ever before because of the delay.

One of the best indications of the feeling of optimism is shown in the case of the F. B. Stearns Company, which throughout the financial stringency kept steadily at work on a large addition to its factory. This addition is now completed, and adds greatly to the company's capacity. R. F. York, of the Stearns Company, is now in California, and he reports that the company will get a very nice business from the coast this year. The Stearns factory is running practically a full day force on cars for immediate delivery.

The Peerless Motor Car Company has increased its working force within the past week or so and it now has about three-fourths of full force on full time. It reports that it has on hand more specified orders up to date than the same time a year ago. Business is reported remarkably good in view of general conditions. The Peerless branch at Boston has sold more cars to date than were sold up to March 1 last year.

A. R. Davis, of the Garford Motor Car Company, reports that business is most satisfactory. Two large limousines were sold last week to prominent Clevelanders, and agents are sending in an increased number of orders.

The Winton Motor Carriage Company is working a good-sized force for this time of year and is shipping many cars. All of the branch houses are reporting brighter prospects.

The White Company has practically a full force and is shipping about as usual. Walter C. White, vice-president of the White Company, who has just returned from London and Paris shows, says that foreign trade in Whites will be heavier than ever.

The Baker Motor Vehicle Company is working on large outputs of electrics for 1908.

THE AUTOMOBILE IS IN THE NATURE OF AN EVOLUTION

"THE automobile is bound to become one of the most stable in the United States," says B. A. Becker, of the Elmore Manufacturing Company, "for those concerns which have an output that is progressive and meets public demand.

"The automobile is in the nature of an evolution, and no evolution can be stopped; in fact, you can no more get along without the automobile to-day than you could without the horse. It annihilates distance better than any locomotive that has ever been built. It brings people out into the open air and invigorates the human system in a better manner than by any other means now in vogue. It combines three very essential points: the most comfortable means of travel, the betterment of health, and the supremest enjoyment of outdoor living.

"Compared with other years we have shipped more of this season's machines up to date than ever before in the history

of our plant. In fact, if we should not make more 1908 cars than we did 1907 cars, we have already shipped almost exactly one-quarter, or 25 per cent., of our output.

"From the present indications, it would appear that 1908 would be one of the best years that we have seen in the automobile business. Present conditions have not affected us up to date, and we consider that it is only a question of a short time when conditions will be normal.

"There is too much pessimism, we believe, in the business world to-day, and it disagrees with our ideas of things, as shown by the fact that we have more men on our pay roll at this time than we had at the same time last year. Our output, as in previous years, has all been contracted with a considerable extent of very desirable territory still open, which we would like to enter, and which will compel us to increase our output."

AUTOS HAVE BECOME A NECESSITY, NOT ENTIRELY A PLEASURE

"It is really amusing when I hear these pessimistic rumors regarding the lessening of automobile sales," said Benjamin Briscoe, Chairman of the Committee of Management of the American Motor Car Manufacturers' Association. "I presume these rumors are started by some irresponsible salesmen because a few orders for automobiles have been canceled. Because the water is being squeezed out of many worthless stocks and some institutions have been tottering, the reports have been flying broadcast that the demand for automobiles had been met.

"Any sane and broad-minded individual who has studied the situation knows that automobiles will always be sold. They have become a necessity, not entirely a pleasure. It has reached a stage when the public cannot do without them. Especially is this true in the commercial line. Motor trucks and delivery wagons cannot be turned out fast enough to meet the demand. If there is any salesman who feels he has sold all he can, the sooner he gets into some other business so much the better, considering the demand, especially for town cars, is very good."

DETROIT FEBRUARY SHOW TO BE A NOTABLE AFFAIR

DETROIT, Jan. 6.—From the automobile show of a half dozen years ago to the one of the present day is not a long hark in point of years, but it reveals some startling developments in cars. Possibly nowhere else in the country has this evolution been more forcibly emphasized than in Detroit, which was the first city in the country to have a local automobile show. It was a primitive affair, according to present standards, but six years has worked wonders, and at the time it attracted widespread attention. It is worthy of note that since its inception the pioneer show has been held under the name of the Tri-State Automobile and Sportsmen's Show, the seventh of which is underlined for February 10-15 at Light Guard Armory.

The original display contained a half dozen models of steam cars, nearly all of which are now unknown, and a single gasoline

car, made in Detroit. For the February show, Manager E. E. McMasters announces there will be twenty-five agencies and factories taking space, approximately fifty different makes of cars being exhibited. Applications were far in excess of this number, but it was found necessary to limit the exhibitors through lack of sufficient room to care for all.

As in the past, the gallery will be given over entirely to accessories. The drill hall in the basement will be devoted to a display of motorcycles, which promises to be most comprehensive.

When the Detroit Automobile Dealers' Association launched its recent show at Riverview Park it was predicted that would put an end to the old one. Quite the contrary, the interest displayed in the Tri-State show is greater than ever, indicating that it will equal if not eclipse all predecessors.

CLEVELAND'S FEBRUARY SHOW LARGER THAN EVER BEFORE

CLEVELAND, Jan. 6.—Specification blanks for the Cleveland show, to be held February 17 to 24, were sent out last week by Manager George Collister. The plans provide for a larger exhibit than heretofore, as the large banquet hall at the north end of Central Armory, heretofore never used for show purposes, has been secured and will give 5,000 more feet of floor space. This will be used largely for motorcycles, bicycles and accessories.

The balconies of the big hall will be used exclusively for accessories, while the main floor and wings will be used for complete automobiles. Only the limitation of space will prevent all the cars represented in Cleveland from being displayed, for with daily improvement in the outlook for business every dealer is anxious to get into the show. The show promises to eclipse last year's successful exhibition by fully fifty per cent.

POUGHKEEPSIE OFFERS GLAD HAND TO FRENCH FIRM

POUGHKEEPSIE, N. Y., Jan. 6.—It is hoped that the De Dion Bouton Company, of Suresnes, France, will be induced to locate its factory in Poughkeepsie. A representative of the French firm is investigating positions on the Hudson, and has already considered the claims of Albany and Newburgh, but it is believed that Poughkeepsie, with its railroad connections open to all parts and a waterway to the ocean, will be able to carry the day. The Chamber of Commerce has invited the representative to visit the town within a few days to look over the situation and review the advantages of the location. The impression is that the new firm does not desire any bonus, but it must have accommodations for its machinists and workmen, who will probably number about three thousand.

The De Dion Bouton Company, one of the oldest and largest in France, had a certain business connection with the United States in the early days of automobiling, supplying motors and parts to several firms now regarded as being at the head of the American industry. Of late years the business done here has been practically nil, the few imports being parts or an occasional commercial vehicle. The French works, on the banks of the Seine outside Paris, are devoted to the production of touring cars, stationary and automobile engines, and commercial vehicles, this latter class being now particularly important. Three thousand workpeople are employed, the annual pay roll being one million dollars. It is supposed that the American factory will be occupied largely with the production of commercial vehicles.

A. C. OF SPRINGFIELD HEARS ABOUT IGNITION.

SPRINGFIELD, MASS., Jan. 6.—J. O. Heinze, of the Heinze Electric Company, Lowell, one of the foremost electrical experts in the country, gave a very instructive technical talk before the Automobile Club of Springfield, January 2, on "Magneto and Coils." Before engaging in business for himself, Mr. Heinze was assistant to Professor Elihu Thompson of the General Electric Company. At the St. Louis Exposition he received highest awards for the construction of the most powerful induction coil.

The subject taken up by Mr. Heinze was confined to the relative merits of the magneto and spark coils as applied to automobiles. The speaker was emphatic in his statement that a magneto produced a greater efficiency in the gasoline engine than the spark coil, and that the auto can go farther on a gallon of gasoline when the gases are ignited by the spark of a magneto than by the spark of a coil. Instruments designed by Mr. Heinze were shown which disproved the commonly accepted theory that by advancing the spark early ignition is secured. The instrument showed that the spark at all times takes place at the highest point of compression.

MARYLAND MAY REBUILD OLD TURNPIKE.

CUMBERLAND, Md., Jan. 6.—Activity in the development of highways is clearly manifested in Maryland by the strong support which is being given the proposal for a State road or one main artery controlled exclusively by the State. The matter has been talked of for some time, and has been introduced to the Legislature, but was received at such a late stage of the session that its consideration was impossible. When the Legislature again meets this month the subject will be brought up, when it is hoped that the bill will pass into law. The State road, which when rebuilt would reach in Allegheny county from Flintstone to Grantsville, would be a great boon to tourists going over the old National Pike and the Baltimore Turnpike.

At a recent meeting under the auspices of the road directors of the county, in Cumberland, a resolution was adopted that a bill be framed and presented to the Allegheny county delegation for passage at the coming Legislature calling for a bond issue of \$125,000 for permanent road improvement, an equal amount to be secured from the State under the provision of the Shoemaker fund.

OPTION GIVEN ON POPE-TOLEDO PLANT.

TOLEDO, O., Jan. 6.—It is reported that at the meeting of the creditors of the Pope Motor Car Company and members of the Toledo Chamber of Commerce, held here last Friday, and which was presided over by the receivers, George A. Yule and A. L. Pope, that an option on the entire Pope-Toledo plant has been given to Joseph M. Schwab. Nothing definite regarding the terms of the agreement has been made public, but it is understood that the consideration is \$800,000, of which Mr. Schwab will pay \$650,000, Toledo interests raising the balance.

A QUAKER GIRL WHO KNOWS HER CAR.

When John Megraw, one of Philadelphia's prominent real estate men and capitalists, bought his daughter a Wayne roadster he little dreamed that he was performing a stunt that would develop his daughter into a veritable mechanic. But such was the case, and now, whenever any repair is necessary about the house, the Wayne enthusiast is first consulted before a mechanic is engaged to make the repairs.

MISS MEGRAW IN HER WAYNE.

So much does Miss Megraw think of her car, and so enthusiastic is she over its possession, that she jealously refuses to allow anybody to touch the auto insofar as the operating mechanism and its upkeep are concerned. If the gasoline tank is empty it is Miss Megraw who carries the can and fills the tank with the gas supply. If the oil pump is dry, it is Miss Megraw who raises the hood and fills the oil case with the lubricant. If the vicious nail or tack plays havoc with a tire, or if a plug ceases to spark, or if anything occurs that requires any attention, it is not a chauffeur or mechanic who attends to it, but Miss Megraw herself.

"I just love to putter around the working parts of my Wayne," laughed Miss Megraw as she closed down the hood after filling the crankcase with oil. "While I have never really had any trouble with my car, I tinker around a good deal just to satisfy my curiosity. I have driven all over Philadelphia during the past season, and now I am planning for some real tours next year. I want to take some trips into other sections of the country, and it was because of my desire to do such stunts that I have fitted myself to handle my Wayne both in driving it and in keeping it in running order."

HOW THE POPE-HARTFORD BROUGHT THE DELAYED STEEL.

A few weeks ago the Pope Manufacturing Company were at a loss to know what had become of a carload of steel which had been shipped from Elyria, O., to the factory at Hartford, and as the company was sorely in need of some of the cargo it traced the car to Albany, where the car had been sidetracked. E. J. Wall, traffic manager for the company, and driver Jim Young, started in a Pope-Hartford for Albany, found the car, and loaded all the raw steel they could on it, about a ton altogether, making the total trip of over 260 miles without a mishap, within twenty hours from the time of starting.

GEARLESS TRANSMISSION COMPANY'S NEW YEAR'S GREETING.

KNOX TO BUILD NEW FIRE TRUCK.

SPRINGFIELD, MASS., Jan. 6.—The City of Chicopee has just ordered the Knox Automobile Company to construct a new automobile combination fire truck for the city's fire department. The new auto truck will be the first of its kind ever built by an automobile manufacturer in the country, and is to cost \$5,000. The specifications call for a combination chemical, hose and ladder truck, equipped with a 1908 model, four-cylinder, 40-horsepower, three-speed, air-cooled gasoline engine. Its maximum speed will be twenty miles an hour and will be so built as to ascend grades at an average of ten miles an hour. The new auto truck's fire-fighting apparatus is to consist of two 25-gallon Holloway chemical engines, with 300 feet of hose and two sizes of nozzles. The whole outfit will weigh 7,500 pounds.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Continental tires, according to figures submitted by the makers, were more numerous than any others on the cars exhibited at the recent Importers' Salon, in Madison Square Garden.

The Cameron Car Company, of Brockton, Mass., has purchased the entire plant of the Beverly Mfg. Co., Beverly, Mass., including buildings and machinery. This plant gives the Cameron Car Company an addition of 60,000 square feet of floor space.

Still another addition is made to the ranks of the American Motor Car Manufacturers' Association by the election of the Tinscher Motor Car Company, of South Bend, Ind., which make the highest priced car of American manufacture. Their models range from \$5,500 to \$9,000. This gives 52 members to the A. M. C. M. A.

There are four Model X-I-V and two Model K Wintons in Santiago de Chile, and, according to J. S. Gilmor, they are giving "the best of satisfaction, and are all in perfect running condition. This is especially gratifying," he adds, "as the roads are abominable, the grades being rocky and steep. Their owners are enthusiastic."

Diamond wrapped tread tires, in both the quick detachable and regular clincher types, made conspicuously excellent records in the Quaker City Motor Club's endurance run January 1 and 2. Of the 49 sets of tires in use, 24 1-2 were Diamond, and their record, even under the trying road conditions, was an extremely clean one. There were 5 1-2 sets of Diamond tires on the seven cars finishing in the lead.

Never having had any springs break on his car in 30,000 miles' travel, during all of which time, however, the car was provided with Truffault-Hartford shock absorbers, Frederick Sadler, of Bloomfield, N. J., questioned their value, and removed them. In the three weeks following, two springs were broken, which quickly convinced him, and the shock absorbers have been replaced.

As an indication of the manner in which American exports of automobiles have grown during the past few years, the advance reports of the Department of Commerce and Labor for the month of November, 1907, show that for the 11 months ending with November in the years 1905, 1906 and 1907, the totals were as follows: \$2,499,010, \$4,167,032 and \$5,455,540, these figures including the value of both parts and complete cars.

As the first step in the carrying out of a new policy, the Studebaker Automobile Company has just opened a branch in Boston, and will follow it by opening branch houses in all the larger cities of the country. Aside from its other manifest advantages, the branch house brings the customer into closer touch with the manufacturer than is otherwise possible, and is an assurance that the purchaser's interests will be looked after, not merely when he first becomes the owner of his car, but as long as he possesses it.

Officials of the York Motor Car Company, of York, Pa., were well represented in the recent endurance run of the Qua-

ker City Motor Club of Philadelphia. Aside from the four cars entered and which secured second honors in two classes, Sales Manager H. R. Averill was an observer in the new Philadelphia-built Parkin car; Treasurer R. L. Stevenson acted in the same capacity in a Columbia, and General Manager James A. Kline alternated at the wheel of the 4-40 Pullman entry with Bob Morton.

A patent has been granted the Empire Automobile Tire Company, of Trenton, N. J., on a new electric wire for automobile service. The Empire secondary wire is covered with a rubber stock designed to resist high voltage, the stock being covered with braid and over the braid being placed an oilproof rubber stock. Two braided jackets are placed on the outside. A primary wire made by the Empire company is also insulated with oilproof rubber and finished with two braided jackets.

"It may be well, perhaps, here to state that along the line of progressive improvements we reserve the right to make changes in the construction of Lozier cars at any time, and in such a manner, as, in our opinion, will result in their betterment, it having always been a part of the Lozier policy to discard whatever we feel we have improved upon, and to put into immediate practice any device we have newly perfected, rather than hold it over for embodiment in a later model." The foregoing extract from the Lozier catalogue in explanation of this firm's policy speaks for itself.

Northwest Canada as a market for American automobiles is looming large, according to J. F. McLain, western sales representative of the Franklin Company, Syracuse, N. Y. Mr. McLain states that contracts for the coming season are twice as large as those for the year just past in the territories centering in Calgary and Victoria. In spite of the duty of 35 per cent., the prospects for business are said to be much better than in the Seattle and Portland districts of the United States. A number of ranch owners in the Calgary-Edmonton district are said to be owners of six-cylinder Franklins.

NEW AGENCIES ESTABLISHED.

The Logan Construction Company has just placed its "dealership" for Cuyahoga County with the Southern Motor Truck Company, of Cleveland, O. The latter company has offices in the Citizens' Building, and a large garage at 6410-6414 Detroit avenue, and will handle the full line of Logan cars.

The Lozier cars will in future be handled by the Co-operative Motor Car Company, of Buffalo, N. Y., in that city. This firm is also the agent for the Stevens-Duryea and the Corbin lines. The Newburg Automobile Company has taken the Lozier agency in Newburg, N. Y.

Under the supervision of Lucius S. Tyler, of the Boston office, and the local management of Melvin E. Dixon, the Maxwell company has just established a new sales agency at 84 Mechanic street, Worcester, Mass. The large salesroom

has been attractively fitted up, and an entire line of the new models is on exhibition.

PERSONAL TRADE MENTION.

The death is announced at Amesbury, Mass., of William E. Biddle, president and treasurer of the Biddle & Smart Company, aluminum body builders.

Lee Counselman has accepted the position of sales manager with the E. R. Thomas Detroit Company. He was for seven years with the National Cash Register Company as publicity manager.

R. D. Babson has just accepted a position with the automobile department of the Whitlock Coil Pipe Company, Hartford, Conn., entering upon his new duties on the first of the year.

E. L. DeCamp, formerly connected with the New York office of the Packard Motor Car Company, has been appointed representative of Continental tire interests on the Pacific coast, with headquarters at San Francisco.

Since the first of the new year, B. C. Swinehart, vice-president of the Swinehart Clincher Tire & Rubber Company, Akron, O., has made his headquarters at the Chicago office, 1231 Michigan avenue, where he will continue to look after the western trade in the interests of his firm.

Fearing that he would never hear the end of the leap year joke if he postponed his nuptials after the first of the year, J. G. Sterling, chief engineer of the F. B. Stearns Company, Cleveland, O., who had originally planned to get married next spring, accordingly honored the final day of the old year by having the ceremony performed.

W. W. Burke, formerly manager of the New York branch of the Electric Vehicle Company, has been appointed manager of the New York branch of the Mora Motor Car Company, and will open a salesroom at the southeast corner of Broadway and Fifty-second street as soon as the premises can be made ready.

Charles H. Rockwell, who was, until recently, advertising manager for the National Cash Register Company, has been appointed assistant sales manager of the H. H. Franklin Manufacturing Company, with headquarters at Syracuse. Mr. Rockwell has had considerable experience in the automobile business, having been advertising manager with Autocar Company, and prior to that assistant sales manager of the Haynes Automobile Company, Kokomo, Ind. He will be associated with F. R. Bump, who has charge of the Franklin sales organization. H. G. Kilbourne and J. E. Sangster have been appointed manager and assistant manager, respectively, of the Franklin Automobile Company in Boston, assuming charge on the first of the year. Mr. Kilbourne is a mechanical engineer, and has had a long and varied experience as a salesman, having been associated part of the time with Mr. Sangster, who was his assistant. C. E. Wheeler, formerly in charge of the Boston, remains with the company in another capacity.

INFORMATION FOR AUTO USERS

Ross Steering Gears.—One of the commonest defects of the average steering gear is the fact that it wears in the straight ahead position to such an extent that when adjustments are made to compensate for this it binds at the end positions. The Ross Gear & Tool Company, Lafayette, Ind., has made a special study of this matter and as a result has brought out a new type of steering gear. It is known as the Model B.A., and a part sectional view of its essentials is shown by the accompanying illustration, Fig. 1. This steering gear is of the tubular type and has been designed

ROSS GEAR ESSENTIALS, TYPE BA.

with such a liberal amount of contact surface that the wear is not only reduced to a minimum, but is so distributed that taking up for play in the straight ahead position does not cause binding when the wheel is turned to either extreme. It is constructed to meet the demand of both touring car and truck service, in which an absolute back-lock is required. As shown by the drawing, the steering arm is given a sidewise motion. It can be put on the squared end of the shaft shown, where controls are desired through the column, or it can be made all in one piece with the shaft, which in that instance would be solid, and the controls would be put on the outside. The internal controls are op-

SECTIONAL VIEW OF TYPE BC.

erated by the usual small hand levers on a sector over the wheel, but which does not rotate with it. For light cars the same makers specialize their type B.C., a sectional view of which is shown by Fig. 2, and they also make other types, such as spiral and disc steering gears, beside a line of universal joints and bevel gears, the latter being planned to makers' specifications.

A Handy Gasoline Gauge.—Some means of readily ascertaining the amount of gasoline in the tank of a car without the aid of a dirty stick stuck in the filler opening, or a lighted match held near it, has long been desired by autoists generally. To supply this demand, the Edmund E. Hans Company, Minneapolis, Minn., has brought out the Hans gasoline gauge, which is a simple and compact instrument adapted to be placed on the dash of a car, and showing the depth in inches and fractions of the gasoline in the tank, with which it is

connected. As its name indicates, it resembles a steam gauge, the pointer, instead of recording pressure, giving the depth of the liquid in the tank. The instrument consists of a float chamber of rectangular brass tubing, of the same depth as the tank. In this tube is a copper float, while surmounting the tube is the dial, as shown by the accompanying illustration. A silk cable attached to the float passes over a drum geared to the spindle, on which the indicating needle is mounted. When installing it on a car, the instrument is placed so that the bottom of the float chamber is half an inch lower than that of the gasoline tank, connection being made from the bottom of the float chamber of the instrument to the feed line from the tank to the carburetor, by means of an ordinary brass "T." It is equally adaptable to pressure systems, as well as to many other uses. Gasoline has no effect on the special braided silk cable used, and the instrument is so simple that the makers guarantee it unconditionally for one year. They have recently opened an eastern branch office at 25 West Forty-second street, New York City, which is in charge of Howard Greene.

HANS GASOLINE GAUGE.

Great Scott Carbureter.—The distinctive feature of the carbureter produced by the Scott & Sons Company, Medford, Mass., is the use of two separate needles, one for low speeds and the other for high and intermediate speeds. They are represented in the illustration by *B* and *H*. The high-speed needle is made of steel, tapered and hardened, and passes through the steel bushing *I* into the gasoline passage *J*, the bushing being cupped for the purpose of retaining a priming charge to start the motor. *C* is the high-speed adjustment. *K* the air adjustment, *A* the throttle, and *L* the float adjustment. At low speeds the

SECTION OF GREAT SCOTT CARBURETER.

passage *D* supplies all the air that is required by the motor without lifting the air valve *E*. At intermediate and high speeds this passage is not sufficient; consequently the air valve *E* is lifted by the vacuum created by the motor until sufficient air is obtained. The high-speed needle *H* he-

ing tapered and attached to the air valve *E*, this latter moves up and down with it; and as the taper of the needle is proportioned to harmonize with the area created by the lifting of the air valve, an increased volume of air is always supplied with an increased amount of gasoline. It is claimed that the Great Scott carbureter gives a perfect mixture at all speeds, that it gives more power and speed, and is economical of gasoline.

Tools for Automobilst and Repair Man.—Some of the most attractive lines in the wide range of tools for automobilists manufactured by the Mound Tool & Scraper Company, St. Louis, Mo., are now put up in special strongly constructed polished wood cases. Among them is a case of 20 tools, gotten up for use

MOUND SET OF 20 TOOLS.

in auto repair work, comprising various chisels, scraping tools, rivet punches, nail set and drift. Another useful line is a case of six scraping tools of assorted sizes from 6 to 10 inches, the

MOUND SET OF SCRAPING TOOLS.

scrapers being made of best tool steel, carefully forged, tempered and hollow ground. A series of carbon scrapers has been designed for removing soot from the top of a piston without taking off

MOUND CARBON SCRAPERS.

the cylinder head. They are of 1-4 inch crucible steel, hand forged, and polished finish. Among the other articles are noticed cotter pin extractors, offset screw-drivers, improved all-metal screw-drivers, chisels, and three-quarter scrapers, all of which have been specially designed and manufactured with a view to meeting the particular requirements of the automobilist, as it is a matter of common knowledge that standard tools frequently fall far short of being what is needed to accomplish the many small repairs about an automobile.

THE AUTOMOBILE

DOWN through Poitou, in mid-France, and on across the barren Landes runs the great Route d'Espagne, along which journeyed Louis XIV when he was on his way to wed the Spanish Infanta Marie-Thérèse at Saint Jean de Luz in 1660, and along which many a stirring automobile race has since been held. The last of racing or touring tests over unguarded roads was held here only last summer, when five lost their lives in the Coupe de la Presse touring competition, which degenerated into a race, and the Government stepped in and stopped it. It was the same fate which befell those of the famous Paris-Madrid race of

1903, when Gabriel's Mors, from Paris to Bordeaux, first broke the sixty-mile-an-hour record for travel by road.

As one has made his way gently or rapidly, down through that marvellously opulent region of mid-France south of the Loire, and has left Tours, Chateauroux, and Poitiers behind, a while new panorama of scenic sensations awaits him. At Libourne, thirty kilometres north of Bordeaux, he has crossed the imaginary line which limits the frontiers of the north and the south, the region of the *vins du table* and the *vins de marque*. From thence his way lies through a country entirely southern in aspect, where, if the leaves do fall from the trees once with the round of the seasons, there is a mildness of at-

mosphere and an easy manner of living very different from that which holds good in the northern parts of France.

Bordeaux is the obvious and natural stopping place on the way south, and since a wide detour has to be made just south of here, to avoid the awful granite blocks of the times of the Henris and the Louis which still project above ground for a matter of some eighty kilometres, the city may well be reckoned the actual gateway to the much vaunted Côte d'Argent.

Now almost as celebrated as the Côte d'Azur of the Riviera, this fascinating strip of Atlantic coast-line, lying under the shelter of the western Pyrenees and loping over into Spain, has a winter season of quite six months duration, and indeed what the hotel proprietors and the railway managers call an all year round clientele, for it is one of those regions where it is, relatively, warm

in winter and wuffed by refreshingly cool breezes in summer.

For the six months, from October to May, the elite of all Europe makes gay in the resorts of Biarritz and San Sebastian, and another element takes things easier in Saint Jean De Luz or Cambo.

Automobilists from afar come and go in steady streams all through the year all up and down the Côte d'Argent, over into Spain, and up into the higher valleys of the Pyrenees. There is another group of devotees which makes its headquarters at Pau, but there things are more orthodox and conventional, and there is not the brilliancy and variety of life and atmosphere that is to be had from the cosmopolitanism of Biarritz and the in-

THE APPROACH TO FONTARABIA.

prise and the other a "concession"), "the game," and all the social divertissements of a cosmopolitan whirl of humanity. Added to this are the not important attractions of nature, the sea and sky, a wonderful panoramic background of the purple Pyrenees, and a fascinating melange of men and manners.

The fame of Biarritz is of the epoch of the third Napoleonic era, when the ambitious Eugénie gave it the cachet of her favor and compelled that of her indifferent spouse. It was only, however, when the Russians, the Americans, and the English came—and the automobile, that Biarritz took on its entirely modern aspect. Finally a batch of grand dukes moved over from Cannes, and England's king put in a season here, and the young Alphonso began to vibrate—on an automobile—between here and San Sebastian and the Palace Miramir that all the world and his wife began to turn their thought to this pearl of Atlantic sea-coast resorts.

Biarritz, then, is the objective south of Bordeaux of all up-to-date automobilists, and as an itinerary for getting south the Route d'Espagne, leaving Paris by the Porte Maillot, Suresnes, Versailles, Rambouillet, Chartres, and Chateaudun is a pleasant change from that usually followed down through the Rhone valley. Incidentally, if one is bound for Monte Carlo—and

timacy of the rolling won't be headed off by counter attractions—there is a matter of billows of the Gulf of Gascony as they pile upon that strip of coastline bight, extending from the mouth of the Gironde around the Santander in Spain, and so dreaded of sailormen.

Biarritz, in a way, is like any other great European watering place, crowded with great hotels, the inevitable Casino (two of them here, one a municipal enter-

prise and the other a "concession"), "the game," and all the social divertissements of a cosmopolitan whirl of humanity. Added to this are the not important attractions of nature, the sea and sky, a wonderful panoramic background of the purple Pyrenees, and a fascinating melange of men and manners.

The fame of Biarritz is of the epoch of the third Napoleonic era, when the ambitious Eugénie gave it the cachet of her favor and compelled that of her indifferent spouse. It was only, however, when the Russians, the Americans, and the English came—and the automobile, that Biarritz took on its entirely modern aspect. Finally a batch of grand dukes moved over from Cannes, and England's king put in a season here, and the young Alphonso began to vibrate—on an automobile—between here and San Sebastian and the Palace Miramir that all the world and his wife began to turn their thought to this pearl of Atlantic sea-coast resorts.

The roads of the Landes are bad, and have always been bad, because there is no sufficient quantity of decent road-making material at hand to make them better. Things are improving and road-builders are learning more and more every day, though one does wonder, when he comes to think of it, if we have advanced so much over the Romans after all.

At any rate road-building was costly and difficult here in the Landes; it was even so when the Kings of Navarre paved that awful strip of road south of Bazas on the direct route to Bayonne, which remains to-day as the supreme terror of the automobilists in France.

Bayonne One of France's Historic Old Towns.

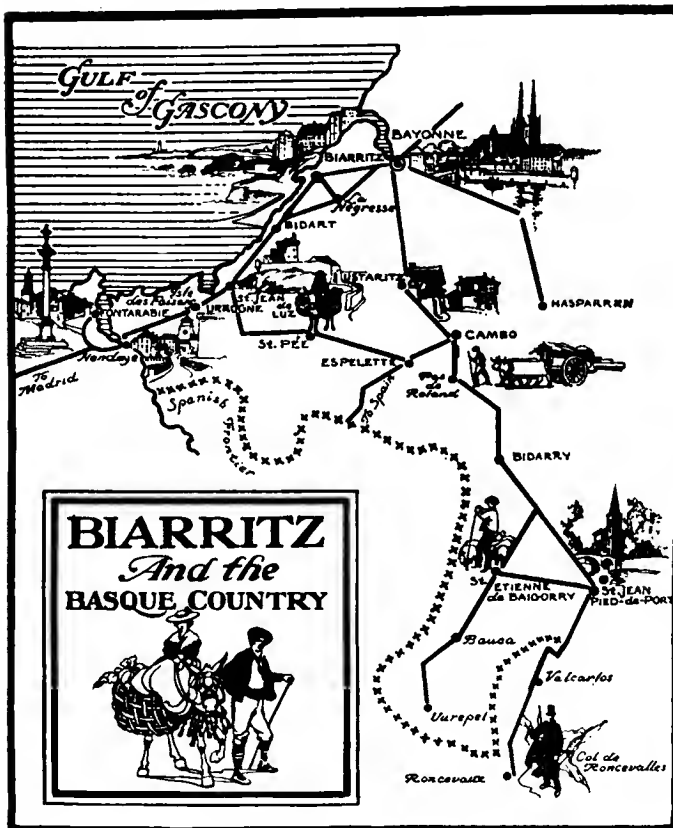

Bayonne is one of the most historic and attractive old towns of France, though it has a busy work-a-day temperament, with not a suspicion of the characteristics of Biarritz, its mondaine neighbor. The artist, the genuine vagabond tourist, and some others will like Bayonne immensely. The hotels are good, but frankly of the quality known as commercial, but they give you the real things of the country to eat and good pure wine to drink and charge you very little for it—and nothing for garaging your automobile. At Biarritz, and in all resorts, one eats imitation Parisian plats, drinks poorer wine—but with an etiquette on the bottle—and pays seventeen prices for everything. *Chacun à son goût!*

The Grand Hotel de Commerce at Bayonne, or the less expensive but better and much more picturesquely named Panier-Fleuri will do you very well, and you will eat of the famous jambon de Bayonne and wonder why you have not heard of these pork products before. The folk of Bayonne don't know how to advertise, that's all; those of Chicago do!

Biarritz is thirteen kilometers from Bayonne; its charms are many; they are all written up in the guide-books, the hotel advertisements and the railway time-tables; you go there and you take your choice of the great palace hotels, and you play the "little horses" for all you are worth—or at least more than you can afford—and you take tea on the terrace and cocktails in the American bar—which is usually presided over by a German named Heinrich, and anything else that you like that you might do so well in New York, Paris, or Vienna—all the distracting things which amuse a blaze whirl. Biarritz is an admirable centre for "something different" in automobile excursions, some of which are set forth in the accompanying sketch-map.

In the Country of the Basques.

One launches out on his automobile from Biarritz and within a few turns of the wheels is in the midst of the country of the Basques, a well-defined region which extends over into Spain.

FORTIFICATION GATEWAYS OF OLD BAYONNE.

but whose people—whether in France or Spain—speak the same unique tongue, which resembles nothing else coming from the mouth of man. The *béret* of the French Basque is blue, and that of his Spanish brother red; that's the only difference; they both look as though they had stepped out of a comic-opera chorus—though the women are rather more beautiful and for the most part not so aged—and they have a cloak thrown over their shoulders and rope-soled shoes—which they call *espadrilles*—on their feet.

The Basques still obey the laws, speak the tongue, and perform the acts and rites of their ancient civilization—that which perhaps existed three thousand years gone by. In the high Pyrenees, behind their mountain ramparts, they have found the way to resist the march of progress and of many of the jealousies and crimes attendant upon an advanced civilization. A wonderful people, truly!

Leaving Biarritz, on the Route d'Espagne, within eight or ten kilometers one passes the two typical little Basque towns of Bidart and Guetary, with nothing much to remark save the severe primitiveness and cleanliness of the white-walled and red-roofed houses, the charming background panoramas, the off-shore fishing-boats, and the rolling breakers of the sea.

At Saint Jean de Luz, not more than a dozen kilometers from Biarritz, one comes upon something a good deal more characteristic of the *pays* than anything to be seen or experienced in the resort of rank and fashion left behind. The town has developed into a resort, too, of a considerable magnitude, but it has not become fashionable, and hence has some saving grace left. It was the former capital of the country of the French Basques, or at least shared that honor with Saint Jean Pied de Port farther inland. Eleanore of Guyenne brought the town as a part of her marriage dot to Henry Plantagenet in the twelfth century, and reminders of that time are not wanting in this decaying little seaport to-day. History lent a still greater luster to the little Basque metropolis when Louis XIV came here to meet and marry the Spanish princess who was to be his bride in 1660. Then came the decadence. The Basques had always been great whale fishers, and they followed the whales, which had hitherto been numerous in the home waters, to the southern seas, to the Newfoundland Banks and to all ends of the globe, when, suddenly, these hardy mariners developed a roving spirit and a desire to emigrate like the sunny Sicilians and fighting Patrick of to-day. To-day there are more Basques in the Argentine than there are in France, and they are still on the go.

On Towards the Spanish Frontier.

On towards the Spanish frontier another half a dozen kilometers brings one to Urrugune, famous principally because of its clock-tower and some verses which Victor Hugo wrote about it. The tower still bears the following bloodthirsty inscription,

but what the exact significance of it is no one seems to know: "Vulnerat Omnes, Ultima Necat." The town, as might be expected, is thoroughly Basque in every crazy, crooked street, and though it has three thousand inhabitants not one of them cares a jot what is happening at Paris and much less what is going on between America and Japan; indeed the only city in America of which they have ever heard is Buenos Ayres, and that only because one or another of them has a relative there.

To Hendaye and the frontier is only another *petit pas*, six or seven kilometers. Hendaye, as a matter of fact, is the railway frontier station; the frontier station by road is at Behobie, at the French end of the Pont International, where, if you are going into Spain, to Fontarabia and San Sebastian, you will have to arrange your custom formalities. These look formidable when set out on the poster tacked up in the Bureau, but they are really quite simple. If you anticipate any trouble the local garage proprietor at Behobie or Saint Jean de Luz will—for a price—relieve you of all annoyance, and may perhaps be induced to guarantee the duties if you are only going across to San Sebastian for a day or two. This is worth looking into. The name of this amiable Frenchman is Claverie, and his address is simply Behobie or Saint Jean de Luz. The Spanish government holds back six pesetas of the sum you advance for customs duties, to pay for the wear and tear on Spanish roads, but since their highways in the immediate vicinity of the frontier are as good as they are across the border no one will quarrel. The farther inland into Spain you go the worse they get, though.

Fontarabia lies four kilometers towards the coast from Irun, the first Spanish town after you have crossed the bridge. Here no one knows French—not even your kind—and is obliged himself to have an interpreter to make himself understood if he takes a ten-mile journey into France and accosts a *gendarme* by the way. With the indigenous Basque the case is different. A Basque living fifty miles over the border in either country talks

UNCLASSIFIED—BUT GOOD—ROAD IN THE BASQUE COUNTRY.

the same speech as his alien brother, though one knows not French nor the other Spanish. The Basques may be a dying race, but they are holding on to the remnants of their mother tongue with a remarkable pertinacity.

Irun is nothing for the tourist; Fontarabia is much. The latter is a mossy, decaying bit of medievalism living to-day and as notable an example as one will find in Europe close by a great international thoroughfare. Fontarabia is very, very unworldly. It has nine thousand inhabitants, but it doesn't look it, and most of them are dozing away in the shadow of grim-barred windowed and red-roofed Renaissance houses in utter indifference that certain progressive ones are trying to create a resort.

San Sebastian is twenty kilometers beyond Irun. It is the fashionable watering-place of Spain. One can get but little information in France concerning it, but the Spaniards themselves think that it overshadows Biarritz by far. Well, perhaps it does! One is free to take his choice. Anyway there are great hotels here, and the cuisine is French, and accordingly better than if it were Spanish, and there are fine esplanades and shady promenades and bullfights and gambling. Anything you like!

In the Heart of the Western Pyrenees.

Doubling back to Saint Jean de Luz and then turning sharp to the right, one follows the valley of the Nivelle as it flows down from its cradle in the upper Pyrenees. It is the very ideal of a swift-flowing little mountain river and the road is delightful from more points of view than one. All the while one is burrowing into the heart of the Western Pyrenees, the great purple curtain always at a respectable distance, but still so near that one almost feels as if he were already mountain climbing with his automobile. The road is rising all the time, but the slope is so gentle that it is almost imperceptible.

Saint Pée is the first townlet of note on this little byroad. It is thoroughly of another world and era, as is suggested by the ruins of its fifteenth century chateau, where legend has placed sorceries and crimes unspeakable as the chief events which passed within its walls. To-day the little town sleeps its time away, and not a Basque among its inhabitants but what believes that he is as his forefathers.

One of the half dozen practicable carriage roads across the Pyrenees leads into Spain nearby, and if one is so minded he can keep on to Pampelune, the old capital of Spanish Navarre, a mountain town of thirty thousand folk almost as dead as Saint Pée, but not quite. Here the *hotels* and *auberges* have become *posadas*, and the populace spends most of its waking hours in doing nothing save dancing and smoking very black tobacco twisted into slim papillotes. Pampelune is famous for its bull fights and its cathedral, with the bulk of local interest lying with the bull-ring, where the real, unadulterated, simon-pure, non-society bull fight of classic quality takes place as often as the exploiter of the plaza-toro can get an audience together.

One can make the round from Saint Pée to Pampelune and back again into France by another road to Saint Jean Pied de Port, in all perhaps sixty kilometers. The only difficulty will be the arranging of the customs duties, which will have to be done at either Saint Jean de Luz or Saint Jean Pied de Port.

Omitting this little detour into Spain, the road still continues a gentle rise and fall, via Espalette, a Basque market town, where three or four delightfully simple but excellent little hotels will cater for your hunger and fatigue.

From Espalette into the valley of the Nive, a more ambitious sister of the Nivelle, is scarce ten kilometers. One strikes the shores of the Nive at the very spot where the Paladin Roland clove a pathway in the rocky wall which barred his progress when he was fighting for Charlemagne in the eighth century. You need not believe the tale if you don't wish to, but the roads run through a cleft in the rock just the same, and the cleft was made either by the hand of man or God at some period posterior to the time when the rocks were dumped down here.

The road by the Nive continues straight on for thirty-three kilometers to Saint Jean Pied de Port, the metropolis of the

inland Basque country, and the rival of Saint Jean de Luz for political honors in times past. The contrast between the two Saint Jeans is very great. At the seaside ville there is an air of antiquity well blended with that of modernity, but at the mountain town all is medieval, even to-day. Its very name, Saint Jean Pied de Port, indicates that it was an advance post of warring times, when the frontier roads in and out of France were even more closely guarded than they are to-day.

Saint Jean Pied de Port's old houses, its frowning citadelle—still a frowning fortress ready garrisoned for anything likely to happen—and its old gates and bridges are other attractions which place the little Pyrenean town in a class quite by itself. The hotels, too, particularly the Hotel Appeteguy—which you had best write down and not try to pronounce when asking your way—being particularly so.

The classic excursion to be made from Saint Jean Pied de Port is up to the crest of the Pyrenees, to the famous Col de Roncevaux, thirty kilometers, and all up hill. It is quite worth the doing, though again there are the annoying customs formalities to be gone through, as shortly after leaving the town the highway enters upon Spanish territory. Perhaps the mechanician at Saint Jean will have a suggestion to make. Better ask him. If the thing doesn't look otherwise practical why hire a hack, which you may do for a matter of fifty francs, but be sure you make the arrangement "*tout compris*," otherwise you will have surprises sprung upon you—*every little while*.

Where Roland Met His Defeat.

The pass is reached—the col or port, according as to whether you ask a Frenchman or a Spaniard—at thirty kilometers, and two kilometers farther on is Roncevaux itself, revered in the memories of our school days when we had to declaim the famous Song of Roland without having the slightest idea of what it was all about, or whether its *locale* ever existed or not. This is the place; here Roland met defeat and Charlemagne's army beat a quick retreat, and all because some credulous Basques would not understand and rolled great boulders down upon them from above.

The great convent of Roncevaux, perched high on the mountain top, has played its part, too, in the history and romance of France and Spain. After Jerusalem, Rome and Saint James of Compestello, Roncevaux comes next as a place of pious pilgrimage. It suffices to ring the bell at the great gate when a long-robed brother will put in an appearance and do the honors.

Facing north again there is that long down-hill road, thirty odd kilometers to Saint Jean Pied de Port and another thirty odd to Cambo, an incipient and altogether lovely little resort where one may take his ease and rest, and get in touch with civilization in the shape of the New York-Paris *Herald* and yellow-backed novels. Cambo is not yet spoiled, but it is getting that way. It has two thousand inhabitants, five hotels, and no end of villas and furnished apartments. This is enough to weigh down the charms of paradise. Still Cambo is really a delightful green and white little town bedded snugly on the banks of the Nive, a very clean, well-ordered little town, and not at all "rapid," nor even conventional. The Etablissement de Bains is the chief attraction and amusement—for those who can get pleasure out of bathing and talking about one's imaginary ills to the house doctor. The automobilist bathes to a purpose, but most of the frequenters of the *villes d'eau* take baths because they don't know what else to do. Actually the popular fame of Campo to-day is due to the presence of Edmond Rostand. He came after he had made his fame with the rollicking *Cyran*, and now the crowds come to worship at the very modern literary shrine offered by his house and grounds.

Back from Cambo to Biarritz and Bayonne is only a good twenty kilometers, the sea air blowing fresh off the Bay of Biscay the while and cooling down the whole region in a way that makes it delightful at any time of the year. Yes, Biarritz is a great resort and its attractions are many, but those of the town, the plage, the great hotels or "*les jeux*," are not the greatest.

HENRY FARMAN'S AEROPLANE PREPARING FOR A PRACTICE FLIGHT AT THE ISSY-LES-MOULINEAUX DRILL GROUND NEAR PARIS.

FARMAN WINS \$10,000 PRIZE FOR KILOMETER FLIGHT

PARIS, Jan. 13.—To Henry Farman, ex-racing cyclist and pioneer automobilist, belongs the honor of first covering a circular kilometer with a flying machine, unsustained by any gas bag, in the presence of experts and under the eyes of the public. Farman this morning won the \$10,000 prize offered in October, 1904, by Messrs. Archdeacon and Deutsch de La Meurthe for the first aeroplane covering a circle of not less than one kilometer without touching ground. His victory was clear and decisive, left not a shadow of a doubt and proved to the world that the problem of aerial navigation by machines of the heavier-than-the-air type has been satisfactorily solved.

On the Issy-les-Moulineaux drill ground, just outside the city walls, Farman made two flights on Saturday morning of so successful a nature that he officially engaged himself for the Deutsch-Archdeacon prize this morning and convoked the presence of the Aero Club committee.

At 9:30 of a clear January morning in a still atmosphere and under a sun just sufficiently warm to drive away the early mists, a course was measured out by the Aero Club officials, and preparations made for holding the world's first successful heavier-than-air flying machine contest. A score of prominent aeronauts, among them Santos-Dumont, Bleriot, Comte de la Vaulx and Kapferer had gathered on the ground to watch the attempted record flight. The public, driven off the open field by officious policemen, climbed onto the fortifications, about five hundred strong, where they obtained a better view of the proceedings than the privileged ones on the ground below.

At ten o'clock the eight-cylinder Antoinette motor was cranked, Farman mounted into his seat, and a preliminary run over the ground was commenced. When a hundred yards had been covered and the machine was going 35 miles an hour, Farman lifted the head of his aeroplane and rose gracefully

into the air, passing the starting mark at a height of 25 feet from the ground. With no other sound than the noise of the engine and the whir of the big machine. Farman rushed down the straightaway, gradually turning, then swept round the flag on an even keel and in magnificent style. As he straightened out and came down the straight stretch towards the starting point, a realization of victory came over the public and a rousing cheer went up from the crowds on the fortifications. Farman swept past the flags denoting the start and finish at a height of fifteen feet from the ground, cut out his ignition and descended gracefully almost at the feet of the little group of officials. No one asked if he had won—it was patent to all. Accounting for the curves, Farman had actually covered 1,300 meters, as subsequent measurement proved.

Kapferer, who had been holding the watch, yelled out: "One minute twenty-eight seconds." the time of the flight; then the Gallic temperament let itself loose, Farman was torn from his machine, carried in triumph, kissed on both cheeks, and cheered again and again. The only person on the ground who maintained his *sang froid* was the hero of the hour. No victory was more deserved than that of Henry Farman. Since receiving the machine built for him by the Voisin Freres, he has perseveringly and persistently trained him-

self to fly, modifying the machine where necessary, but always declaring that as much depended on the man as the apparatus.

Severity of Kilometer Test.

PARIS, Jan. 6.—For several months fifty thousand francs in crisp bank notes have been waiting to be handed over for one minute's work in the air, without a person on the face of the globe being able to lay claim to them. Flying a kilometer in a circle, so glibly spoken of by everybody interested in aeronautics, is a more difficult problem than is generally supposed, and means far more

FARMAN AND HIS LIGHT WEIGHT ANTOINETTE ENGINE.

than leaving the earth and dropping down again at some point 1,093 yards from the starting line. Half a dozen machines, of as many different types, but all heavier than air, have succeeded in doing this without being entitled to special mention, much less a ten thousand dollar prize.

When M. Archdeacon's cash has been won, as it certainly will be at no very distant date, it will prove that a new and practical era in aerial locomotion has been inaugurated for the initial difficulties connected with sustentation, steering and alighting will have been solved. What the contest committee of the Aero Club of France, which has charge of the test, expects of the aeronaut is shown by the accompanying sketch. The aeronaut having been given as long a run as he desires, must leave the ground at the line *AB*, swing round the flag *C*, situated 500 meters ahead, and return to the starting point without having touched earth. Further, he must come down at the exact point from which he left the ground, or if unable to do this must drop some object in his passage which shall fall within a circle of 26 yards around that point. The starting line *AB* is not a fixed one, but a flying line, if one may use such an expression, noted by the referees called to watch the test. Likewise the flag *C* only exists after the test has been made, the aeronaut being obliged therefore to judge the distance covered before attempting to make the turn, the jury noting the point farthest away from the starting line and measuring afterwards.

The chief difficulty of the test is the turn after covering half the distance. Naturally the machines keep as close to the surface of the earth as possible, to guard against accidents, but when low there is constant danger of one of the wheels touching as the machine heels over and causing disqualification. Lack of equilibrium, too, is frequently a cause of failure, a machine which can travel successfully on the straight being incapable of being driven in a circle.

A \$20,000 Bet.

Increased interest in aeroplane experiments has been aroused by a bet of \$20,000 a side between Vincenzo Florio, donator of the Florio Cup, and his countryman, M. Vonwiller, who finished second to Lieutenant Lahm in the Gordon Bennett balloon contest. The one to win the prize will be the aeronaut who first succeeds in flying around the oval-shaped Palermo racing track, 1,640 yards in length.

The bet is open until the end of December, 1908; if both accomplish the feat the one who makes the best time will be the victor. It is the intention of the two bettors to employ Italian engineers only for the construction of their machines. M. Archdeacon, donator of the \$50,000 prize, has suggested that instead of taking the stakes themselves the two Italians should hand them over for the development of aeronautics, by organizing a 15-mile race for heavier-than-air machines, with a cash prize of \$20,000. He would have the race run on a closed aerial circuit, formed by two captive balloons, one kilometer apart.

AFTERMATH OF QUAKER CITY ENDURANCE.

PHILADELPHIA, Jan. 13.—Since the endurance run of the Quaker City Motor Club, the honors in which were finally awarded to the White, the wearing of chips on shoulders by agency and branch managers here is quite the usual thing. Challenges are flying; the contest committee has "explained"; resignations from the Quaker City Motor Club have been sent in; even ordinary observers have invaded the columns of the local dailies to explain just why they marked the penalties on the cars to which they were assigned. All of which goes to show that in promoting any competitive affair it is the height of prudence to see that in naming the important committees an effort should be made to eliminate the trade end.

In an organization like the Quaker City Motor Club, however, where nearly all the leading lights and workers are tradesmen, such a task is decidedly difficult. A similar state of affairs probably obtains in similar organizations throughout the country. Hence the imperative need of the national body taking some part in the management of future affairs.

While the technical committee in the Quakers' run were honest and above-board, and undoubtedly handled a ticklish job with judicial calmness and fairness, the closeness of the contest gave some of the contestants a chance to insinuate that friendship for certain of the contenders had swayed their judgment. The White protests against allowing the Peerless and Studebaker to finish clean in the original contest, which were written in the heat of battle, were strongly worded, and stirred things up more. The Peerless reply kept the pot boiling. Then the Studebakers challenged after being beaten out in the final, and the Whites replied that they didn't care to accept private challenges from rivals whom they had defeated publicly. Later the Pullmanites asked the Studebakers to have it out over the course, the former claiming minor troubles in the main event put them out of it. The latter have not as yet accepted the challenge.

Some comment having been indulged in as to the inability of air-cooled cars to cover such a hard course on schedule time, President Percy Neal, of the Quaker City Automobile Company, will send a Franklin over the 172 miles of the course to-day, to-morrow, and Wednesday, and between times will keep the engine running all night in the garage.

Meanwhile many of the contestants have found crumbs of comfort in the performances of their cars, and are telling the public about them in the automobile columns. Quite a number of sales have resulted directly from these performances, and there is a general demand for other similar contests here. But it is admitted on all sides that some changes must be made in the methods of naming the committees.

The final report of the club's technical committee, based upon an examination of the cars after the run-off tie, showed a one-point penalization for the White; nine points for the Peerless, and 27 points for the Studebaker.

Lozier Explains About Its One-Point Penalty.

Editor THE AUTOMOBILE:

In your Issue of January 9, under the table of general results showing the penalties in the Quaker City endurance run, the Lozier car is scheduled with a penalty of two points. Will you be kind enough to publish this correction, as the penalty against the Lozier in the entire run was only one point, this being caused by a momentary stalling of the engine. The rules stated that "a car shall be penalized one point for every one-minute stop," and as the motor was only stopped about ten seconds, the committee placed a penalty of only one point. With this exception the Lozier car went through the run with a perfect mechanical score, making every control, going and coming, on time.

Furthermore, the schedule contains a reference mark: "Not examined by technical committee." This also is an error, as the car passed the technical committee's examination and was declared mechanically perfect.

LOZIER MOTOR COMPANY,
New York City. C. A. Emise, Manager Publicity Department.

PROGRESS IN PLANS FOR BRIARCLIFF TROPHY

SKIRTING MT. KISCO—EXCELLENT GOING.

LONG, STRAIGHT STRETCH NEAR BEDFORD.

OILING THE ROADS NEAR BRIARCLIFF

MILLWOOD, WHERE A TRAP EXISTED.

INTERVIEWED in New York City at noon on Tuesday, T. F. Moore, secretary of the committee conducting the Briarcliff Trophy race, of which Robert Lee Morrell is the chairman, supplied the following particulars on the stock chassis contest scheduled over a course in Westchester County for April 24:

"At the present moment we have twelve paid-up entries from these firms," producing a list on which was written Hol-Tan, Isotta, Lozier (2), Renault, Fiat, Stearns (3), Panhard, Allen-Kingston, Simplex. "These are in addition to the Rainier entry made by Mrs. Cuneo, for which we have received this check (the check was produced), and twelve other firms that have assured us they will make engagements. We expect to receive these entries before Wednesday night, the closing date, and they will give us Isotta, Matheson, Fiat, Garford, C. G. V., Dragon, Chadwick, Pope-Hartford, Studebaker (2), Pennsylvania and Belden.

"A special meeting will have to decide on the acceptance of Mrs. Cuneo's entry and the extension of date for receiving engagements. It is very probable that the former will be refused and the latter agreed upon, a few days' grace being accorded to allow others to put in cars.

"The rules of the race," explained Mr. Moore, "call for a \$1,000 entrance fee per car, half of which must be paid when entry is made. When all legitimate expenses have been met each entrant will have returned to him either \$500 or such proportion as remains to be distributed. When full return has been made to the entrants the balance will be distributed in the townships on the course for road improvements. We have placed our entrance fee at \$1,000 on the insistence of Mr. Morrell, to be assured of success; in other words, we have underwritten it to that amount. We are not speculating on grand stand receipts to meet expenses.

"How will the course be protected? I cannot say yet. Probably the grand stand will be on a three-mile stretch over which we have a complete right of way for each side of the road. We shall have 300 local men with power of arrest and will take into the county 900 guards, who will have to rely on moral suasion for their force, but these will be full grown men over 21 years of age, and not mere boys, as was the case on Long Island.

"Yes, there are railroad crossings on the course; there are four of them. It will be impossible to stop the train service, but as the donator of the cup and the chairman of the line are very closely connected, we shall have every facility for flagging the trains if a car is approaching. It is for this work that our three hundred guards will be principally employed."

CROSSING IN LIMITS OF BRIARCLIFF.

NEAR MOUNT KISCO, ANOTHER CROSSING.

ALL TECHNICAL CONDITIONS OUT FOR THE GRAND PRIX

PARIS, Jan. 10.—Taking as a basis the international regulations adopted by all European automobile clubs at Ostend, by which a four-cylinder engine should not exceed 155 millimeters bore, Secretary A. Sautin, of the Racing Board, has now announced conditions for all classes of machines taking part in the Grand Prix, to be held early in July. Makers wishing to enter any other than four-cylinder machines are now informed exactly what conditions must be met, whether their engine be a one-lunger or an eight-cylinder. It is not likely, however, that uniformity will be broken, except possibly by one six-cylinder car, makers being of the opinion that the four-cylinder type is most suitable for racing, most of them, indeed, having their plans already well advanced for engines of this class. The official notice reads as follows:

"All cars taking part in the Grand Prix of the A. C. F. must have a four-cylinder engine of 155 millimeters bore (6.102 inches) or its equivalent in useful surface, namely, 75476.8 square millimeters. This would give:

For a single-cylinder engine.....	310 mm. bore
For a two-cylinder engine.....	219 mm. bore
For a three-cylinder engine.....	179 mm. bore
For a four-cylinder engine.....	155 mm. bore
For a six-cylinder engine.....	127 mm. bore
For an eight-cylinder engine.....	110 mm. bore

"Decimals have been excluded in arriving at these figures, and no tolerance will be allowed. Each car in full running order, but without water, gasoline, tools, spare parts, or spart tires, must weigh a minimum of 1,100 kilogrammes (2,450 pounds). Oil in the crank and gearcases will be included in this weight."

As entries at ordinary fees will close on February 15, constructors are of opinion that the choice of a circuit should be made as early as possible. Though Dieppe is a formidable candidate, it is not at all certain that last year's course will be accepted, the township being willing to offer its subsidy only on condition that there be two days' racing, and the club not being disposed to repeat the experiment of 1906. Government permission to hold the race has not yet been obtained, and, although there is little or no danger of a rebuff, Premier Clemenceau being favorably disposed towards automobile racing, most constructors refrain from sending in their engagements until all formalities have been accomplished.

The only activity of the week among racing drivers has been the formal engagement of Rigal, as driver of one of the Bayard-Clément cars. Negotiations have been opened with Gabriel, for several years a constant member of the Dietrich team, to enter the Bayard service. Le Blon is spoken of as the possible third member.

COMPLETE ROUTE PLANNED FOR NEW YORK-PARIS RUN

THE exact route to be followed by the contestants in the 20,000-mile tour from New York to Paris has been announced by the *Paris Matin* and the *New York Times*, sponsors of the event. The journey, nine-tenths of which is on land under the power of the cars alone, and one-tenth by steamer, has been divided into three stages, as follows: (1) Across the United States to the Pacific coast; (2) through Alaska; (3) across Siberia and through Europe to Paris. Considerable changes on the route as at first announced have had to be made owing to the difficulty of traversing Alaska. The competitors will be taken by steamer from San Francisco to Seattle, where trans-shipment will be made to Valdez, no steamboat service being available direct from San Francisco to Alaska. Outside help is necessary at this stage of the journey in order to assure arrival in Alaska before the ice has broken up and the country become a huge morass.

Starting from Times Square about the middle of February, the route will be to Chicago. From this point westward exact route cannot be given, the organizers contenting themselves with naming the towns on the line of march, leaving it to the contestants to reach them as they may think best. The journey over the Rockies and the Wyoming plateau

is not expected to be as difficult in winter as it is in summer, owing to the ground being frozen hard and most of the streams frozen. If there should be heavy snow it would not be more difficult to overcome than summer mud; in fact, to San Francisco there should be comparatively little difficulty.

Arriving at Valdez, Alaska, by steamer, the tourists will penetrate into the interior until they strike the Yukon, which they will follow down to a point from which Nome can be reached. The passage across the Behring Strait will be arranged from Nome City. The landing point in Siberia will be East Cape, where an 11,350-mile run will be made.

Henry Fournier, the ex-racing driver, now Paris agent for Itala cars, announces that he is preparing an Itala for the contest, and asks permission to start it a little later than the others. It is not known who will drive the winner of the Pekin-Paris tour, for Prince Borghese has emphatically declared that he will not take part in the longer run. Two De Dions and one Motobloc are completed and will be certain starters. About a dozen others, among them three or four American cars, are declared to be starters, but there are not very strong evidences of their active preparation for such a severe ordeal.

TARGA FLORIO TO OPEN EUROPEAN RACING

PARIS, Jan. 10.—Nine entries of three cars each from Fiat, Itala and Isotta-Fraschini have been received for the Targa Florio, the opening speed test of the European season. The race is to be held on a 250-mile circuit in Sicily, and is open to cars having a bore between 120 and 130 millimeters for four-cylinder engines, the conditions being practically the same as last year's race. The Chevalier Florio, who is almost entirely responsible for the financing of the event, refused to accept the conditions of the international conference, this race being the only one of importance in Europe on other than the Grand Prix rules.

In addition to the Targa Florio and the King of Italy's

gold medal, the winner of the race will receive \$3,000 in cash, the second \$1,600, third \$800, fourth \$400, and fifth \$200. Entrance fee is fixed at \$200 per car, the limit per firm being four cars. French firms are attracted to the race by the offer of free transportation of their racing cars and drivers from Marseilles to Palermo. Among the drivers engaged are Lancia, Nazarro, Wagner and Minoia.

In addition to the race for the powerful cars, a voiturette speed test will be held on the same course two days before the Targa Florio, the main prize being a handsome silver trophy now held by Sizaire & Naudin. The course is an exceedingly difficult mountainous one.

THE GYROSCOPIC ACTION OF A FLYWHEEL

By ROGER B. WHITMAN.

IT is quite usual to hear some easy reference to "gyroscopic action" during the course of an explanation of the capsize of an automobile, and it is not an uncommon superstition that the revolving flywheel is the seat of a mysterious force that will roll a car over on a turn. After a study of the subject there can be no doubting that there is reason for these beliefs, but an explanation is necessary that the general understanding of the manner in which a car can be affected by the spinning flywheel may conform to the facts. The device known as the "gyroscope" shows the effects of some of the most interesting of natural forces, and while the causes of its evolutions are by no means understood and explained, a study of its movements will

FIG. 1.—Common form of gyroscope with axis of rotation at right angles to that of spinning disk.

illuminate certain phases of the action of an automobile engine.

A gyroscope may be defined as a device intended to illustrate certain properties of spinning bodies, and the toy sold under that name consists of a ring that carries pivots at diametrically opposed points, in which revolves the axle of a heavy wheel or disk. When the disk is spinning, the toy shows a top-like tendency to stand up, or to swing around in a horizontal or inclined plane in apparent defiance of the laws of gravitation. If the ring is held in the fingers with the disk spinning, nothing unusual will be noticed until the hand is moved, when the apparatus will wriggle and twist as if attempting to escape, and will show every evidence of an opposition to the motion.

These are phenomena that are to be explained, but the construction of the gyroscope does not permit of the extended study that is possible when the ring is pivoted to a frame, the axis of rotation given to it being at right angles to that of the spinning disk (See Fig. 1). This frame is not difficult to construct, and the only precaution to take is to have the ring in balance on its pivots. When the disk is set in rapid rotation, and the frame held firmly in the hand, the axis of the disk may be pointing in any direction, but if the holder swings his arm so that the gyroscope is moved in a curved path in a horizontal plane, the ring will move on its pivots so that the axis of the disk becomes vertical. If the arm is swung at the side so that the curved path of the gyroscope is in a vertical plane, the ring will swing to permit the axis of the disk to lie horizontally.

Further experiment and observation will show that when the gyroscope is moved in a curved path, the axis of the spinning disk will tend to assume a position at right angles to the plane in which the curved path lies. Any rotation in a horizontal plane is rotation about a vertical axis, and rotation in a vertical plane is about a horizontal axis. The rule deduced from the action of the gyroscope may therefore be expressed in other terms, viz., the axis of the

spinning disk tends to set itself parallel to the axis of the greater circle in which it is moved.

This property of the gyroscope, as brought out in these experiments, is accompanied by a phenomenon that is even more striking and difficult of explanation, which is the tendency of the ring to invert itself on its pivots. If, when the disk, as seen from above, is revolving anti-clockwise, the gyroscope is moved from left to right, or clockwise, the ring will invert itself in its pivots, so that the side of the disk that then comes uppermost is revolving clockwise. The movement of the gyroscope in the opposite direction will be accompanied by the instant upsetting of the ring, so that the direction of the disk as seen from above again becomes anti-clockwise, to correspond with the movement of the hand. From further trials a second rule governing the action of the gyroscope will be deduced, that the direction of rotation of the disk tends to be the same as that of the greater circle in which the gyroscope is being moved (See Fig. 2). If the frame is removed and the same experiments performed with the ring held in the fingers, the tendency to follow these laws of the gyroscope will be evidenced by the apparent endeavors of the ring to escape from the grasp, and the wriggle and twist that will now be understood as indicative of the struggle of the disk against the restraining fingers to set its axis parallel to the axis of the greater circle, and to have uppermost the face that revolves in the same direction.

The struggle of a restrained gyroscope to follow its laws will have a tendency to keep the restraining structure from the change in position that would alter the direction of its axis of rotation. This is taken advantage of in the apparatus for checking the rolling of a ship in a seaway, the heavy disk spinning at high speed being placed with its axis vertical. The gyroscope by its weight and speed tends to remain with its axis vertical, and opposes any force that tends to alter this position. The ship is thus the object of opposing forces, of which one, the gyroscope, tends to hold it upright, while the other, the pressure of the waves, tends to roll it over. The gyroscope being the stronger of the two, the rolling motion that would alter the position of its axis is suppressed. As the axis of the gyroscope is vertical, and as the turning of the ship in response to its helm is rotation in a

FIG. 2.—Showing direction of rotation of disk tends to that of the greater circle in which gyroscope is being moved.

horizontal plane and about a vertical axis, there is no opposition to a change in the course.

Gyroscopic action is not confined to laboratory apparatus, for it is exhibited by every spinning body, and its effects are shown in boys' tops as well as in the march of the planets about the sun. The flywheel of an automobile engine, being a spinning body, may therefore be expected to exhibit gyro-

scopic tendencies, and that it does so is amply proved by the condition of the flywheel bearing after a few thousand miles' running. It is well understood that this bearing is the first to give out, and it is the usual practice to make it longer than the others in order to render the wear uniform. While there are many causes for the rapid wear of this bearing, a study of the conditions will indicate that gyroscopic action plays a much greater part than is usually supposed. If the comparatively slow rotation of its three-ounce disk can make it practically impossible to move the toy gyroscope with a steady motion, and to prevent jerking, it is only to be expected that a heavy flywheel revolving at high speed will have its effects on the parts that are designed to hold it rigidly in position.

In the most usual construction, the axis of the flywheel is horizontal and longitudinal. A car making a turn moves in a horizontal plane about a vertical axis, which results in the immediate endeavor of the flywheel to place its axis in a vertical position. That it is unable to accomplish this is due to the construction, the flywheel bearing being the chief factor in its restraint. In going from a down to an up grade the car will move in a vertical plane about a horizontal axis, and the flywheel will then endeavor to assume a position in which its axis would be parallel to the axis of the greater circle, a tendency that would result in twisting the crankshaft into a transverse position. Every change in the direction of the car thus results in a strain on the flywheel bearing that is directly due to the endeavors of the flywheel to set the crankshaft on end or to twist it across the car.

The force with which a gyroscope acts increases with the weight of the spinning disk and with its speed, but the greatest effect accompanies the most abrupt effort to alter the position of its axis. Under normal conditions, the weight of the car is sufficient to hold the flywheel bearing to its work of restraining the gyroscopic inclinations of the flywheel, and there is no further effect than the wear. When a car takes a corner at high speed, however, the tendency of the flywheel to up-end the crankshaft will result in a tendency to up-end the car, and the cumulative effect may well be greater than the weight can hold in check. As speed is further increased there will be a critical point at which weight will be overcome, and the gyroscopic action as master of the situation will raise one end or the other of the frame to such an extent that either driving or steering wheels will lose traction. Whether it is the front or rear wheels that will be affected will depend on the direction of the curve and the direction of rotation of the flywheel, for the tendency of the latter will always be to bring uppermost the face that rotates in the direction of the greater circle.

Attempts to explain accidents to racing cars while rounding turns are often based on the assumption that the gyro-

scopic tendency of the flywheel will be to roll the car over, but that this is not the case may be deduced from the fact that a car rolling over sideways will be rotating in a vertical plane and about a horizontal axis, and that as the axis of rotation of the flywheel is horizontal, it will remain in its position rather than tend to change it. The real effect is a tendency for the car to lose its grip on the road, and this will be equally disastrous whether it occurs with the front or the rear wheels. Decreasing the weight on the front wheels will result in the loss of control of direction at a time when steering ability is most necessary, while if the power of the engine is applied against maximum traction at the rear wheels, and the traction is suddenly reduced, the engine will race and the speed of the driving wheels increase. The restoration of traction as the car strikes the tangent will give all of the essentials of a skid, and under such conditions the loss of a tire, which will most clearly be an effect, will be blamed as the cause.

Here, then, is where the danger from gyroscopic action of the flywheel is to be found. The obvious methods of averting it are to keep the speed of the car on curves below the critical point at which the gyroscopic action becomes so great that the weight of the car cannot restrain it, or to take turns in the road with as flat a curve as possible, in order that there may not be too abrupt a change in the direction of the axis of the flywheel. It would of course be possible to nullify the action by gearing in a second flywheel of equal size and weight, but revolving in the opposite direction. Such a construction would reduce the danger of skidding on turns, and in enabling racing drivers to make time on curves instead of losing it would make the additional weight a matter of little consequence, though the action of centrifugal force on the car as a whole also imposes a speed limit on curves that cannot be neglected.

To the reader whose unfamiliarity with gyroscopic action makes him skeptical of this force with which the spinning flywheel is credited, a few minutes of experimenting with a toy gyroscope will be enlightening. A more convincing test is to hold a wheel of any sort, but preferably a bicycle wheel, by the axle close to the hubs, and to try to invert it while it is spinning. As further evidence may be cited the recorded tests of a German torpedo boat one hundred and sixteen feet long and of fifty-six tons displacement, held level in a heavy seaway by an eleven hundred pound disk spinning sixteen hundred revolutions a minute.

While the gyroscope is one of the least-understood of mechanical devices, what is known of it presents undeniable evidence that tire blow-outs, defective steering gears, and other defects claimed to be the causes of automobile accidents, were not always such, but, together with the accidents, the effects of this property of a spinning flywheel.

REGARDING SOME DEFECTS OF TOOTHED GEARS

AT a recent meeting of the Royal Automobile Club, F. Humphris, the inventor of a gear of the pin and face-plate type, read a paper entitled "Tooth Gears and Gearing." Among other things, Mr. Humphris said that little had been done to determine the efficiency of toothed gearing, and that, in his opinion, the toothed gear was the most imperfect motion employed on the automobile. Considering the grinding and purring of two gears in engagement, could the designer say that it was the system which allowed the wheel to exist, or must he not admit what a clever man the metallurgist was to have provided a material that would stand this barbarous treatment? If the motion of the teeth of two gear wheels when engaging were entirely confined to a rolling character, their life would be practically

indefinite. To improve upon the present system would necessitate making a gear the teeth of which did less sliding upon one another, with a surface contact of greater dimensions, greater strength, less weight, reduction in the number of engagements for the work done, and teeth which, in addition to all these qualifications, will not change in form through wear, thus destroying the curves necessary to their perfect engagement. This could only be done by making the true toothed curves in sympathy with the mating member on which they engaged. The tooth to which Mr. Humphris referred was circular in cross section with a hemispherical end, engaging in a plate having circular holes and driven at right angles from the propelling shaft. Tests showed a very small loss of power in transmission.

AN INTERESTING CHAPTER FROM THE PAST*

By POL RAVIGNEAUX.

DAIMLER is an investigator who has transmitted to posterity the most prolific collection of patents concerning the internal combustion motor and the automobile. From the first, these patents were all taken out by Daimler in his own name, but since 1890 there are found interspersed among them the patents of the Daimler Motoren Gesellschaft and those of

his daily trials, finally succeeded, about the beginning of 1891, in realizing a dream that he had long cherished, that of making without a stop the trip from Ivry to the Point au Jour and return, a distance of about twelve miles. That date marks the origin of the success of the old French house, the investigations of which are so closely related to the researches of Daimler that it is difficult to separate them in giving credit for the results.

It was not until 1893 that Daimler, aided by his engineer, Maybach, succeeded in running the first Mercedes automobile on the road. It may be said here in passing that in order to avoid confusion I have limited my researches regarding the achievements of our predecessors to those prior to and including the year 1895, for about that time so many ideas were being tried out that it would be a most difficult thing to establish their paternity.

The first incursion of Daimler into the internal combustion motor field did not appear to be inspired by a desire for simplicity, for in a patent taken out in 1875 he describes a complicated mechanism covering an idea which Lenoir had investigated and abandoned, that of relieving the piston and connecting rod of the shock of the explosion in an atmospheric motor. To accomplish this, Lenoir placed an extremely heavy piston in a vertical cylinder, so arranged that the explosion lifted the heavy piston, which in its descent was depended upon to perform the work. Daimler added to the ordinary piston in a horizontal cylinder a couple of loose pistons placed at an invariable distance apart and situated on either side of the ordinary piston. The energy of the explosion set these two in motion, and the vacuum set up by the cooling drew after it the motor piston. As was the case with Lenoir, Daimler was on the wrong track, but the latter followed it out until it materialized in the shape of an impractical, delicate and costly machine.

Under this first Daimler patent the piston was cooled by a circulation of water through the connecting rod as is the case to-day in many large stationary motors. The speed of the motor was regulated by a governor on the admission, a valve being placed on the inlet and controlled by the part *d*, shown in the illustration, Fig. 1, which the governor caused to rise or drop, in such a manner that at a certain speed it moved a plate which completely closed the opening. The carbureter was warmed by the water circulation. Referring to the illustration, Fig. 1, the valve *c* could close the inlet pipe when lowered by *gh*, this taking place when the balls of the governor were spread by centrifugal force, otherwise the hook *e* missed *gh*.

FIG. 1.—Governor of Daimler's first motor, patented in 1875.

Daimler et Vve. Levassor, as the patents taken out by Daimler and his French collaborator were termed after M. Levassor's death in 1895. After a time the house of Panhard & Levassor took out some patents in its own name, which we mention later on, in view of the commercial relations which united Daimler with that firm. A short *résumé* of Daimler's career may be apropos here, though it is not the intention to go into detail, a full account of his life being found in *L'Histoire de l'Automobile*, by Pierre Souvestre. He was born in 1834 and died in 1900. It was not until 1863 that he realized his own powers of initiative, after having had a long conversation with Otto. The latter had been interested in commercial pursuits, but had given them up on learning of the work of Lenoir, devoting himself to the development of the gas engine.

Daimler was subsequently employed in a German arms factory and later in an English locomotive works, in the meantime doing what he could, but he matured his plans thoroughly before proceeding, as it was not until 1875 that he took out his first patent. A little later he established relations with M. Sarrazin, the representative in Paris of the house of Otto & Langen, which later turned over to M. Levassor of the firm of Panhard & Levassor the task of executing his plans for a motor. Mmc. Sarrazin later became Mme. Levassor and in this way the house of Panhard & Levassor acquired a license to manufacture under the Daimler patents, as the sole French rights had been granted to Sarrazin shortly before his death, and they descended to his widow.

Daimler had exhibited in 1889 at Paris a gasoline motorboat—this being the principal use which he predicted for his motor—a quadricycle and a miniature tramway, which was shown in operation at the Exposition. He continued his labors at Canstatt, Panhard & Levassor meanwhile working independently. Levassor, after eighteen months of discouraging set-backs during

*Translated from "La Vie Automobile" by Charles B. Hayward.

FIG. 2.—Section of early Daimler, showing tube ignition, patented in 1884.

The last-named part was duplicated because the motor described under this patent of Daimler's was of the two-cycle type.

In 1882 Daimler took out a patent on an inverted cone clutch, and in 1884 he attacked the problem of ignition, believing in the permanent success of burners and platinum tubes, which supplanted the slide valve and pocketed flame, and which battled a long while with the electric ignition introduced by Lenoir, using

FIG. 3.—The predecessor of the exhaust valve cam and customary turning gears.

without the necessity of obtaining a new cylinder head—a piece on which a great deal of work was expended. Ignition by tube, however, was only provided as a means of starting, as Daimler depended on automatic ignition once the motor was under way. Spreading the piston rings some distance apart in order to permit of lubricating them properly was a logical sequence, and constituted an invention on which a number of patents were taken out. In the illustration, Fig. 2, the piston is shown filled at its upper end with *calorifuge*, and the diameter of the piston was reduced at this point, in order to prevent the burning of the oil, as the motor was designed to run on automatic ignition, except when starting, for which the incandescent tube was utilized. The cylinder is represented by *A*, the *calorifuge*, which consisted of slag or cinders, by *B*, and the cylinder head by *C*, while *f* is the hot tube for starting. This patent was granted in January, 1884, while that shown in Fig. 1 was issued in March, 1875. There is also one taken out in 1884 for a fan in the flywheel and an air-jacket as shown in Fig. 4.

The surface of the cylinder head is reduced to a minimum in order to diminish the waste of heat through the walls, something which worried Daimler not a little, while both the valves are placed above the piston. The exhaust is operated by a curved piece, *M*, Fig. 4, terminating in a hook at its lower end. This hook engaged with a similar one on the upper end of the vertical rod *K*, which at its other end carried a roller held in a groove, forming two concentric circles, Fig. 3, thus avoiding the use of a timing gear and secondary shaft. Regulation was affected entirely by the exhaust, a piece carried on the small exterior flywheel acting as a governor and causing the piece *o* to turn so that it missed the valve rod and the valve remained closed. Starting was aided by a compression release.

It was in 1885 that Daimler inaugurated one of the two principal characteristics of his motors; the first related to the functioning of the cycle and the second to the constructional disposition of the cylinders in the shape of a V. His chief idea was that of obtaining the maximum efficiency, as is illustrated by the following quotation from the patent just referred to.

"The new motor which I am about to describe has for its principal advantage the ability to operate at an almost unlimited speed (even up to 1,000 r.p.m.); it weighs very little and takes but little space; its power proportionate to its volume is greatly superior to what can be obtained under any of the present systems, and the importance of this invention for propelling aeronautical machines, torpedo boats, etc., is conceded."

But Daimler looked far ahead and saw clearly. Working according to well-formulated ideas, he had reduced the cylinder wall surface to a minimum, raised the compression and employed automatic ignition, but this did not suffice. In order to

batteries, and with that of Forrest, employing a magneto. Daimler's design is reproduced herewith. See Fig. 2. There will be noted in this the ingenious fashion in which Daimler disposed the motor in order to cool the piston. The cylinder head was cooled by a flange, but this did not reach down as far as that part of the cylinder against which the piston rings bore; these were placed much further down on an extremely long piston. This permitted of replacing the cylinder

simplify things he went back to the lateral arrangement of the valves, but he achieved in other ways more than he lost by this. Before describing the cycle it may be well to study the accompanying sectional view of the single-cylinder motor of the enclosed flywheel type. Are not the splash lubrication, the flywheel assemblage by taper and screw and the disposition of the valves, prototypes of present-day practice? Daimler wished to introduce into the cylinder a supplementary charge of carbureted mixture, or of air, by means of a pump constituted by the crankcase of the motor itself, and, as is the case in a great many two-cycle motors to-day, this was accomplished by placing a valve centrally in the head of the piston. This was at once an automatic and a timed valve.

At the beginning of the exhaust stroke when the piston had arrived at the end of its downward stroke a circular piece, *F*, raising the inlet valve a short time after the exhaust valve opened, the gases which had been drawn through the automatic inlet valve, *T*, placed at the side of the crankcase had by then been strongly compressed in the latter, and, entering the cylinder violently blew out the burnt gases. Until the piston had traveled a certain distance on the upward stroke, this valve remained open and the exhaust continued, so that when the exhaust valve closed it will be seen that the amount of burnt gases remaining in the cylinder must have been very small, and the two did not mix as the cold gas introduced through the piston assumed a stratified form in the lower part of the cylinder. In re-descending, the piston compressed the gases beneath it to a certain point, and then the piston valve reopened and remained open up to the beginning of the compression stroke.

Unfortunately, we do not possess comparative figures showing the power of these two motors, from which a conclusion regarding the utility of this complication could be drawn. Daimler's chief object was to produce a motor of the maximum power which should be the quintessence of lightness, and we should not overlook the fact that it is due to that lightness of the explosion motor that the automobile is possible. To-day, if it were possible to obtain greater power from a motor by adding Daimler's valve, it would not be done by reason of its complication and fear of breakage, and because the extra power thus obtainable is not a great necessity. We are well enough served without it, but in 1885 it was necessary to make arrows out of any wood; the power output of those days was not that of the present. It is not astonishing, in view of this, that Daimler should have sacrificed simplicity to attain this end. This brings Daimler down to the time when he became an autoist.

FIG. 5.—Inclosed flywheel type with valve in piston, patented in 1885.

A STORY OF THE CRY OF "GET A HORSE"

BY A. V. A. MCHARG, EDGEWATER, N. J.

TO the funny side of automobiling I want to add my own little story of pioneer effort in the whiz-wagon industry. It was just after Alexander Winton had made his trip from Buffalo to New York in a gasoline wagon of his own design that my ambition to produce a self-moving vehicle became uncontrollable. Reasoning that if one horse pulled a wagon satisfactorily a one-horsepower motor should be able to do as much, I soon came across in our local papers an "ad" of a small farm motor of just the desired power—and many other wonderful qualities to boot. I lost no time in arguing my young wife into the belief that an expenditure of sixty dollars toward a motor wagon would be fully repaid by our increased social prominence—and the motor was duly purchased.

I had never seen a gasoline motor, nor had any member of the family, and so it was with fear and trembling that the last connections were made and about a pint of "that stuff they clean gloves with" was emptied into the tank. The electric switch was turned on, and, cautiously, the flywheel was turned according to directions, with no results. The family courage began to rise and they gathered more confidently around the little marvel. Suddenly there was a spit and a flash, then a roll of musketry as the little marvel became a little devil, and straightway there was a sincere effort on the part of the family to leave me alone in my researches.

How I Conceived the Idea of Building an Auto.

After several evenings spent in running the little motor—and also in finding out why it wouldn't run—I decided to get to work on designing and building the wagon that should contain this remarkable source of power that was guaranteed to run a farm, milk the chickens and churn the eggs. I lost a whole week and two fairly good bicycles trying to adapt their running gear to my needs, without success. So I sent for some wire wheel catalogs, and finally ordered four steel rims and a sufficient number of spokes. The hubs were made of brass, with flanges for the spokes and a hole for one-inch cold-rolled steel axles. Here I was confronted by a new problem: I had to build and house this vehicle in the kitchen of our dwelling, and the only means of egress was a three-foot-six window opening on the street level, consequently I was limited to 3 feet 5 inches for the width of my wagon.

A Machine That Was Fearfully and Wonderfully Made.

After much thought the wagon was built on the "buckboard principle:" two oak planks about five feet long, one inch thick and ten inches wide were bolted to two battens at the ends. The rear axle turned in brass bearings bolted to the planks, while the front axle swiveled on a king bolt and was controlled by a steering post and handle that projected up through the planks. The motor was firmly set amidships and bolted down to the plank frame. The crankshaft projected out on the left hand side. On this shaft was keyed a four-inch pulley, carrying a two-inch belt that drove an eight-inch pulley on a countershaft. On this countershaft was keyed a two-inch gear meshing with a ten-inch gear keyed to the rear axle. The driving belt was loose and only drove when an idler was forced into position by a lever at the "chauffeur's" right. There was no provision for reversing, it being forward only that we hoped to go. After the cooling tank and the gasoline tank were placed, a wagon box and seat were built around the machinery. True the family and a few intimate friends admitted confidentially to me that there was a confounded resemblance to a dog house about the thing, but I excused that on the ground that

they could not keep pace with my marvelous originality.

Well! one starlight night in November the last bolt was tightened; the last bit of paint was dry, and, after a hurried evening meal, we filled the tanks with water and "glove cleaner" and took the sash out of the basement window.

We rolled this marvelous creation out by the curb, and the crowd soon began to collect and the comments to fly: "What are you going to keep in it?" "Whose dog have you got in there?" "Which way will it run if it goes?" etc. Spurning all remarks, I threw on my electric switch, opened my gasoline valve, and, thanks to a merciful providence, the motor started at once; whereupon I cast a compassionate glance at the startled crowd, for as yet a muffler was unknown to me and the noise seemed to indicate power, so I liked it.

First Trial Was an Event in Local History.

Inviting my wife to take the seat of honor at my left, I jumped to the operator's seat, and with a trembling hand pushed the starting lever into position; slowly, slowly, she started and slowly she continued to move, in fact, that was her maximum speed, and to the great joy of the crowd they were able to keep alongside of us at an easy gait and resume their study of the situation and compose remarks calculated to establish their reputations as humorists. We finally—I say finally—reached one of the principal streets, and by that time had accumulated quite a following, sufficient in fact to arouse the curiosity of a police officer who came toward us on the double quick to investigate the riot that was rapidly assuming such serious proportions. At first he was nonplussed, then, making one of those quick decisions for which the law is famous, he decided to grant us his protection, and informed us that as long as we stayed on his beat we could get a square deal. So he nonchalantly swung his club, walked alongside, and kept up a running fire of conversation, which was eventually interrupted by my running up a slight grade ending in car tracks.

Sad Ending of an Experimental Career Well Begun.

There we stuck, and, try as I would, I could not keep that belt from slipping. To add to the embarrassment of the situation a trolley car appeared, but in spite of the interest we created the motorman refused to tie up the line indefinitely. So with the help of the officer the devil wagon was backed off the tracks against its will and down the grade where we managed to turn around and get under way on our homeward journey. All went well, though slowly, until within a block of our house, there she stopped, and stopped for good. No amount of engineering skill, no amount of outside advice availed to produce further action; so upon that spot, covered with ignominy and oil, I was at last compelled to solicit assistance and push the blamed thing home, in through the kitchen window, put up the shutters and quit for the night, amidst cries—uttered for the first time on earth I believe—"Get a horse!" "Get a horse!"

So ended my first attempt to be an automobilist. I afterwards located the fault in my motor, but never succeeded in making the vehicle go faster than a walk or up an incline greater than two per cent. I finally sold my motor to a farmer, where it apparently felt more at home, for, so far as I know, it is running yet and giving complete satisfaction.

British Board of Trade reports for the month of November, 1907, show the number of cars imported into Great Britain was 409, and for the corresponding month in 1905 and 1906 was 352 and 359, respectively.

PRAIRIE SCHOONER FORMERLY USED BY LIEUT. GIMPERLING.

HOW THE AUTO AIDS UNCLE SAM.

Lieutenant Gimperling, 21st Infantry, U. S. A., evidently does not place overmuch stock in the saying that nothing can take the place of the army mule for getting there, for, having been detailed by General Thomas, commanding the department of Colorado, to make a progressive military map of southern Arizona, he has decided to do it in an automobile and has selected a Stoddard-Dayton in place of the time-honored covered army wagon. Instead of averaging twenty to twenty-five miles a day, the survey will proceed at that rate *per hour*. The party consists of the lieutenant in charge, H. M. Westcott, and Arthur Harris, the driver, and they left Denver recently en route for Fort Huachuca, Ariz., a preliminary thousand-mile trip which has to be undertaken in order to reach the scene of their labors. The route there lies via Pueblo and then along the old Santa Fé trail through New Mexico and Arizona, their objective point being located in the south central part of Arizona, to reach which it will be necessary to travel through country of a nature that has done much toward earning the army mule his reputation of being able to get there, for prior to the advent of the automobile the mule and the broncho were the only animals of transport sufficiently hardy to be able to withstand the rigors of such work as it entails.

There a detail of troopers and a mess-wagon will be assigned them as the work, which consists of making a topographical map of southern Arizona, will require several months for its completion. The Stoddard-Dayton car employed is not the property of the army, but is owned by Mr. Westcott. It will be used for the entire trip, and as it is the first time that an automobile has ever been employed for the purpose, the outcome will be watched with interest, particularly by General Thomas, who granted its use.

LIEUT. GIMPERLING IN STODDARD DAYTON ON THE WAY.

A COPPER TUBE CENTRIFUGAL RADIATOR.

A distinct departure from the types of honeycomb and tubular radiators, which form the two main classes of appliances for cooling the water of an automobile engine, has been produced by the firm of Goudard & Mennesson and was offered for public inspection for the first time at the recent Paris exhibition.

The G. & M. consists of a mass of copper tubes forming a circle three or four inches in depth and about four inches from front to rear, united at opposite points by a couple of collectors forming inlet and outlet. An idea of the general arrangement can be obtained from the illustration, reproduced from *L'Automobile*. To allow of the free passage of air the tubes are separated from one another by the two ribbed frames shown at left and right of the cut.

COPPER TUBE CIRCULAR RADIATOR.

Within the circle a powerful centrifugal ventilator is mounted, the steel plate at the rear and radiating arms in front affording a bearing for this.

VENTILATOR TO BE CENTERED IN TUBES.

The warm water arriving from the motor by the upper collector is distributed through the tubes to the lower collector, from which it passes, cooled, to the engine again. At the same time the centrifugal fan is drawing in cold air by the central opening and throwing it upon the rings of tubes. It is claimed that efficiency is so much greater by this system that instead of running the fan at two or three thousand revolutions a minute, as is often done, it can be run at 1,200 revolutions and supply all the draught required. By this system the radiator is completely independent of the hood of the motor and has the advantage of not drawing in dust on the engine, as is done when the fan is placed immediately behind the radiator. A claim of robustness is put forth on the grounds that the rings of tubes are merely clasped between the two steel plates, and that the group has a certain suppleness which prevents it suffering from road shocks. The radiator has been used on stationary engines, the fan being driven by belt off the engine flywheel.

"To instantly locate a knock beyond the shadow of a doubt, borrow a stethoscope and use it on the motor as a doctor would on a patient," says a young auto engineer who is also an M.D. Of course, every autoist cannot borrow such an instrument, and the majority would not know how to use it if they could, but the facility and certainty with which it distinguished a knock as being in the wrist pin of a certain cylinder, all other tests failing, was certainly amazing.

LETTERS INTERESTING AND INSTRUCTIVE

LAYING UP A CAR FOR THE WINTER.

Editor THE AUTOMOBILE:

[1,093.]—I would thank you very much for some information on the following. In laying up my two cars for the winter in my suburban home on Long Island, both of which are of the same make and both two opposed cylinder engines, I ask: If I open the pet cocks in the radiators, will it completely exhaust the water from the radiators and the cylinders, or whether enough might remain to cause freezing and damage. Again in jacking up the car, taking the weight from the tires, is it better to allow them to be fully inflated or to deflate the tires, or only partially so? Also, will gasoline left in the tank freeze in low temperature? Also, would you suggest in allowing the lubricating oil to be left in the oiler or withdraw same? Should the spark plugs be removed from the cylinders and a small quantity of kerosene put in to prevent rust? In short, any information that you can give me as to minor details of laying up a car for the winter will be fully appreciated, and I think beneficial to the owners who care for their own cars.

Trusting you to answer this in your most instructive column of "Letters Interesting," I remain,
T. C. SNEDEKER.
New York City.

Putting a car out of commission for the winter may consist of anything from running it into the barn and closing the door, to a most elaborate process, but it is not advisable to adopt the first extreme and not necessary to go to the latter. Whether the radiator petcock will drain the entire system of water or not, depends on its location. If it happens to be the lowest point in the circulating system it will, but it is advisable to open other connections, as at the pump, or other convenient point as low as possible in order to be certain of getting all the water out. We should think that it would be preferable to have the tires partially inflated, but tire experts may disagree on this point, however. Before leaving them this way, they should be removed from the rims, and if the latter show any signs of rust, this should be removed and the rims given one or two coats of shellac, the tires being replaced after this has dried. The gasoline is not at all apt to freeze at any temperature usual in this latitude, but as it constitutes an element of danger in that it is considered to greatly increase the fire hazard to any building in which it is present, it is preferable to empty the tank. This also applies to the lubricating oil, but for a different reason, namely, that the oil may thicken or gum in the tubes and be more difficult to remove in the spring. Empty the entire lubricating system and flush it out with gasoline. It is also advisable to inject a little kerosene in the cylinders, but the plugs should be replaced. Any bright steel parts that are apt to rust should be coated with grease or thick oil.

DERANGING THE VALVE-TIMING OF THE MOTOR.

Editor THE AUTOMOBILE:

[1,094.]—In letter No. 1,062, published in the January 2 issue of "The Automobile," a subscriber asks you the following: "If, in timing an engine, the two to one gear is slipped one cog either forward or backward, can the correct timing be made again with the commutator, pushing it either forward or backward?" You answer that it can, saying that moving the commutator will naturally compensate for shifting the gears. That is true as far as the ignition is concerned, but it is not also true that any change in these gears changes the timing of the valves themselves, and this cannot be corrected by moving the commutator. Would not your answer to this question be liable to cause him some trouble?

Brattleboro, Vt.

CHARLES A. SMITH.

It would, unless, as we presumed, to be the case at the time, it was only intended that the pinions should be revolved forward or backward, and not their camshafts, though as a matter of fact we must confess that this was something which was overlooked in answering the letter in question. If the timing gears were moved backward or forward, while attached to their respective camshafts, this would naturally move the inlet and exhaust cams one way or the other and a derangement of the valve-timing would necessarily follow.

NOT THE BATTERIES THAT ARE FAULTY.

Editor THE AUTOMOBILE:

[1,095.]—Please answer the following in "Letters Interesting and Instructive." I use a Spltdorf coil, and for some reason the dry batteries do not seem to last but a short time. I have used "Ever Ready," Columbia, and two or three other good makes. By the time they have run 300 or 400 miles they will not register more than 1 or 2 amperes. I have a single-cylinder Oldsmobile runabout. Is it the coil? Is it because the batteries are grounded too long? I have followed the instructions of the manufacturer in the length of revolution of engine in grounding batteries, 1-3 of one revolution of engine, which is a four-cycle.

SCHUYLER G. FOSTER.

Allegan, Mich.

It is quite evident that the cells you have been using have not been at fault, but that the trouble is to be found either in the timer or coil, or possibly both. We presume you wish to be understood by "grounded for 1-3 of a revolution" that this is the duration of the contact employed to produce the spark, in which case it is nothing strange that you have had experience of this nature with dry cells. While makers differ on this point, 50 to 60 degrees on the crank circle is ample to allow for advancing and retarding the time of sparking, slightly more being allowed for advancing than retarding. This would be only 1-6 of a revolution, but as a matter of fact, we do not believe that as much as this is allowed on the majority of present-day cars, so that you are wasting a very large percentage of the current delivered by the batteries. The Oldsmobile runabout was not distinguished by a very advanced form of timer, and doubtless a new and up-to-date device, which could be fastened to the rear end of the camshaft most conveniently, together with the proper adjustment of the coil, would remedy the difficulty.

WHAT PREVENTS A WORM GEAR STRIPPING?

Editor THE AUTOMOBILE:

[1,096.]—Could you answer a few questions through your valuable medium "Letters Interesting and Instructive?" Some cars, foreign, I believe, employ a worm drive. My question is: Why do not these gears strip when the driven member of the transmission becomes the driver, as is the case when the power is shut off? I have before me an "ad" cut from some journal, giving an illustration of a Christie touring car. Could you, or have you, described this car (either tourist or racer) in detail? Mr. Christie has made such a radical diversion from standard lines that, while we are all familiar with its appearance, I find few people who know much about its mechanical features. All they know is that it is front drive, but when they try to enumerate, I find they do not know much more than myself. Perhaps your answer will be long, but I know you will go a long distance out of your way to oblige a writer—much more than several editors which I have in mind.

Brooklyn, N. Y.

ROYAL H. WALTERS.

A number of heavy 'buses, which we believe are still in daily use in London and vicinity, are equipped with a worm drive. The same is true of the Mitchell commercial cars made in this country, and it has been reported from time to time that others were considering its adoption. The reason that these worms do not strip when driven by the car instead of driving it, is due to the fact that the pitch of the thread has been calculated to avoid this, in which respect they differ from the ordinary worm gear.

The Christie racing car which was run in the Grand Prix in France and in numerous races in this country since then, was described in detail in the issue of THE AUTOMOBILE of April 11, 1907. The transversely placed engine drives the front wheels directly through the medium of a conical friction clutch at each end of the crankshaft, so that when the car is running on the direct drive the wheels are practically on extensions of the crankshaft, universal joints being interposed to allow for relative movement, and they make one turn for every revolution of the motor. To provide a low speed forward, a small pinion attached to the center of the

crankshaft meshes with a large spur pinion on a countershaft running parallel with the former and inside the crankcase. At its ends this countershaft carries pinions which mesh with gears attached to the driving clutches of the front wheels. The cylinders of the motor carry copper water jackets, the exhaust valves being placed in the center of the head, while eight small automatic inlet valves are placed round it in a circle. Both the cylinders and the pistons are of steel. The maximum engine speed is 1,200 r. p. m., and as the direct drive gives one turn of the road wheels for every turn of the engine, the car is capable of a speed of two miles a minute. In the construction of the touring car since brought out, standard practice has been followed to a great extent; valves are mechanically operated, iron cylinders and the like. The change speed gear is mounted on the countershaft referred to and three speeds are provided by gears sliding on it, the drive being from the end of this shaft to the wheels, there being no direct connection between the latter and the crankshaft as in the racer.

A PROBLEM IN VIBRATION.

Editor THE AUTOMOBILE:

[1,097.]—Kindly tell me what it is that makes the vibration on the right side of the car so much greater than on the left. I have noticed with several different cars that the mud guards, lamps, etc., on the right side become loose much more frequently than those on the left side. I cannot myself arrive at any reason for this, but I am as sure that the fact exists as I am of my own inability to explain it.

HIRAM BAINBRIDGE.

Mattoon, Ill.

The only thing we can suggest is that the greater vibration on the right is caused by the torque reaction of the motor. Most automobile engines run to the left, counter clockwise, as viewed from the seats of the car, with the result that the frame and body tend to revolve in the opposite direction, compressing the springs on the right more than those on the left, and very possibly giving rise to the vibration you describe. This is simply our idea. If it is correct, things should loosen most frequently on the left side of the few shaft-driven cars in which the motors turn opposite to the usual direction, and should loosen no oftener on one side than on the other or any chain-driven car. Perhaps some of our friends driving cars with double-chain drives and with back-handed motors will be so good as to further enlighten us.

PLACING A SMALL ENGINE IN A LARGE CAR.

Editor THE AUTOMOBILE:

[1,098.]—At what horsepower would you rate a two-cylinder, two-cycle gas engine of 4 1/4-inch bore by 3 3/4 stroke, at 1,500 r.p.m.? What arrangement (size and kind of muffler and piping) would you advise to make this engine perfectly silent? At what speed (miles per hour) would you gear a 7-passenger machine weighing about 1,400 pounds with engine mentioned above, friction transmission, and double side chain drive to 28-inch wheels? Also what size of full elliptic springs (intend to use four) would you advise for above machine, with solid rubber tires?

SIMPLEX.

Seattle, Wash.

Granting that the efficiency of your motor is good, it should show 14 to 15 horsepower at this speed under favorable conditions, i.e., assuming that the motor draws in a fairly full charge and gets rid of the greater part of it when running at this rate. Use 1 or 1 1/4-inch wrought-iron pipe for the exhaust and lead it aft with as few turns as possible until the muffler is reached. State your requirements, giving motor dimensions, and the like, to a manufacturer of the latter and let him supply you with a muffler. This will be far easier and less expensive than attempting to make it yourself, although there is nothing complicated about a muffler.

It strikes us you are rather ambitious in making a seven-passenger car with such a small engine, although the car weight given is very low. We should not advise gearing the car to do more than 15 to 20 miles an hour on the high-

speed, if it is intended to transport such a load. For the suspension, a pair of 36-inch springs with six leaves 1 1/2 inches wide, on the rear, and 32-inch springs with six leaves one inch wide for the forward pair, should make the car ride comfortably when loaded. These figures are not based on any particularly accurate data, and it will be found that the action of the springs will depend to a very large extent on the nature of the material of which they are made. The figures given could be increased slightly if the maximum load were always to be carried, but it would make the car ride very stiffly when empty.

WHAT IS THE CAUSE OF THIS LOSS OF POWER?

Editor THE AUTOMOBILE:

[1,099.]—Will you please answer a few queries of mine in the next issue of "The Automobile?" I have an 8-horsepower, single-cylinder runabout, and having had trouble with the motor recently had the cylinder rebored and a new piston installed. Since doing this the car has neither the power nor the speed it had before the repair was made. In reboring 1-32 inch was taken off, and the man who did the work said the car would have more power and speed than ever. Should not the connecting rod have been lengthened in order to give the same compression as before, as I note that the motor no longer has a high degree of compression as before the work was done? The valves are tight, and I have installed a new coil, as well as a new Schebler carbureter. I have done everything possible to improve the running of the car, but cannot get the power or speed out of it that it had previously. Any information you can give me will be appreciated.

F. L. CLARK.

Chicago, Ill.

If the new piston were of the same length as the old one, there appears to be no reason why the connecting rod should have been lengthened in order to give the same degree of compression as formerly. But it may be that in fitting the new piston, a shorter one was procured, as this appears to be the most likely cause of the drop in compression, if it be true that the valves are perfectly tight and the piston rings make a good gas-tight fit with the cylinder walls. Assuming, however, that the piston is of the proper length and there is no leakage, it would seem very likely that the trouble is due to improper timing, either of the valves or of the ignition, in reassembling the motor. The intake valve should open just previously to, or exactly at the moment, the piston reaches the upper dead center, and should not close again until the piston has started upward on the compression stroke, 15 to 20 degrees on the crankcircle. The exhaust valve should open about an equal distance prior to the completion of the power stroke, and should close just before the inlet valve begins to open on the suction stroke. In both cases this is termed the *lead* given the valves and is essential to efficient running in any high-speed motor. Test the openings of the valves and see if they correspond to the above, or come close to it. The ignition should be set so that it can be advanced some 20 degrees or more, measuring on the crank circle—i. e., 20 degrees before the piston reaches upper dead center, and so that it can be retarded 10 or 15 degrees after passing that point. If you find that an examination of the motor verifies these details, there seems to be little doubt that the compression is at fault.

BALL THRUST BEARINGS.

Editor THE AUTOMOBILE:

[1,100.]—I am building a car of my own design in a small shop here, and I am planning to use annular bearings throughout the transmission, but I am somewhat at a loss as to what provision to make for the thrusts, since the makers advertise both thrust and radial bearings, and yet commend the use of the latter for taking thrusts—a practice that seems to be followed by many makers of high grade cars. If you can enlighten me as to the respective merits of these two types of bearings for thrust loads, and the determining factors, which call for the use of one kind or the other, I will be vastly obliged. There are not so many cars or authorities on them in this part of the world as there are in older communities, and the consequence is that we have to secure our information at long range.

MELVILLE E. TELFORD.

Melbourne, Australia.

The special thrust ball bearings you mention are considerably smaller for given loads than are the radial ball bearings used for thrust. They are, however, less suitable for high speeds and for constructions in which there is any side play, though two types are made—one for very low speeds with both races grooved, and the other for higher speeds with one race flat—to allow for slight inaccuracy. One of the races of all these bearings has a spherical seat, that it may accommodate itself as exactly as possible to the direction of the load. Evidently with this construction the least misalignment of the seat of the other race on the shaft, or of the shaft itself, will produce a rapid rotation of the spherical member, certain to cause trouble at very high speeds. The radial bearings used for thrust permit very high speeds, but must not be used in this manner for much over one-third of their radial load capacity. And for all but very light loads they are not advised for carrying both the radial and the thrust loads in the same bearing, two adjacent bearings being used, one so mounted as to receive one load while the second receives the other.

WHERE CAN LICENSES BE PROCURED?

Editor THE AUTOMOBILE:

[1,101.]—Where in New York City can application be made to obtain a chauffeur's license?
R. H. W.
Brooklyn, N. Y.

To our knowledge there is no place in New York City where applications for chauffeur's licenses may be filed. Apply to the Secretary of State, Albany, direct. Blank applications, however, are usually to be had at many of the garages.

TO MAKE CYLINDER CASTINGS LIGHTER.

Editor THE AUTOMOBILE:

[1,102.]—Having built several motor trucks and wishing to construct a large truck without the usual weight and trouble of cracked, coarse-grained and pin-holed cylinders, I went to an iron expert of years standing and told him of my desire for better cylinder construction. After a year's experimental work in the melting of iron, he built me a four-cylinder engine with cylinders so light and of such apparent thinness that I at first refused to accept the engine. However, on his personal guarantee I placed it in a large truck, and after eight months of the hardest kind of usage, after being subjected to the severest kind of tests and engine overheated, I believe my friend has discovered a new process in the melting of iron that will be eagerly sought after by all manufacturers of automobile cylinders.

The following explanation will serve to show practical foundrymen that this new process will avoid the difficulties caused by the present method of melting iron for automobile cylinders.

Why is the first iron drawn from the cupola harder than the succeeding withdrawals, the iron mixture and other conditions being the same? The iron, on leaving the melting point in a cupola does so in dribs, globular in form, coming in contact with the coke on its way to the bottom. Each globule is deflecting when uniting with other dribs, at the same time absorbing sulphur and other foreign substances, which cause a great degree of hardness to the iron. This trouble is augmented by small particles of iron coming in contact with the cold blast, on its passing the tuyeres. The cold blast comes in contact with it in a comparatively finely divided state, the action of the cold blast having the effect to chill the iron, partially eliminating and combining its graphitic carbon in the iron before reaching the bottom. Owing to this defect and the sides of the cupola not having the heat equal to the melted iron, the iron is again chilled and more graphitic carbon is converted into combined carbon. By the time the first charge is down, small ducts or veins are formed, with the fuel below the melting point and by slag adhering to the fuel, the melted iron keeping the passage open in the ducts during the entire heat. As soon as formed, this passage protects the iron in its downward course from any action from the blast, hence no material change occurs in the iron on account of the cold blast. When the iron reaches the bottom, the latter being heated by the iron previously passing over it, it will not be subjected to the chill which the previous iron was accorded, and again we have less cause for variations in mixtures than we had with our first charge and melt. Considering the above explanation as facts, it seems no strange matter why affairs are thus.

For the manufacture of automobile cylinders by this process we find that the iron is very close in grain, and very soft and toolable. It is absolutely free from pin holes. The iron is sufficiently soft to caulk, and is very fluid in consistency, equal to semi-steel in tensile

strength. Under this process, automobile cylinders can be made much lighter than under the present method of melting iron.

The writer would be glad to give further information to any one interested.

Warsaw, Ind.

ALLEN S. WIDEMAN.

ANOTHER AUTOIST'S "IDEAL" AUTOMOBILE.

Editor THE AUTOMOBILE:

[1,103.]—I have seen in the columns of "The Automobile" at various times sets of general specifications which their authors state as representing their respective ideal cars, but none of these seem to me to be all that they might be. I am not an active participant in the sport, but have studied automobiles from a mechanical standpoint for several years, and the following specifications represent what I consider to be as near the ideal car as can be had with the present knowledge of gas engines. This ideal car would be of medium power and weight and have a seating capacity of five adults. Specifically the weight would be about 2,000 pounds. The car would ride on 34 by 3 tires in front and 34 by 4 tires in the rear, where much more than half of the work is done. The wheelbase would be about 110 inches, and the track 56 inches.

For a motor, I would have a three-cylinder, two-cycle, air-cooled, vertical engine of 30-35 horsepower, supported from the main frame at three points in the usual forward position. The drive from the motor would be a multiple-disc clutch in the flywheel, and thence, by means of an inclosed propeller shaft with one universal joint at its forward ends, to a sliding gear set in an integral casting with the bevel gear housing on the rear axle. The tube which inclosed the propeller shaft would be arranged to take the thrust and torque set up by the transmission of the power. The gear set would have four speeds ahead and one reverse, direct drive being had on the third speed. The rear axle would be of the floating type.

The frame would be of pressed alloy steel, of channel section, with a drop in front of the rear axle. It would be supported on semi-elliptic springs in front and three-quarter platform springs in the rear.

The frame would be of pressed alloy steel, of channel section, with would be made up of the usual clutch, accelerator, and brake pedals, only the clutch and brake pedals would be reversed for convenience. The change gear and emergency brake levers would operate on concentric quadrants, the one the full gate type, and the other of the usual ratchet pull-up form. The throttle and spark levers would operate on a stationary sector on top of the steering wheel, with the throttle lever long enough to reach to the rim of the steering wheel. Steering would be wheel-actuated, with a fully adjustable worm and unit, all connecting links being joined by ball-and-socket joints, and the cross connection link lying in back of the front axle, where it is protected from harm.

I would use a dual system of ignition, one system being operated from storage batteries and the other operated from a low-tension magneto with coil, the whole so arranged that either or both systems may be used at the will of the operator.

While my motor and control location do not conform to common practice, they seem to me to be the simplest and most convenient, and in the case of the motor, as efficient as almost any of the modern cars.

Worcester, Mass.

FRED B. FAY.

FURTHER DATA ON IGNITION ECONOMY.

Editor THE AUTOMOBILE:

[1,104.]—The case of the dry battery vs. the magneto is very well presented in the letters of E. Leeds Powell and Herbert L. Towle in your recent issues. As Mr. Towle says, if the dry battery were called upon to furnish only the current necessary for ignition, it would last long enough to answer every ordinary purpose, even without considering the possibility of making batteries that would outlast those now in use. We understand that the Semi-Dry Battery Co., of Newark, make a battery in which the chemicals are contained in a thin paste, instead of being absorbed in the blotting paper, as in the ordinary construction. Possibly this is the battery which Mr. Powell has in mind. Its makers claim that while its capacity is perhaps no greater, it does not dry out as soon as other kinds.

A consideration which is not alluded to by Mr. Powell or Mr. Towle is the fact that when contact is made and broken mechanically, the current required for this purpose must be stronger than that required to make a spark. The Atwater-Kent spark generator is the result of a great deal of research and experiment with the view of consuming the smallest possible current, and the results obtained with it are due, not simply to the fact that only one spark per ignition is made, but also to the fact that contact is made and broken mechanically by a shaft driven from the engine; so that it takes place with equal positiveness, whatever the strength of the battery may be. In addition, the duration of the contact is extremely brief, and is constant, regardless of the engine speed, though capable of being adjusted by the operator to suit the

strength of the battery. Users of this device report mileages all the way from 1,000 to 3,000 or more in service on six ordinary dry cells. In view of these facts, we believe we have come as near as possible to the ideal method of economizing battery current.

Philadelphia, Pa. A. ATWATER KENT.

EFFICIENCY OF THE FOUR-WHEEL DRIVE.

Editor THE AUTOMOBILE:

[1,105.]—Will you kindly give me space in your next issue of "The Automobile" to answer the question, "What is the efficiency of the four-wheel drive," as asked in your communication No. 1046, published in the December issue? I have had practical experience with a four-wheel driven auto, and have come to the conclusion that the four-wheel drive is the only practical method of applying power to a vehicle.

In the first place from 25 to 40 per cent. of the power is saved; second, the vehicle will not slough or skid in mud, snow or sand. I consider this a very important item, as sloughing is the cause of numberless bad accidents; third, it does not wear out only about half as many tires, for the reason that when you apply the power on all four wheels they turn, and the machine moves, and the wheels do not skid, as they do very frequently on a rear-wheel drive, thereby grinding off the tires; fourth, the mechanism of a four-wheel drive will outwear that of any other machine, for the reason that all back chuck caused by striking obstruction in front is eliminated, as the driven wheels climb over the obstruction rather than bumping into it.

I am running a four-wheel drive under a twenty-horsepower, two-cylinder motor geared to run 1,200 revolutions a minute empty, the power is reduced to permit the vehicle to run thirty miles per hour. With this machine with 30-inch wheels, weighing 2,700 pounds loaded with nine people averaging 140 pounds each, I have climbed a 10 per cent. grade 600 feet long, on the direct speed.

Is there a rear-wheel driven machine on the market with the same rate per horsepower which will do the same work? The machine I am driving is manufactured by the Four Traction Auto Company, of this city.

ERNST ROSENBERGER.

Mankato, Minn.

DISAGREES WITH MR. FAY ON CARBURETION.

Editor THE AUTOMOBILE:

[1,106.]—It is greatly to be regretted that anyone who knows so much about certain phases of automobile engineering as does Mr. Thos. J. Fay should jeopardize his reputation with those who are well informed and mislead those who are not by such erroneous statements and poor English as appeared in his article in the issue of January 2.

Mr. Fay ought to know by this time that the richness of the mixture increases with increasing speeds unless special provision, such as the modern auxiliary air valve, is made to prevent it; that the scavenging effect is better at high than at low speeds because of the greater momentum of the issuing gases during the expulsion stroke; that it is no more difficult to time the spark properly at high than at low speeds, but that for a given rate of flame propagation there is a certain piston speed, beyond which it is inexpedient to run because the ignition cannot be advanced sufficiently to give full combustion without causing too much back pressure toward the end of the compression stroke; and that it is the product, not the sum, of torque and speed that determine the horsepower.

An abridged dictionary will tell Mr. Fay that it is "constriction," not "depression," that is required in the intake pipe, where the nozzle is located, and that to "combust" is not by any means to "burn."

Time and space limitations preclude anything like an exhaustive enumeration of the lesser errors, but the foregoing are ample to indicate what might be considerably designated as the carelessness of utterance which mars what could have been made an excellent article.

CECIL P. POOLE,

New York. Editor, "Power."

AN AUTOIST TAKES MR. FAY TO TASK.

Editor THE AUTOMOBILE:

[1,107.]—As I am a constant reader of your paper, I respectfully ask your privilege to differ with Mr. Thos. J. Fay on one point, in his article, "The Fuel System of Automobiles." He claims that the needle valve for adjusting the flow of gasoline in a carbureter is of no use at all. He says, after two years' trial, he finds it serves no useful purpose at all; in fact, it does some harm, as it eliminates the true nozzle effect. I will agree that if a carbureter has been fitted to a particular engine by getting the opening in the nozzle just right, which can be accomplished only by many trials and with the use of a brake, satisfactory results may be obtained. But should such carbureters be furnished by the different makers for use with different engines, would not the repair men have a pleasant time getting them properly adjusted? I have also found the needle valve

a good friend when gasoline of different density is used and when the float has become a little "cloggy," for it is then but the work of a moment to slightly cut down the opening of the nozzle, when the same amount of fuel can be had without further trouble.

Now it is just as easy to locate the needle valve between the float chambers and the nozzle (as some makers do), in which position I am sure he will agree it does not interfere with the nozzle effect in the least. It makes possible the use of as clean a mixture as the engine will operate on successfully, which in turn means a cool engine and less gasoline bills.

The fact that such builders as Franklin, Duryea, Thomas, and many others of unquestioned reputation use this form of adjustment would seem to indicate that it must be of some use, at least.

Phoenixville, Pa.

LEWIS T. RHOADES.

ANOTHER PHASE OF "POLISHED vs. UNPOLISHED."

Editor THE AUTOMOBILE:

[1,108.]—Brass, nickel, and painted lamps have had their innings in issues of "The Automobile," October 17 and December 19. Each have their respective merits. It must be acknowledged that there is no substitute for clean brass. Now, Mr. Manufacturer, you equip your cars with elegant bodies, especially the limousine, using many permanent brass fixtures and fittings fastened directly against elegant upholstery, trimmings, or painting. These fixtures are not exempt from tarnishing, and tarnished brass was well compared to a dirty linen collar.

Metal polish is most detrimental to fine paint or fabric. Lamps can be removed and satisfactorily polished, but what is to be done with these many permanent brass parts inside and outside of sensitive finished bodies? True, some can be partly polished by holding a clean cloth next to the part liable to permanent injury, but this is like the man who cleans his shoes and neglects the heels.

I believe that the experienced men in this special department ought to be able to overcome this evil, and if there is no fit substitute, they can at least avoid much unnecessary display of brass, as the finest carriages do not require a lot of brass to give them elegance.

M. G. AUGSPURGER.

Cincinnati.

WILL J. G. C. EXPLAIN THOSE OIL FIGURES?

Editor THE AUTOMOBILE:

[1,109.]—In your issue of January 2, J. G. C., of East Orange, gives the cost of running his automobile 6,000 miles. It is very interesting, but presents nothing out of the ordinary except that part wherein it is stated that he averaged 387.09 miles to a gallon of cylinder oil. This is so obviously an error that I hope I may be permitted to ask him to throw a little light on the subject. I am running a car similar to his in all respects but one—a runabout instead of a touring car—and when I average 100 miles to a gallon I think I am doing well. And I know lots of others who think the same.

New York City.

MUNCH HAUSEN.

"NATURE-FAKING" AND THE "FOUR vs. SIXES."

Editor THE AUTOMOBILE:

[1,110.]—Apropos of the six versus four-cylinder controversy, one correspondent says, "Let us look back to Nature," a horse has four legs and not six." Continuing the "nature faking," how about the airships? They use motors having eight, twelve, and sixteen cylinders, while birds have only two! Is it because flying insects have six legs and four wings? Submarines should have no cylinders at all; only turbines being au fait; but they will get there just the same. Has Maxwell his eye on the centipede? Next!

Rochester, N. Y.

E. T. BIRDSALL.

SOMETHING FOR MR. SHANKS TO ANSWER.

Editor THE AUTOMOBILE:

[1,111.]—I noticed in your issue of December 19, that C. B. Shanks takes exception to the comparison by a four-cylinder enthusiast of what a horse can do with four legs, and brings forth the ostrich as an exponent of the two-cylinder. Does he take into consideration the comparative wheelbases of the two "birds" when it comes to smooth running?

Los Angeles, Cal.

J. MURRAY PAGE.

A HELPING HAND FOR FORD OWNERS.

Editor THE AUTOMOBILE:

[1,112.]—I have noticed on several occasions complaints from owners of the Ford runabouts about their engines using too much battery. I had this trouble for a time, but have overcome this. I will be glad to give any owner of the Fords my experience if they will write me.

Coleman, Texas.

W. A. GRAY.

WATER-COOLED MARMON MODEL H TOURING CAR.

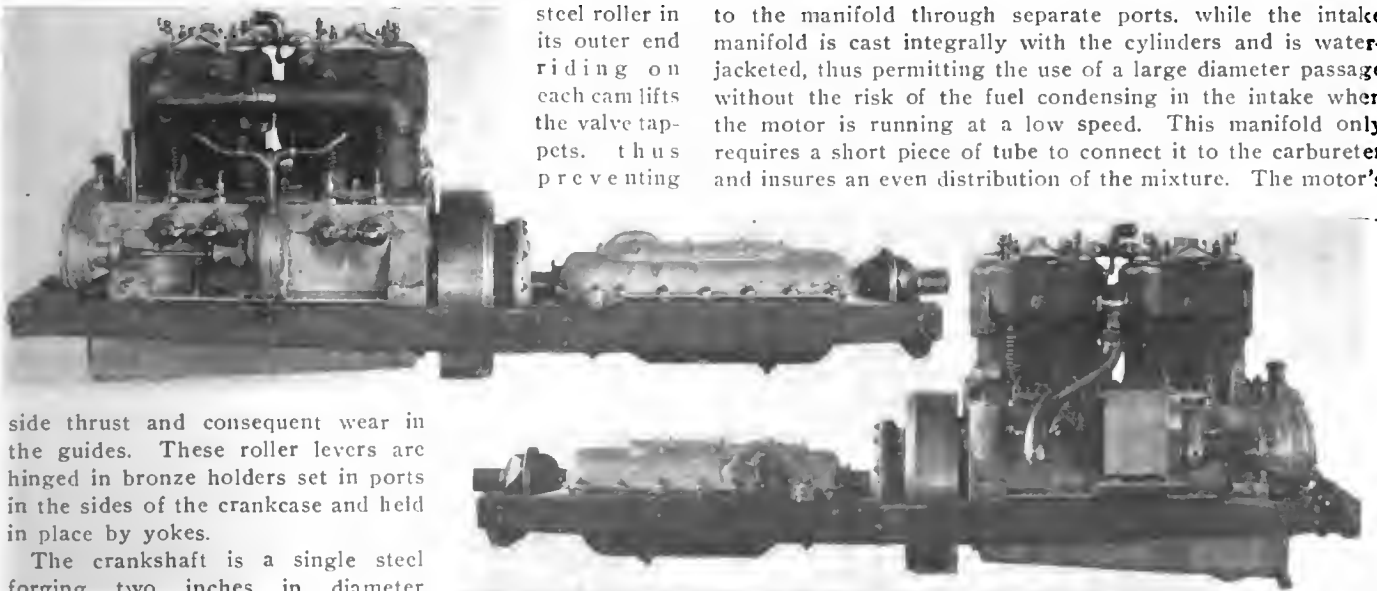

IN adding a water-cooled car to its line for the season of 1908, the Nordyke & Marmon Company, Indianapolis, Ind., is simply making a bid for the business of that large class that prefers a water-cooled type of motor. The success of the Marmon air-cooled car ever since it has been on the market speaks for itself, and the builders will devote more attention to this line than ever in future, as is evidenced by the improvement in motor design recently chronicled in these columns. This is the adoption of a new form of detachable cylinder head, which is a radical departure from the practice of casting the cylinders in one piece, that has numerous advantages. The numerous distinctive features that have characterized the Marmon air-cooled car have all been embodied in the chassis of the newcomer, so that there will be no difficulty of identifying either type as a Marmon product at first sight.

The new car is known as the Model H, and is equipped with a four-cylinder motor in which the cylinders measure 5 by 5 inches, and are cast in pairs. A special grade of iron is employed, and liberal water spaces have been provided, while the water piping is also of ample diameter, circulation being by means of a gear-driven centrifugal pump. The valves have a clear opening of 2 1-4 inches diameter and are made with taper seats, all being interchangeable. Particular attention is paid to the valve mechanism, a hinged lever with a

hardened steel roller in its outer end riding on each cam lifts the valve tappets. thus preventing

side thrust and consequent wear in the guides. These roller levers are hinged in bronze holders set in ports in the sides of the crankcase and held in place by yokes. The crankshaft is a single steel forging two inches in diameter with a flange made integral on one end to receive the flywheel. The shaft itself is hollow and is mounted on Parsons white brass bearings of liberal dimensions. The connecting rods are drop-forgings and the pistons are made very long in order to give a smooth-running motor at high speeds and prevent excessive side thrust against the cylinder walls due to the short connecting rods, the latter measuring 13 1-2 inches while the pistons are 7 1-2 inches long. The connecting rod big-end bearings are also made large and of the same material as the main bearings. A feature that adds greatly to the structural strength of the motor is the carrying of the cylinder fastening bolts through the crankcase so that they also form the crankshaft bearing cap bolts, thus tying the cylinders and the crankshaft together with steel. These bolts are, in reality, studs held permanently in place, so that the removal of the cylinders does not disturb the bearings, or vice versa. The nuts holding the bearing caps are set up against steel plates and not against the aluminum of the crankcase. Cooling is provided for by an improved type of cellular radiator with a large belt-driven fan directly behind it.

Two complete and entirely independent systems of ignition are provided, a high-tension magneto with the spark plugs set over the intake valves forming one, while a timer and four-unit coil supplied with current from a set of batteries and sparking through plugs set over the exhaust valves completes the other system. The exhaust gases are carried to the manifold through separate ports, while the intake manifold is cast integrally with the cylinders and is water-jacketed, thus permitting the use of a large diameter passage without the risk of the fuel condensing in the intake when the motor is running at a low speed. This manifold only requires a short piece of tube to connect it to the carbureter and insures an even distribution of the mixture. The motor's

RIGHT AND LEFT HAND VIEWS OF THE MARMON UNIT POWER-PLANT.

side thrust and consequent wear in the guides. These roller levers are hinged in bronze holders set in ports in the sides of the crankcase and held in place by yokes.

The crankshaft is a single steel forging two inches in diameter with a flange made integral on one end to receive the flywheel. The

FORWARD VIEW OF THE NEW MARMON WATER-COOLED MOTOR.

rating is 40-45 horsepower, but as numerous brake tests have shown results considerably in excess of this, it does not represent its actual capacity by any means.

A multiple disk clutch of exclusive design is employed as an intermediary between the motor and the change-speed gear-set, all three of these essentials being combined in the form of a unit power plant, as shown by the accompanying photographs. The clutch consists of several bronze plates thickly studded with cork inserts faced on both sides, and alternate steel plates. The disks are inclosed in a case secured to the flywheel and run in oil. A series of coil springs engage the disks and small supplementary springs aid in disengaging the disks, when the pressure is released. It is designed to have considerable excess capacity over that of the motor and transmit the power in an extremely smooth manner. The gear-set is of the sliding type operating on the selective plan and providing three speeds forward and reverse. The pinions and their shafts are made of special steel subjected to heat treatment, and are mounted on larger annular ball bearings inclosed in an oil-tight and dust-proof aluminum case. A simple, automatic locking device placed on the outside of the housing makes it impossible to shift the gears without first disengaging the clutch, and it also insures the full meshing of the gear teeth before the clutch can be let in. A simple brake is also automatically applied whenever the clutch is released in order to slow it and the gear shaft so as to facilitate gear changing; this brake naturally does not affect the speed of the car.

Where the remainder of the car is concerned, it suffices to say that it is distinguished by the numerous features of design and construction that have become familiar through their long, successful use on the air-cooled Marmon. Some

SOME OF THE CHIEF ESSENTIALS OF THE MOTOR.

of these are the double three-point suspension in which the motor is carried on one frame and the weight of the car on another, both being free to respond to every inequality of the road; the Marmon oiling system and roller-bearing steering column, cast aluminum body and the like. The Model H. is listed as a five or seven-passenger touring car, and also as a roadster carrying either two or four passengers. The chassis of the latter is built especially for it as a roadster type and embodies the latest ideas of design.

CONTINENTAL PRODUCES IN THREE COUNTRIES.

PARIS, Jan. 7.—The latest important addition to the automobile city which has sprung up and is still growing fast on a bend of the Seine outside Paris is a model factory for the Continental Tire Company. Six large shops, constructed of reinforced concrete, will, when completed, employ two thousand workpeople in the production of automobile and bicycle tires, rims and tissue for balloons. M. Bader, the commercial manager, declares that the works will be fully completed and turning out tires by October next.

In addition to the home factory at Hanover, Germany, the Continental has now two foreign factories of consider-

EXHIBIT OF CONTINENTAL TIRES AT RECENT IMPORTERS' SALON.

able importance, the one in the suburbs of Paris and another in Massachusetts, where a portion of the American demand is met. The Hanover factory, together with the subsidiary house at Seelze, employ 6,700 workpeople, said to be the largest number engaged by any single tire-making concern. The home factory was established in 1872, long before the automobile industry had been created, the American factory dates from 1907 and the French house will come into operation in 1908. The full line of goods handled by the company will be produced at both Paris and Hanover, the American works not yet being sufficiently extensive to meet all demands in the United States.

The making of demountable rims is now forming a very important feature of the Continental factories, this time-saving device, first tested in important racing events in 1905, being declared to be the pioneer of rims of this class. Another important branch in the Hanover factory is the fabrication of rubber tissue for balloons and airships. Important among the envelopes made by Continental was that of the ill-fated French military dirigible *Patrie*, the most successful airship ever built. It is expected that this branch of the firm's activity will be well developed at the new French factory, there being a greater demand for balloon tissue in France than anywhere else in the world.

IN THE MAKING OF A ROLLER BEARING

Probably there is nothing quite so difficult for the lay mind to grasp as the number of processes and operations that are essential to the production of even the most simple mechanical devices. Take a roller-bearing, for instance—whether considered as a whole or separated into its components, there is nothing complicated or intricate about it, and, offhand, the average man would be of the opinion that it was a correspondingly simple and easy thing to manufacture, particularly in quantities. Nothing could more effectively dispel such a notion than a trip through the plant of the Timken Roller Bearing Axle Company, at Canton, O., but as such opportunities come to few autoists, a brief review of some of the more important steps in the evolutions of the well-known anti-friction bearings made by this company will be of considerable interest.

All manufacturing naturally begins with the selection of the material, and errors in this important preliminary are not only irremediable, but become magnified in the process of evolution, so that lack of due care at the outset would be apt to render the finished product worthless. After years of experience and experimenting, the Timken company settled upon an open-hearth nickel steel, low in sulphur and phosphorus, as the best material

GRINDING TIMKEN TAPER ROLLERS ON AN AUTOMATIC MACHINE.

for the rollers of their bearings. This is made to the Timken analysis and 45 per cent. of each ingot is "cropped" or rejected, in order to insure metal of suitable density and soundness. As the roller-bearing carries its load equally distributed at all contact points, all the rollers in the same bearing are subjected to an equal amount of wear, so that it is of the greatest importance that all should wear alike, uniformity of material being essential.

Though these preliminary steps are of vital importance and comprise not a little of the cost of the finished article, they are of secondary interest to the average layman, who is chiefly concerned in the machine work involved—the actual production of the bearings themselves. As is naturally to be expected in a plant of such size, every operation is carried out on a scale designed to lower the cost of production to a minimum. Compared with the price at which these bearings are sold in the market, the expense of duplicating one of them in an ordinary shop by the usual methods would cost an utterly prohibitive sum. Consequently, automatic machinery and the latest modern methods are to be found as the basis of every one of the operations through which the different parts pass. For instance, the first step after the material emerges from its various tests, is the making of the rollers, cups and cones, which are all turned out on automatic screw machines, designed to work the special Timken steel in the forms of rods and bars up to six inches.

SPECIAL MACHINE FOR GRINDING ROLLER-BEARING CUPS.

At first glance, it might seem that examination, testing and assembling would mark the end of the process and that the bearings would then be ready for service, but this is far from being the case. After being finished to shape and size, these parts are first carbonized by packing in a special carbonizing compound, consisting of animal charcoal, in iron boxes, which are heated in special furnaces and subsequently allowed to cool slowly. The parts are next heated in automatic revolving gas furnaces so that each piece of metal passing through them is subjected to the same degree of heat. From this second furnace they are suddenly quenched in oil in order to give the outside surfaces the requisite combination of hardness and toughness—in other words, qualities which fit them to withstand crushing loads as well as wear. The first process is generally known as case-hardening, for which a battery of special furnaces has been installed at the Timken plant, and the second as oil-tempering.

Here again, it might be thought that the process had now come to an end, and that only the final operations of assembling and testing remained, but it is only after the operations already described have been gone through that the most delicate part of the work of producing such bearings comes in. The hardening process referred to always causes more or less distortion of the parts, which have previously been machined closely to dimensions, but as yet have not been brought to that degree of absolute accuracy that is essential to the successful production of such a device as a properly designed anti-friction bearing. To attain this by counteracting the slight warping effect of the hardening furnaces and to get the parts down to micrometer gauge, they are placed in special grinding machines. Owing to the extreme accuracy required, as well as the fact that as little as possible

SORTING TIMKEN ROLLERS AFTER THE FIRST GRINDING.

ASSEMBLING THE FINISHED AND TESTED PARTS.

MICROMETER GAUGING THE ROLLERS FOR .002-INCH VARIATIONS.

of the specially hardened surface should be ground away, this is an operation requiring special machinery and more than the usual skill on the part of the machinist. The taper rollers are finished on automatic grinding machines.

Throughout every detail of all these various processes, however, nothing is left to chance or rule-of-thumb work. Each succeeding lot of materials, and the parts into which it is transformed, is closely watched as it progresses through the different stages. In the converting boxes, 12 rollers are wired together

ESSENTIALS OF THE COMPLETED TIMKEN ROLLER-BEARING.

and packed in the center of each box that goes into the case-hardening furnace. These 12 rollers are test specimens, and on the completion of the heat are taken to the laboratory, where they are broken and the fractures etched with acid to determine the depth of the case-hardening—or in other words, the conversion of the surface of the parts into high-carbon steel. In this manner uniformity is insured to the greatest degree possible. After the grinding process has been completed, the finished rollers go to a tester where they are gauged for uniformity of diameter in order that only rollers very closely approximating

one another in diameter at the center of the load-carrying surface, should be assembled in the same complete bearings. A difference of .002 inch causes the rollers to go into different boxes.

While these operations are being carried on in different departments of the large plant, the other essentials of the bearing are being turned out simultaneously. The cages and cage-rings are turned out in special machines, the latter being stamped and pierced in power presses. These cages carry no part of the working load, but are designed to give the individual rollers absolute freedom of travel between the cone and the cup. The rollers and cage-rings are next brought together at an ingenious riveting machine which combines the two into a circle of conical rollers loosely retained laterally by the cage-rings and studs, but accurately positioned endwise in the complete bearing assembly by the cone ribs, coacting with the roller grooves, so that each roller has the same load carrying apportionment when working. This is the next to the last step in the actual manufacturing, which consists of the assembling. After having gone through all these lengthy and intricate processes, of none of which the appearance of the simple device gives the slightest hint to the uninitiated, the original material has been converted into the finished roller-bearing. It is a product as perfect as the skill of the metallurgist, the chemist and the expert machinist, aided by modern machinery and methods, can make it, but all of this would constitute a recommendation of doubtful value to the user, if he found that the bearings gave out in actual service. Accordingly, science, skill and care are supplemented by actual trials of bearings from successive lots. These are placed in a special testing machine and subjected to stresses far beyond what they will ever be called upon to bear in actual service, so that their capacity for work is well established.

AN EARLY "OLD" ARRIVAL AT ORMOND-DAYTONA, FLA.

A FINE POINT IN CUSTOMS COLLECTION.

WASHINGTON, D. C., Jan. 13.—The United States Supreme Court has been asked by the Attorney General to decide whether the owner of an automobile of foreign manufacture can be required to pay duty on the machine a second time when it has been kept abroad for a year and extensively repaired. The United States Circuit Court of Appeals for the Second Circuit held that duty could be collected only on the new part of the machine, but the government contends that it should be paid on the entire article.

MR. MILTOUN RECEIVES TUNISIAN DECORATION.

Francis Miltoun, a frequent contributor to THE AUTOMOBILE, during his last journey in the Regency of Tunis was decorated and made an "Officier du Nichan Iftikhar" by the Bey of Tunis, for exceptional services, as the "brevet" reads.

Mr. Miltoun has voyaged much *en automobile* through Europe, and has exploited many hitherto unheard-of or neglected beauty spots among all classes of travelers. His last book, "In the Land of Mosques and Minarets," is now in the hands of his publishers (Messrs. L. C. Page & Company, of Boston).

Mr. Miltoun promises THE AUTOMOBILE an article in the near future on "Roads and Roadmaking Abroad," which, with the latest information concerning the art of modern road building as pursued in the French colonies and protectorates of old Africa, should make interesting reading.

The hotel accommodations in Tunisia are by no means backward, as the photograph sent by Mr. Miltoun plainly shows.

MR. MILTOUN AND HIS CAR IN FRONT OF TUNISIAN HOTEL.

Knowledge the Chief Requirement of the Legislator. "One man can lead an ass to knowledge, but ten men cannot make him think," is an apt way of paraphrasing the familiar saying that is very appropriate at the moment. Leaving out of the question the strength of such ulterior influences as "constituents" and "perquisites" in deciding the passage of legislation adverse to the automobilist and the industry, it stands to reason that if the average rural "Solon" could be reasoned with and made to think a bit he would not declaim quite so loudly about downing the automobile and taxing the "rich owners" to the limit. Eighteen months' enforcement of the obnoxious Frelinghuysen law shows that by its non-reciprocal provision it has done more harm to the State of New Jersey as a whole than the money received from the extra licenses taken out can possibly compensate for. The matter of amending it in this and other particulars is now being broached, and, if the Jersey legislators can be made to think a bit, there should be no difficulty in bringing about this result.

It would be hard, indeed, to cite a better example of the beneficent effect of having some knowledge of a matter which has to be regulated by law than Mayor McClellan's recommendations to the metropolitan aldermanic body regarding the control of automobiles in New York City. With the constantly increasing number of cars in the streets of the metropolis, small things that were scarcely noticeable a few years ago have assumed the proportions of decided nuisances. Chief among these are the production of clouds

of lubricating oil smoke, the constant use of sirens, and the blinding glare of large acetylene headlights at night, and in his message the Mayor laid particular stress on each one of them as something which should be forthwith abolished. If the average legislator would gain a little knowledge of the automobile and be guided by it, there would be a noticeable absence of abortive attempts at legislation.

Commercial Drivers Need Not Be Skilled Mechanics. Because a French newspaper was offered the use of a taxicab company's vehicles to hold a breakdown competition open to all, but attracting no drivers of public cabs, an effort has been made in certain quarters to prove the usefulness of more skilled training for the men who are fast superseding the public hackman. A man who can adjust the platinum points on a magneto and time the ignition of a strange car in 11:18; discover and remedy a short circuit in the magneto in 1:28; discover that the carbureter nozzle had been stuffed with paper, remove it, and have his car going in five minutes—a man who can show such a record should be ashamed to be driving a taxicab. Cab companies, indeed, cannot afford to keep such men at the comparatively unskilled task of steering a small automobile rendered as automatic as it is possible for human ingenuity to make it.

Just as in modern factory practice, where a four-loom weaver knows little and cares less of the structural features of her machine, or the linotype operator confines his attention to the keyboard and the output of slugs, so the taxicab has created a demand for a class of men who may be thoroughly capable of running a car without knowing much about the operations under the bonnet. Every operating company, without exception, insists that its men shall not tinker. Their duty is to run the vehicle according to instructions, and if it fails to perform in a normal manner, to call for expert aid. Commercially it is quite impossible to operate any large number of automobiles except by employing unskilled or semi-skilled labor. No company can afford to employ an expert for each machine, and still less to keep tinkers in its service. As the horse is gradually ousted from the commercial world, there will be an increasing demand for men who are nothing more than drivers.

An Achievement the A. C. A. May Well Be Proud of. If, in its long career, the Automobile Club of America had not succeeded in accomplishing anything more than the successful installation of the Wheeler dynamometer, the completion of which was made the subject of a public demonstration at the large clubhouse in Fifty-fourth street last week, it would still deserve to have its name go down in history as having been the most progressive organization of its kind in this respect. There have been dynamometers of one kind or another ever since there has been anything which developed enough power to make its measurement a matter of sufficient curiosity to its builder or owner, and as was naturally to be expected, many of them have been utilized in connection with the automobile, but neither here nor abroad has there ever been such an elaborate and costly installation made for the purpose.

Large manufacturing interests occasionally go to great expense in fitting up laboratories and testing rooms to further the improvement of their own products, but even in such cases the outlay seldom exceeds that necessary to devise such an elaborate and costly assemblage of apparatus as that now permanently installed on the top floor of the Automobile Club of America's house, and which may be taken to have been designed, not merely for the benefit of the club members alone, but for that of the entire industry.

WHAT THE LEGISLATIVE BOARD OF THE A. A. A. IS DOING

CHAIRMAN CHARLES THADDEUS TERRY, of the Legislative Board of the American Automobile Association, at the recent meeting of the executive committee of the national organization, presented a report which contained much material of great moment to automobilists generally. In the course of his report Chairman Terry commented as follows:

First.—The Federal Automobile Law.—Arrangements were completed by your Board with Honorable William W. Cocks, congressman from the State of New York, for the reintroduction of the bill prepared by your committee in its effort to secure a system of Federal registration and identification of automobiles, to the end that the annoyance of the varying State requirements in these regards might be eliminated. This was so thoroughly and so promptly accomplished that this Federal bill was introduced on the very opening day of the present session of Congress, to wit, the Sixtieth Congress. The bill is known as House Bill Number 428, and was referred to the Judiciary Committee of the House. The list of the members of that committee has only recently been completed by the Speaker of the House, and forthwith upon their appointment the chairman of your committee procured from Washington the names and States respectively of the members of the committee, and here sets them forth, so that they may be on record for future reference, because your committee, and, we hope, every member of this association, will make occasion to have much to do with the said committee, both collectively and individually, before the close of the present session:

COMMITTEE ON THE JUDICIARY OF THE HOUSE OF REPRESENTATIVES.

John J. Jenkins, Chairman,	Chippewa Falls,	Wisconsin.
Richard Wayne Parker,	Newark,	New Jersey.
DeAlva S. Alexander,	Buffalo,	New York.
Charles E. Littlefield,	Rockland,	Maine.
Charles Q. Tirrell,	Natick,	Massachusetts.
John A. Sterling,	Bloomington,	Illinois.
John H. Foster,	Evansville,	Indiana.
Henry T. Bannon,	Portsmouth,	Ohio.
Reuben O. Moon,	Philadelphia,	Pennsylvania.
Gerritt J. Diekema,	Holland,	Michigan.
George R. Maiby,	Ogdensburg,	New York.
Henry S. Caulfield,	St. Louis,	Missouri.
David A. DeArmond,	Butler,	Missouri.
Henry D. Clayton,	Eufaula,	Alabama.
Robert L. Henry,	Waco,	Texas.
William G. Brantley,	Brunswick,	Georgia.
Charles C. Reid,	Morrilton,	Arkansas.
Edwin Y. Webb,	Shelby,	North Carolina.

Your Board is now engaged in the preparation of letters to be sent out from the office of the association to all the clubs enrolled in the association and to each individual member of the association, as well as to any and all friends of automobilists whom we can reach. We feel that no one who will give sufficient time and thought to acquaint himself with this bill can refrain from lending his support to the measure.

The chairman and secretary of your Board expect to meet Congressman Cocks and some others whose assistance is of importance in this regard in Washington within the next ten days to further the interests of the bill.

Second.—State Motor Vehicle Laws.—The outlook for sane and reasonable State laws concerning automobiles is exceedingly good,

with the prospect of the ultimate enactment by most of the States of our proposed uniform State Motor Vehicle Law very bright indeed. The one disappointing and disagreeable feature in the State law situation is presented by the incomprehensible attitude of the authorities of the State of New Jersey. There are no arguments to sustain their position in support of the obnoxious law on their statute books governing automobiles, except the frankly-confessed one that it provides revenues, and the remarkable part of the situation is that they consider that argument all sufficient. There are two provisions in the New Jersey statute, either one of which is sufficient to demonstrate the unfairness and the unreasonableness of those who advocated the passage of the measure, and both of which should elicit the hearty condemnation of every lover of fair play, whether he is an automobilist or not. Those provisions are, in a word:

(a) That a non-resident automobilist engaged in interstate travel shall not be allowed to cross a border of the State of New Jersey until he has made a trip to Trenton, paid his tribute to the State, with the emphasis on the tribute, and procured his license to exercise his natural common-law right to use the highways; and

(b) That no automobilist may traverse the streets or roads of this sovereign State of New Jersey until he has subjected himself to the humiliation of appointing as his attorney in fact a man whom he does not want to represent him, and whom he perhaps never heard of.

The law is an outrageous one, and unworthy of any self-respecting commonwealth. Every effort of the American Automobile Association and its friends should be bent to wipe from the statute books of that State this monstrous curtailment of the rights of users of the highways. So long as those provisions remain in force, every automobilist should be warned against entering the State of New Jersey and deterred from submitting himself to the indignities perpetrated by the statute of that State, and should be advised to take his tours in other sections of the country, where he can get just treatment. If the only argument for the State statute is that it produces revenue, let that argument be demolished by a demonstration that, deterring automobilists from entering the State of New Jersey, will result in a loss of a thousand dollars of money spent and left within that State for every dollar that would be paid by non-residents for license fees. This is one of the effective ways, and perhaps the most effective way, of dealing with that situation at present.

Third.—Local Ordinances.—The danger to be incurred by automobilists in deprivation of their rights, from any recurrence to the anciently asserted privilege of municipalities and other local bodies to pass ordinances of regulation to suit themselves, is obvious, and clearly a great menace. Every such attempt at the promulgation of such ordinances should be struck at by this association wherever it appears. It was supposed, and justifiably so, that when that question was once threshed out in connection with the passage of the New York State Motor Vehicle Act, it had been settled for all time; but it remained for the Park Board of the City of New York to revive it in spite of the clear prohibition of the New York State statute, and in spite of all considerations of reasonableness and equality. Common-sense, the safety to the traveling public, others as well as automobilists themselves, justice and the laws upon our statute books require that the New York City Park Board should frankly and speedily recognize its error and repeal its misconceived ordinance.

NEW JERSEY'S AUTO CLUBS TO WORK FOR A SANE LAW

NEWARK, N. J., Jan. 13.—The chief result of the meeting of the Associated Automobile Clubs of New Jersey at Trenton, N. J., last week was the passing of a resolution that W. F. Sadler, Jr., president of the associated clubs, appoint a committee to confer with Senator Frelinghuysen and others interested in the automobile law, with a view to arriving at an agreement concerning the amendments which are to be supported at the next session of the legislature. This conference will probably take place some time this month, and to it will doubtless be invited, in addition to the bill's original sponsor, Commissioner of Motor Vehicles J. B. Smith, and representatives of the grangers' and farmers' organizations, so that a complete understanding may be reached.

According to some of the press reports of the proceedings, it was stated that the delegates "voiced certain demands" to be presented to the legislature, but W. Clive Crosby, chairman of the legislative committee of the New Jersey Automobile and Motor Club, who, with J. H. Wood, represented the Newark organization at the conference, denied this emphatically.

"The intention of the meeting was not to make any demands, but to formulate the ideas which automobilists all over the State agree upon as being fair and recognized as such by all those who have carefully studied the subject," said Mr. Crosby to a representative of the *Sunday Call*.

"There was no mention made of saving the State \$30,000

by the abolishment of the personal license fee, as was reported in the daily papers. We did talk over plans for saving in the administration of the automobile law, but when we discussed the subject of personal license, it was simply from the standpoint that the personal examination, so-called, as now conducted, is a farce, as every motorist who has applied for a license knows. What we desired was that a man in New York State, for example, should be able to apply by mail direct to Trenton and obtain a license without going through the formality of applying in person at one of the offices of the deputy commissioners throughout the State.

"The spirit of the meeting was entirely harmonious and the

opinions expressed similar to those voiced at the meeting in Newark in December."

Those who attended as delegates the conference in Trenton last week were: New Jersey Automobile and Motor Club, W. C. Crosby and Joseph H. Wood; Northern New Jersey Automobile Club, Paterson, George A. Post; Automobile Club of Hudson County, Jersey City, J. H. Edwards and J. V. Z. Anthony; Union County Automobile Club, Plainfield, Dr. F. C. Ard; Mercer County Automobile Club, Trenton, W. F. Sadler, Jr., and James E. Gill; Atlantic City Automobile Club, Walter Edge; Camden Automobile Club, Mr. Sparks; Wildwood Automobile Club, Mr. Hammersley.

NEW YORK STATE MAY HAVE NEW LAW AND ANNUAL FEE

ALBANY, N. Y., Jan. 13.—The special legislative committee of the New York State Automobile Association, appointed by President Oliver A. Quayle, held a session in Albany on Wednesday last. Present at the session, besides the State president, were William H. Hotchkiss, of the Automobile Club of Buffalo; S. M. Butler and W. W. Niles, of the Automobile Club of America; Russell A. Field, of the Long Island Automobile Club; H. S. Stilwell, of the Syracuse Automobile Club; Charles T. Terry, chairman of the A. A. A. Legislative Board; Frederick H. Elliott, secretary of the A. A. A.; A. G. Batchelder, New York City; Chauncey D. Hakes, secretary of the State Association, and Howard Martin, of the Albany Automobile Club.

The legislative situation was gone over thoroughly, and the final results will be made public in due course of time. Messrs. Terry, Quayle and Niles were designated as a sub-committee to complete the work outlined by the special committee.

Chairman Terry Discusses an Annual Registration Fee.

Interviewed by a New York *Times* reporter, Chairman Charles Thaddeus Terry, of the A. A. A. Legislative Board, commented as follows upon the proposed new New York State law, which will contain provision for an annual registration fee:

"The prime reason for enacting an annual registration fee based upon the weight or horsepower of the cars is due to a general dis-

position on the part of motorists to do their share for the maintenance of good roads. The fee will not be recognized as a tax upon motor vehicles, for motorists are not disposed to acknowledge that they should be taxed exclusively for the use of the public highways, but they are willing to contribute their share of funds toward the good roads movement. Another important change will be in regard to speed regulations. In this respect we hope to embody the simple regulations of the uniform State act, which have been adopted in the Connecticut Automobile act, the most reasonable State motor law in the country.

"This states briefly that no person shall operate a motor vehicle at a rate of speed greater than is reasonable and proper, having regard to the width, traffic, and the use of the highway, and the general rules of the road, or so as to endanger property or the life and limb of any person. If it is necessary to state any specific speed rate beyond which the safety of other users of the road is likely to be endangered, a maximum of over twenty-five miles an hour in municipalities or built-up sections, when continued for half a mile, will be considered proof of negligence, and in the country a speed of over thirty miles an hour. The present New York law limits the speed rate to ten miles in thickly populated portions, fifteen miles in other localities, and twenty miles in the country. Under certain conditions these limitations are much too low, while in other cases they are too high, for an autoist in many parts of New York City would clearly be driving recklessly at six miles an hour, while in the open country he might readily travel forty miles an hour with perfect safety."

The uniform motor vehicle law, the basis of the proposed new New York statute, was prepared by the A. A. A. Legislative Board and imposes a different system of penalties than is now in vogue in the New York law.

BUFFALO CANNOT IMPOSE ANNUAL TAX.

BUFFALO, N. Y., January 13.—Members of the Automobile Club of Buffalo are particularly pleased at a decision handed down by the Appellate Division of Rochester declaring unconstitutional and invalid the ordinance adopted by the Common Council of Buffalo imposing an annual tax of \$5 on all automobiles using the thoroughfares of Buffalo. This ordinance was enacted early last year, and all members of the Automobile Club were immediately advised by Secretary D. H. Lewis not to pay the tax, as the club had engaged former Supreme Court Justice Daniel J. Kenefick to attack its validity. Some, however, did pay the tax. The Municipal Court in this city decided against the municipal authorities, but an appeal was taken to the Appellate Division. The courts hold that the local measure conflicts with the State motor vehicle law.

CHAINS QUESTION SPREADS TO QUAKERVILLE.

PHILADELPHIA, Jan. 13.—At last Thursday afternoon's session of the Fairmount Park Commission, a movement was started to exclude from the park any automobile having tires fitted with chains. Final action was not taken in the matter, which was referred to the Committee on Superintendence and Police.

NEW YORK'S AUTO LEGISLATORS AT WORK.

ALBANY, N. Y., Jan. 13.—In the Assembly to-night two old anti-motor vehicle bills in a little different dress appeared. One was by Assemblyman Frederick Northrup, a Democratic printer of Poughkeepsie, who declares the big touring cars "cut the improved highways all to pieces." It is the old tax bill and amends the present motor vehicle law by calling for \$5 annually from each owner.

Another Democrat, a very new Assemblyman, a law student and clerk, representing the Twentieth District of Manhattan, Patrick J. McGrath, calls for an amendment to the penal code, which provides that "any person or persons, while conducting, managing, operating, or riding in an automobile, carriage, vehicle, or any other conveyance, who shall come into contact with, or in any way injure any person or the property of another, shall immediately stop, and, upon demand, give his true name and address, and the names and addresses of the person or persons to whom such automobile or conveyance belongs, and by whom such person is employed, to the person injured, or to the first policeman on the scene, or to any citizen present; and in default of same shall be guilty of a misdemeanor and upon conviction shall be punished accordingly."

This seems to apply to street cars as well as to automobiles, and its phraseology indicates the amateur draftsman.

A.A.A. CLUBS ACCOMPLISHING MUCH THESE DAYS

RESTFUL POLICY OF A. C. OF PHILADELPHIA

PHILADELPHIA, Jan. 13.—The policy of the Automobile Club of Philadelphia is to assist the authorities wherever possible in the suppression of the unlawful use of the automobile. In this connection the club's action in relation to an accident which recently occurred in Lower Merion township, Montgomery county, makes interesting reading. Its example could be taken with profit by other clubs. Following is a copy of a letter which was sent to the authorities of Lower Merion township on the occasion mentioned:

Philadelphia, January 7, 1908.

Honorable Algernon B. Roberts, State Senator,
Philadelphia, Pa.

My Dear Senator Roberts:—

The Automobile Club of Philadelphia has instructed me to write and express to you, as representing Lower Merion Township, its approval of your course and its desire to co-operate with the authorities in every possible way in your efforts to discover the identity of the automobile driver who ran down a boy on Montgomery avenue, in Lower Merion Township, a few days since, and after injuring him severely drove off so rapidly as to prevent discovery. This organization is strongly opposed to the driving of machines at dangerously high speeds and to all forms of recklessness. The automobile club does not wish to prejudge a man or condemn him unheard, and does not therefore desire to be understood as expressing any opinion as to the guilt or responsibility for the accident in this case; but it does feel that the manly and wisest thing for a driver to do, under such circumstances, is to stop, give his name and render what assistance is possible.

We are, therefore, desirous to advise you that if the commissioners of Lower Merion Township deem it advisable, the Automobile Club of Philadelphia will be glad to add the sum of fifty dollars to the reward already offered by the commissioners for evidence leading to the discovery of the driver, whose automobile was concerned in the accident above referred to. It is our wish that you use your discretion in advertising this offer of reward, and we hold ourselves in readiness to pay it over to whomever you may designate upon advice from you.

Respectfully yours,

A. N. CHANDLER, President.

S. BOYER DAVIS, Secretary and Counsel.

A check for \$100 sent to the Automobile Club of Delaware County to assist that organization in its efforts to secure the co-operation of the farmers in bringing about the improvement of the main country roads, is another indication of A. C. of Philadelphia methods. That they are on the right track, is the opinion of all right-minded automobilists. At the same time they are prepared to fight extortion and injustice from the drop of the hat, as not a few of the borough and township officials of the country roundabout can bear witness, after legal encounters in which they were worsted.

BUFFALO CLUB 1,127 AND STILL GROWING.

BUFFALO, N. Y., Jan. 13.—The membership of the Automobile Club of Buffalo is now 1,127, and in an appeal to members the newly elected president, Frank B. Hower, makes the following statement: "When the members of this club come to realize that our strength in controlling automobile legislation, both in the city and at Albany, depends upon the size of our membership, they will make it their business to influence every friend owning an automobile in becoming a member of the club. Remember when working for members you are working for yourself, for your influence is more powerful because your club is larger. We have now 1,127 members—let us make it 3,000. If each one will appoint himself a committee of one on membership and work, as you do in your business, the result will be astonishing. I assure you that the officers of this club are watching your interests."

The executive committee of the club consists of President Hower, E. R. Thomas and Charles Clifton.

MARYLANDERS WILL CONTEND FOR SANE SPEED

BALTIMORE, Jan. 13.—At the second annual banquet of the Maryland Automobile Club, which was held at the Hotel Belvedere last Thursday night, plans were launched for the erection of a new clubhouse. As proposed, the plan includes the erection of a building with the first floor to be rented as offices and stores. One of the sites under consideration is that occupied by the old Baltimore & Ohio Railroad building at the corner of Baltimore and Calvert streets. One of the features of the new building would be a general dining room for members.

Osborne I. Yellott presided over the banquet and acted as toastmaster. The banquet hall was as though seen through green colored goggles. The tables, in the form of a gridiron, were splashed here and there with the color of blood red tulips and Jacqueminot roses, showing bright against the snow white linen, like rear lamps of a huge touring car. The menu card was calculated to maintain the reputation of the members of the club for originality. The souvenirs were badges of black and yellow ribbons (the Maryland colors) falling from a gold model of a touring car, and from the colors dangled an auto wheel, the hub of which was a brilliant red. The wheel was of gold and made an excellent watch charm.

Among those who responded to toasts were Mayor J. Barry Mahool, who talked of "Greater Baltimore and the Automobile," saying that the automobile was a great factor in the upbuilding of the suburbs. Other speakers and their toasts were: Water Engineer Alfred M. Quick, "The Water Wagon and the Automobile;" State's Attorney Eugene O'Dunne, "Crime and the Automobile;" Chief Engineer of the State Highway Commission W. S. Crosby, "Good Roads and the Automobile;" Milton D. Greenbaum, "The Ladies and the Automobile;" William D. Gill, "Alcohol as a Fuel and Otherwise." Covers were laid for 150.

In the course of his remarks, Mr. Yellott said that the legislative committee of the club would propose an amendment to the speed laws at this session of the legislature abolishing the present limit and substituting a discretionary limit to be determined by the condition of the roadway. He urged the abolishment of toll roads and the construction of State highways, and placed the club on record as favoring a Federal license for automobiles. The use of cars by drunken chauffeurs or owners was soundly scored, and promise was made to secure legislation on this point. Lastly, he declared that the club would endeavor to secure a State commission for the government of automobiles and the issuing of licenses.

A. C. A. BANQUET WILL BE NOTABLE EVENT.

NEW YORK, Jan. 13.—The annual banquet of the Automobile Club of America, to be held in the Fifty-fourth street clubhouse on Saturday evening, January 25, will undoubtedly be the most important social event of the season in automobile circles. Instead of holding the banquet at the Waldorf or Sherry's as has been usual, the club is now in a position to entertain its guests in its own headquarters, its banquet hall, finished in the renaissance style of François I, being one of the largest and most beautiful in the country. The gathering will, in a certain sense, be a formal celebration of the completion of the finest and most up-to-date automobile club premises in the world.

As a tribute to the fact that France is the birthplace of the modern automobile, M. Jules Jusserand, Ambassador of the French Republic, will be the guest of honor, while the other

speakers include the Hon. Chauncey M. Depew, Augustus Thomas, Hon. Job N. Hedges, and Patrick Francis Murphy.

As Delmonico has charge of the catering, this year's feast will undoubtedly prove worthy of its superb setting. The seating capacity of the hall being limited to 361 persons, and 300 reservations having already been made, the committee in charge is confident that every seat will be taken before January 16, when the lists close. The committee in charge of the banquet is composed of A. R. Shattuck, chairman; Dave H. Morris, and Orrel A. Parker.

ANNUAL BANQUET OF NEW JERSEY'S BIG CLUB.

NEWARK, N. J., Jan. 13.—Among the guests of honor at the annual banquet of the New Jersey Automobile and Motor Club, to be held February 6, probably at Achtel Stetter's, will be William H. Hotchkiss, president of the American Automobile Association, and Commissioner J. B. Smith, head of the department of motor vehicles. During this week invitations will be sent out to other prominent men who have informally expressed their willingness to be present.

Arrangements for the Newark automobile show in February, to be held under the auspices of the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association, are now well advanced. Application blanks for space were issued last week, and returns are expected within the next few days.

ANNUAL BANQUET OF THE BINGHAMTONIANS.

BINGHAMTON, N. Y., Jan. 13.—The second annual dinner of the Binghamton Automobile Club, which was held last week at the Armory Hotel, proved by far the most enjoyable of the social functions so far attempted by that live and hustling organization. Chairman F. P. Barnes and his fellow workers on the entertainment committee laid their plans so carefully that the affair moved without a hitch and gave enjoyment in profusion to the assembled members and their guests. President Benj. F. Weldon spoke in favor of a clubhouse for the organization, and urged renewed efforts to increase the membership, and Secretary S. M. Frechie spoke of the work done in the past and the possibilities of the club's future. Mayor C. M. Slauson spoke for the city of Binghamton, and numerous civic officials were in attendance at the banquet as guests of the club.

CHICAGO M. C.'S ENDURANCE RUN, JUNE 24-27.

CHICAGO, Jan. 13.—Quick action appears to be the watchword of the newly appointed contest committee of the Chicago Motor Club. Although but three days old, it got busy and announces that the feature of the 1908 season will be a 1,200-mile reliability run continuing four days. The dates selected are June 24-27, inclusive, and the rules will require each car to do 300 miles a day, instead of 200 miles, as was required in the 600-mile reliability which was won by the Haynes in 1907. The old "hub and spoke" plan will be adopted, the contestants returning to Chicago each night. The run will come in a few weeks ahead of the Glidden and it is expected will attract many makers who also contemplate taking part in the national tour.

In addition to laying out the "long-distance reliability," the contest committee decided that the campaign of 1908 would be opened in May instead of two months later, as in previous years. The hill climb is the first thing scheduled, for May 15, which has been advanced from second place on the annual card. The economy run is also pushed forward, being booked for August 14 instead of September.

A novelty discussed by the committee was a reliability test for motor buggies. It is proposed to put on a three or four day reliability run for which cars with wheels 38 inches in

diameter and over will be eligible. This will be a continuous test, starting from Chicago and running through the surrounding country for several days.

THE 1908 TOUR OF THE ALBANY A. C.

ALBANY, N. Y., Jan. 13.—The 1908 tour of the Albany Automobile Club will be held, beginning June 20, over the following route: Saturday (the 20th), Albany to Greenfield, Mass., 87 miles; Sunday, to Providence, R. I., 109 miles; Monday, to New Haven, Conn., 126 miles; Tuesday, to New York City, 80 miles; Wednesday, spent in New York; Thursday, to Waterbury, Conn., 92 miles; Friday, to Albany, 103 miles; total mileage, 597.

A committee was appointed to take direct charge of the McClure cup contest, which it was decided at a previous meeting should be over the same route and on the same dates as the club run, though under the supervision of this special committee: John Randerson, chairman; L. Melius, A. J. McClure, Walter Beattie, Dr. F. J. Cox, C. D. Hakes and C. S. Kelly. The club urges all interested persons or owners of machines to affiliate at once with it in order to secure most advantageous legislation on automobile matters.

LEE PRESIDENT OF BOSTON'S ENERGETIC CLUB.

BOSTON, Jan. 13.—Elliot C. Lee, formerly president of the American Automobile Association, and also for many years at the head of the Massachusetts Automobile Club, the pioneer organization of its kind in New England, has been elected president of the Bay State Automobile Association. Mr. Lee succeeds Lewis R. Speare, who has been president since the formation of the association three years ago, and who declined to be a candidate for reelection on account of the pressure of business duties, and because of the time required of him as vice-president of the A. A. A. and chairman of the legislative committee of the Massachusetts State Association. Harlan W. Whipple, of Andover, another ex-president of the A. A. A., was reelected vice-president, and Harry W. Knights and James Fortescue were reelected treasurer and secretary, respectively. The new board of directors consists of George W. McNear, an automobile and carriage body builder; Dr. Julian Hovestadt; Arthur P. Underhill, of the Reed-Underhill company, local agent for the Knox; J. W. Maguire, of the J. W. Maguire company, agent for the Pierce; and J. C. Kerrison. Dr. Hovestadt and Mr. Maguire are the new members. The Bay State Association is making plans for a busy season, and its officers will pay particular attention to legislative matters. The association begins the new year with a large and enthusiastic membership, and seems likely to maintain its leading position among the automobile organizations of New England.

WASHINGTON CLUB RE-ELECTS PRES. CAVERLY.

WASHINGTON, D. C., Jan. 13.—That the Automobile Club of Washington is in a flourishing condition and that it has accomplished a number of things beneficial to the automobilists of this city, was indicated by the annual reports of the officers submitted at a meeting of the club last Saturday evening. In recognition of the splendid services rendered by Robert B. Caverly, the members unanimously re-elected him president for the ensuing year. Secretary Leroy Mark was also honored with an unanimous re-election. Other officers elected were as follows: Vice-president, Harrington Mills; treasurer, Horace Chandlee; captain, F. B. Pyle; lieutenant, John Thomas. H. Chadwick Hunter, Col. C. E. Wood, W. D. West, and Arthur Newmeyer were placed on the board of governors. Steps were taken to increase the membership, and plans were made to carry on the good work of the club.

HARTFORD'S AUTO SHOW MAKES A PROMISING START

HARTFORD, CONN., Jan. 14.—It was a promising opening the show of the Hartford Dealers' Automobile Association had to-night at Foot Guard Hall. The building was artistically decorated, the crowd came in generous numbers, and sales were in progress before the exhibition was an hour old. Each exhibitor had the privilege of decorating his own space as he saw fit, and the result has been some very notable creations. There is not the uniformity seen at most of the shows, and the variety in decorating, as well as in life, seems to lend spice to the show.

Hartford being one of the pioneer automobile manufacturing cities in the country, its advantages are plainly apparent in the holding of a show. Many of the leading makes are on view, local agencies being possessed by many of the prominent concerns. The list includes these well-known names: Packard, Stevens-Duryea, Pierce-Arrow, Thomas, Corbin, Elmore, Atlas, Columbia, Ford, Pope-Hartford, Franklin, Knox, Cadillac, Oldsmobile,

Autocar, Mitchell, Maxwell, Waverley, Reo, Buick, Simplex, and Isotta Fraschini.

Of course the accessory folks are on view, the names including Post & Lester, Jones Speedometer Co., Stewart & Clark Mfg. Co., Lombard Speedometer Company, G. W. Fuller, Vacuum Oil Company, Visor Knitting Company, W. H. Wiley & Sons Company, A. L. Foster & Company, Aetna Life Insurance Company, Hartford Rubber Works Company, Veeder Mfg. Co., and the Bridgeport Vehicle Company.

The men behind the show are R. D. Britton, as president of the Dealers' Association; S. A. Miner, secretary; F. W. Dart, treasurer; and E. G. Biddle as the fourth committeeman.

The banquet of the Automobile Club of Hartford is scheduled for Thursday night, at the Hotel Garde, and is in charge of a committee consisting of C. H. Gillette, H. P. Maxim, F. W. Dart, G. E. Risley, and Walter Wakefield.

GREATER PITTSBURG PREPARING FOR A GREATER SHOW

PITTSBURG, Jan. 13.—Greater Pittsburg—achieved but a few weeks ago—is to have an automobile show worthy of it. Preparations are now going forward rapidly to make the show at the Duquesne Garden, April 4-11, one of the best that has ever been held in this country. The Automobile Dealers' Association of Pittsburg, under whose auspices it will be held, had a meeting last Thursday night and completed all preliminary arrangements for the show. So far they have decided to use more space, spend more money, have more exhibitors, and call in more skilled help in making ready the big exhibition hall than they did at the first Pittsburg show.

PRES. W. N. MURRAY.

Scenic mural decorations of a high order, uniformity in inscriptions and signs, artistic and effective draping of fine material and unsurpassed arrangements in electric displays have already been determined upon. Red and

white will be the prevailing colors. A touch of gold will relieve this combination. The accessory spaces will be more desirably situated than last year, for they will be against the wall and across the aisle from the automobile spaces. The main body of the hall is 340x135 feet, making a larger floor space than in Madison Square Garden, New York.

A handsome directory is now being prepared at the headquarters of the association. Prominent among the facts which it presents are these: There are 43 automobile dealers in Pittsburg; there are 82 automobile manufacturers represented in Pittsburg; there are over 3,000,000 people in the Pittsburg district; Pittsburg has more people within a radius of 75 miles than any other city in the United States, except New York and Chicago; Pittsburg has 1,000 millionaires; there are more high power automobiles used in Greater Pittsburg than in any other section of this country.

The show committee is composed of W. H. LaFontaine, Earl Kiser, Thomas I. Cochran and W. N. Murray. The Pittsburg Automobile Dealers' Association officers for this year are: President, W. N. Murray; secretary, A. L. Banker; treasurer, G. P. Moore; vice-president, W. H. LaFontaine; assistant secretary, A. E. Doherty.

CHICAGO'S NEXT SHOW WILL BE HELD IN FEBRUARY, 1909

IT was confidently expected that last year represented the first and last trials of early show dates, and that in future a return would be made to former practice, action of this nature now having been taken by both the Licensed Association and the National Association of Automobile Manufacturers, the latter at its New York meeting, January 8. Show matters came up for discussion and were referred to the show committee, which decided to recommend at the next meeting of the executive committee that the next show be held two weeks after that at Madison Square Garden, which will bring it during the first week of February, 1909. The report of General Manager S. A. Miles, on the last Chicago show, revealed the fact that, despite the unfavorable conditions, the attendance was greater than ever before.

At the request of the American Automobile Association, S. D. Waldon and W. T. White were appointed to represent the association in an advisory capacity, and Messrs. Waldon, White and H. O. Smith were appointed a committee to attend the meeting of the touring board of the A. A. A.

One of the results of the meeting of the executive com-

mittee was the election of H. E. Coffin, representing the E. R. Thomas Detroit Company, to membership, Mr. Coffin being the first man to have this honor since the initiation fee has been raised to \$500. The association contemplates the establishment of a comprehensive traffic department, the subject being referred to the transportation committee of which Benjamin Briscoe is chairman.

The executive committee voted unanimously in favor of the adoption of the following resolution:

"WHEREAS, This association has been appraised of the sad death of M. L. Goss, a member of its executive committee, and one of the veteran members of the automobile industry; be it

"RESOLVED, That the Executive Committee, on behalf of the members and itself, deeply deplores the loss of an efficient associate, a man of valued counsels, a gentleman of endearing personal qualities and a friend, and that the sincere sympathy of this association, as a body, be extended to his bereaved widow and family.

Those present at the meeting were: Thomas Henderson, L. H. Kittridge, William R. Innis, R. D. Chapin, W. T. White, C. C. Hildebrand, S. T. Davis, Jr., A. L. Pope, William E. Metzger, and Charles Clifton.

SCHEDULE OF ASSETS OF THE E. V. CO.

HARTFORD, CONN., Jan. 13.—John R. Hills and F. C. Billings, of Hartford, appraisers, and Halsey M. Barrett, of Bloomfield, N. J., and Henry W. Nuckols, of Hartford, receivers of the Electric Vehicle Company, have just filed in the Superior Court, through their attorneys, Bennett & Goodwin, an inventory of the real estate, plant, merchandise, patents and book accounts of the Electric Vehicle Company in the State of Connecticut, showing a total of \$1,709,603.08.

Under the head of "merchandise account," which includes finished parts, general stores, work in progress, finished vehicles, consigned cars, second-hand cars, stationery and the like, the company's inventory showed a total of \$1,093,565.70, which the appraisers have reduced to \$756,836. In the case of the book accounts the shrinkage has been greater proportionately, the total inventory value being \$143,939.57, and the corrected value being \$86,617.08.

"Schedule K" consists of the entire capital stock of the New Haven Carriage Company, of New Haven. This was acquired in 1899 for \$194,000, and in the interim it has paid more than \$200,000 in dividends, so that it is considered as one of the most valuable assets of the company, being listed as worth \$212,500. The final schedule of the inventory refers to the company's patent holdings and is as follows:

"Selden, Patent, U. S. Patent No. 549,160.

"This patent on a road engine is considered very valuable by the officers of this company, which holds the exclusive license with the right to grant sub-licenses for the use of this patent. We are informed by the receivers that the rights of the Electric Vehicle Company in this patent have been productive of a large net income during the past five years, which income has been in excess of \$500,000. This patent has still five years to run, and if the income from this source during the next five years shall equal or approximate that of the last five years, it is apparent that this patent is a valuable asset of the company." * * *

RUSHMORE DESIGN PATENTS UPHELD.

According to information supplied by the Rushmore Dynamo Works, Plainfield, N. J., their action for unfair competition which has been pending against the Manhattan Lamp Works for more than a year past, has been decided by Judge Ray in the United States Circuit Court, granting a permanent injunction against further manufacture or sale of imitations of the Rushmore lamps or parts, such as shells, rear covers, front doors, ventilators, etc., as well as enjoining the use of the name "flare front" in connection with searchlights by any other concern. The decision refers to a number of others of like nature as precedents, and in view of its sweeping effect, similar actions will be brought against other infringers who have pirated Rushmore designs.

In part, Judge Ray says in his decision:

* * * "It seems to me that when defendant copied 'Rushmore' in every detail except functions and quality of material and weight of material, etc., in short, as to appearance, he had a purpose. This purpose is made evident when we look at what he did in putting the imitation on the market. That he did defraud and injure the complainant, and to some extent the public, cannot be questioned. That his acts led to confusion in the trade and among purchasers and users is self-evident. The result could not be otherwise. A person must be held to intend the known and reasonably to be apprehended consequences or results of his own acts, when such acts are knowingly and intentionally done." * * *

E. V. STRATTON BECOMES A STUDEBAKERIST.

In line with their policy of expansion, the Studebaker Automobile Company's New York branch at Broadway and Forty-eighth street has secured the services of E. V. Stratton, who for the past year has served so well as manager of the New York Automobile Trade Association. Mr. Stratton will be associated with C. F. Redden in the marketing, both wholesale and retail, of Studebaker cars. Mr. Stratton is peculiarly well fitted for his new position owing to his experience in the Trade Association during the past year.

HOW THE TIRESMAKER VIEWS SITUATION.

A busy year for accessory branches of the automobile industry is predicted by W. B. Miller, sales manager and secretary of the Diamond Rubber Company. The basis of this statement is a careful analysis of reports from all sections. These reports indicate that the amount of renewal business to be done will be larger than ever before. The number of automobiles in use the past year will not be reduced. If some owners do not see fit to use their machines, the cars will pass to those who will. The number of new cars to be provided for, while not equal to that of 1907, will still reach, in the aggregate, a very large figure, making in the grand total a great extent of equipment necessary.

It is to be expected that business will be done along more conservative lines in all branches of the trade. The accepted forms of regular merchandising will prevail to a greater extent than formerly, and high quality, particularly in tires, will be demanded because of the true economy of using such products. The far-seeing dealer and consumer are both on the quality platform, and both alike working for the greatest economy in up-keep cost. That they should do so is highly desirable. The 1908 season will undoubtedly see greater discrimination in buying exercised by all automobile owners, and the general effect cannot but be healthful and beneficial to the industry as a whole.

TAXICABS FOR CHICAGO WELL UNDER WAY.

To the Elmore Mfg. Company, of Clyde, O., goes the prestige of having placed in Chicago the first taxicab service installed in the "Windy City." Owen H. Fay, the Chicago agent for the Elmore car, is the man who will introduce and operate the taxicab service. It is expected that the Elmore taxicabs will be in operation sometime within the month. The chassis are practically completed at the Elmore factory, and as soon as the bodies and tops are received, the completed cabs will be rushed on to Chicago, where stands will be established at the Auditorium Annex, the Palmer House, and the Great Northern Hotel.

The Elmore taxicab engine will measure 24-horsepower, and the running speed of the cab, fully equipped, will be 35 miles an hour, carrying five passengers.

POPE-HARTFORD ON A. C. A. DYNAMOMETER.

In giving a description of the first public trials of the recently completed dynamometer equipment of the Automobile Club of America, the fact that the first car to undergo a public test was the club's 30-horsepower Pope-Hartford was inadvertently omitted, which was unfortunate in view of the fact that the car made such an excellent showing on its tests. Though this was its first public appearance in this rôle, the club's Pope-Hartford has probably been on the rollers of the dynamometer more than any other single machine, as Dr. Wheeler employed it in breaking the crew that handles the equipment.

PALMER & SINGER TAKE ON NEW LINES.

Dropping all connection with the Matheson car, the Palmer & Singer Manufacturing Company, of New York, will shortly move into new premises opposite their present quarters, and handle the Simplex car, formerly made by the Smith & Mabley Company. In addition they will market three new P. & S. models, consisting of a four-cylinder 40-horsepower touring car, an elegant town vehicle and a six-cylinder 60-horsepower runabout. The Isotta-Fraschini Import Company, now located at Thirty-third street, will occupy space in the new building of the Palmer & Singer Manufacturing Company, on Broadway.

HOL-TAN MAKES BENZOL TEST UNDER DIFFICULTIES

A NEW YORK-PHILADELPHIA and return trip by a 25-horsepower Hol-Tan runabout, driven by Joseph Tracy, proved conclusively that benzol was practical as a fuel for automobiles, but failed to give all the scientific data that was expected of the experiment. At 9:30 on Friday morning, January 10, Joseph Tracy introduced himself to

TRACY STARTING FOR PHILADELPHIA ON HOL-TAN BENZOL TEST.

a stock of chest protectors, slipped into his furs, and climbed into the speedy-looking runabout provided by the Hol-Tan company for the test. H. J. De Bear, official observer, occupied the adjoining seat, and when Mechanician V. A. Nielson had started up the motor after a little delay, which might have happened to any gasoline-fed unit on such a cold morning, a start was made for Quaker City.

The object of the test was to ascertain the value of ben-

zol as a substitute for gasoline without any structural changes in the equipment of the car. Benzol, a water-white liquid produced as a bi-product in the manufacture of coal gas, consists of a mixture of benzine, toluene and xylene. It commences to distil at about 176 degrees F. and does not completely distil until nearly 248 degrees F. is reached. Its calorific value is about 20,000 B. T. U. Its specific gravity is about .885 and it contains about 92 per cent. carbon and 8 per cent. hydrogen. As benzol has a higher specific gravity than gasoline and develops more power than the commonly used fuel, it was necessary to have a smaller nozzle and readjust the float. The construction of the Hol-Tan carbureter allowed this to be done merely by adjustment, the car which started out for Philadelphia being thus in all features a standard model.

Seen on his return to New York, Mr. Tracy said:

"We reached Philadelphia with no other trouble than one or two stoppages caused by impurities in our fuel. For some reason or other sand and straw had been allowed to get into the benzol and we had to stop to clean out the obstructions caused by its presence. Otherwise the car ran in a thoroughly satisfactory manner, developing more power than we could have obtained from gasoline. On Saturday morning, when ready to return to New York, we had some difficulty in replenishing our supply of fuel."

An official of the Hol-Tan Company declared that the test had been practically abandoned owing to defective ignition. "For a large portion of the run," he said, "only two cylinders were working, the trouble being with the magneto. On this account we have not been able to get all the data we hoped for, nor to prove anything very conclusive. One thing, however, is certain, the Hol-Tan car is thoroughly capable of running economically on benzol. In order to get more detailed information of a scientific nature, we shall repeat the experiment in the near future."

ONE MAKER'S PRACTICAL ROAD TEST OF THE "SIX VS. FOUR"

BY GEORGE H. STROUT, SALES MANAGER OF APPERSON BROS. AUTOMOBILE COMPANY.

AS far as my observation goes, it looks as though most makers of six-cylinder cars have produced their new type of engine by adding two more cylinders of the same size as they formerly used in their four-cylinder motors, and, of course, making the necessary mechanical changes to conform to six-cylinder construction and to properly care for the increase in power. Or that they have designed an entirely new six-cylinder motor, without regard to the piston displacement of the four-cylinder motor they had formerly been building. Then, by theoretical, technical and practical tests and deductions they have tried, seriously and honestly, to determine which is the better, the "six" or the "four."

The Apperson method of trying to arrive at the exact facts in the case has varied from the method adopted by other makers. We believe that "the proof of the pudding is in the eating." We believe that both the "six" and the "four" each have advantages not possessed by the other, and it is our purpose and intent to find out, if possible, which of the two possesses the greater advantages, including power, speed, life of motor, cost of maintenance, and repairs. Some factories have turned out four-cylinder motors that have not been practically successful, and it might be "good business" for them to jump into the six-cylinder field.

For some years we have been building a four-cylinder automobile motor, with cylinders of 5 1-2-inch bore and 5-inch

stroke that has been entirely successful and satisfactory to all concerned. I believe that our friends and our competitors will concede that to be a fact. The total piston area of this four-cylinder motor is 95.0334 cubic inches. Many months since we designed and built a six-cylinder motor with 4 1-2-inch bore and 5-inch stroke, total piston area, 95.4261 cubic inches. It will be noted that the total piston area of this six-cylinder motor is only .3927 of a cubic inch greater than the total piston area of our four-cylinder motor. The six-cylinder engine weighs approximately 75 pounds more than the four-cylinder engine, and occupies only 2 1-2 inches more space under the hood. Both engines go into the identically same chassis, and, barring the small additional weight of the "six" engine itself, they must propel the same number of pounds of chassis and body. We have been driving our "six" in competition with the "four" only four or five months, and so we cannot yet arrive at accurate conclusions. We believe each type has its advantages, but right now, although we are building both, we are under the impression that the disadvantages of the "six" outweigh its advantages.

As regards the relative speed that can be made by the "six" and the "four" of equal piston area, we hope to satisfy ourselves on that point at Savannah. While Edgar Apperson will race the four-cylinder "Jackrabbit" at Savannah in March, he will also have, for speed tests, a "six" of the same piston area,

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

E. P. Blake, agent for the Jackson and Logan cars in Boston, has leased Horticultural Hall for the purpose of holding his own show during the week of the Boston automobile show, March 7. No admission will be charged.

I. P. Ryland, of the law firm of Ball & Ryland, has been chosen trustee in bankruptcy for the Kansas City Motor Car Company, Kansas City, Mo. Mr. Ryland was the choice of the creditors and will take charge of the plant within a few days.

Extensive alterations and improvements are being made to the factory of the Holsman Automobile Company in Chicago. Additional store space has been obtained and new tools and tool vaults installed with a view to a substantial increase in the output during the coming season.

Comet spark plugs, made by the Oakes & Dow Company, Boston, were used in the Haynes which made a clean score in the Chicago Motor Club endurance run. The makers received a strong testimonial letter from the Haynes factory last week speaking in the highest terms of the Comet plug reliability.

So many offers were received for the "Old English Coach," a 1908 Pope-Toledo creation, that the makers were in a quandary as to who should have it, this being finally settled by its sale to August Busch, vice-president of the Anheuser-Busch Brewing Association, St. Louis. Mr. Busch intends to tour Europe in his new car, which was one of the chief reasons for its purchase.

The Chicago offices of the Indestructible Wheel Company have just been removed to the Auto and Parts Building, 1221 Michigan avenue, where a full line of the steel stampings made by this firm will be kept on display in charge of a competent man. The sales of Indestructible steel wheels since the last Chicago show has been very large and have necessitated improvements at the factory at Lebanon, Ind.

According to E. C. Morse, the new commercial manager of the E. R. Thomas Motor Company, Buffalo, the demand for excess power in a car is greater than ever before, as witness the call of the Thomas 6-70 Special. It was originally the intention of the Thomas company to build but a small number of these cars for special customers, but the demand has increased to such an extent that this plan must necessarily be abandoned, and it is now quite likely that the original estimates for these six-cylinder cars will have to be quadrupled.

DEATH OF M. L. GOSS.

As the result of what appeared to be a trivial accident at the time, M. L. Goss, secretary of the Baker Motor Vehicle Company, died at his home in Cleveland on Friday night, January 3. On the Monday previous his hat blew off while driving home in the evening and in recovering it he was thrown down by an automobile which collided with him. He was apparently not injured and walked back to his car and drove home. Alarming complications did not set in until the following Thursday, to which Mr.

Goss succumbed the following day. Like so many men who have become prominent in the automobile industry, Mr. Goss was a graduate of both the bicycle and sewing machine lines. He was born in Boston in 1849 and had made his residence in Cleveland ever since 1871, when he entered the employ of the Howe Sewing Machine Company. In 1879 he went with the White Sewing Machine Company, later becoming its secretary, which post he held until 1893. Shortly afterward he became sales manager for H. A. Lozier & Company, and was interested in the wholesaling of bicycles in Cleveland, while later he was associated with the Keating Bicycle Company, at Middletown, Conn. As soon as the electric vehicle became a factor in the automom-

M. L. GOSS.

bile industry, Mr. Goss took it up and has done considerable toward its development since then. In addition to being the secretary of the Baker company, at the time of his death, he was an executive officer of the National Association of Automobile Manufacturers and treasurer of the Association of Electric Vehicle Manufacturers. He leaves a widow and a daughter and son, Ralph H. Goss. The funeral was held at the Wade Memorial Chapel on Monday last, the interment being at Lakeview Cemetery.

NEW AGENCIES ESTABLISHED.

The Hartford Rubber Works Company has opened a branch at 1817 Boylston street, Boston, Mass.

The South Broad Auto Company, Philadelphia, Pa., has taken the agency for the Kisselkar, made by the Kissell Motor Car Co., Hartford, Wis.

John Van Benschoten, of Poughkeepsie, N. Y., and John H. Bulkley, of Southport, Conn., will represent the Lozier line of cars in their respective districts during the coming year.

Joseph B. McKague Company, 324 Dearborn street, Chicago, Ill., have taken the western agency for the "Englebert" tires and will locate in Michigan as soon as a suitable place can be found.

Stearns cars will be handled in Boston and vicinity by Morgan A. Kent, and new salesrooms will be opened on the corner of Boylston and Gloucester

streets, in the heart of the new automobile row.

The Gordon Auto Supply Company, maker of the well-known Eisner spark coils and Gordon spark plugs, has opened their new store at 1024 Boylston street, Boston, with a full line of sundries. H. Eisner is manager.

G & J tires will be represented in Boston hereafter by the Enterprise Rubber Company, 110 Federal street, Boston. D. B. Price and R. J. Baker, who were formerly with the G & J branch store, will join the selling forces of the new representatives.

Studebaker Bros. Company, of New York, has opened a new branch at 1020 Boylston street, Boston. In connection with the salesrooms, a well-equipped garage and electric charging plant will be maintained. R. W. Daniels is the Boston branch manager.

Among the new agencies recently established by the Forest City Motor Car Company, Massillon, O., for the sale of the Jewel cars, are the following: F. A. Faller, Wilmerding, Pa.; Broad Street Garage Company, Bethlehem, Pa.; Brodess & Company, Decatur, Ill.; C. N. Albright, Akron, O.; D. W. Goble, Monon, Ind.; Ray Wortham Company, Ft. Worth, Tex.

PERSONAL TRADE MENTION.

Percy Megargel, who has made three trips across the continent in an automobile, is now writing an automobile novel in collaboration with Grace Sartwell Mason, the well-known writer of short stories, and it is said the result of their labors will be the first purely American automobile romance.

Charles S. Henshaw, of Boston, who has handled the Haynes and Thomas product in New England for several years, has disposed of his interest in his Boston retail store, and signed with the Haynes factory to look after the trade exclusively appointing agencies. Boston will be Mr. Henshaw's headquarters, covering New England particularly.

The E. R. Thomas Motor Company, of Buffalo, N. Y., announces the appointment of Fay L. Faurote as advertising manager. Mr. Faurote comes to the Thomas company with five years' experience in the automobile field and will immediately inaugurate an extensive campaign of Thomas advertising, as it is Mr. Faurote's opinion that the automobile industry is on the eve of one of its most prosperous years.

Arthur N. Jervis, of New York City, the well-known and popular writer, publicity and advertising expert who has been associated with the automobile publicity end for several years past, has found the strain too much for him during the past few months and will consequently go South for a few weeks to take a much-needed rest. Mr. Jervis did much of the active work in connection with the Licensed Show in the Garden last November in addition to his numerous other duties, which are usually more than sufficient to occupy all his time. During his absence, John C. Wetmore and Mr. Jervis' secretary, E. F. Korbel, will look after his interests.

THE AUTOMOBILE

WINTER TOURING OVER THE NATIONAL HIGHWAY

By PATHFINDER.

AN historian writing in 1901 of the National Highway, remarks: "The era of the National road was succeeded in half a century by that of the railway, and a great thoroughfare, which was the pride and mainstay of a civilization, has almost passed from human recollection." It is a particularly striking example of the impetus given to the good roads movement by the autoing fraternity that to-day, scarcely seven years from the time the above comment was made, the National Highway, far from having "passed from human recollection," has been restored in many places to perfect condition, and in the six States through which the Highway passes its care and improvement are a matter of especial concern to State and county highway commissions. Within the last few years, thanks to the agitation of the automobilists, large sums of money have been expended on the highway, and, although the work of

rehabilitation is far from complete, it now deserves the favorable attention of the tourist who is planning his trips for the coming season. Certain details relating to the Highway, from the automobilist's point of view, as observed by me on a recent trip from New York to Columbus in my White steamer, may therefore prove of interest.

As the National Highway proper commences at Cumberland, Md., the first question presented is: "How does one get to Cumberland?" The tourist should first make his way to Gettysburg, Pa., following one of the routes which I described in an article in *THE AUTOMOBILE* of November 22, 1906. From Gettysburg, the route lies by way of Waynesboro to Hagerstown, this portion of the journey being well described in the April 18 issue of *THE AUTOMOBILE*, in my article relating to return routes from the Jamestown Exposition. Hagerstown, in other ways of com-

TYPICAL STRETCH OF ROAD THAT CONTINUED MILE AFTER MILE ALONG THE FAMOUS OLD NATIONAL HIGHWAY.

EXAMPLE OF INEFFICIENT LABOR IN ROADS REPAIRING.

paratively little importance, should have a prominent place in every autoist's map. It is the radiating point for routes of the greatest importance—northward to Chambersburg and Gettysburg, eastward to Baltimore and Washington, southward to the Shenandoah Valley, and, finally, westward to Cumberland. Of these several routes, all of them were familiar to me except the last, and it was with no small degree of curiosity that I last week started westward from the square in Hagerstown, having only the faintest idea of what lay before me.

Hardly had we left Hagerstown than we encountered that familiar institution, the toll-gate, which, annoying though it be, is generally an indication of good roads beyond. We found that the toll road extends about thirteen miles, and then enters the mountains. I noted by my speedometer that it was a mile and a half climb to the summit of the first ridge, from which was presented a view of the greatest magnificence, typical of what we were to encounter throughout the rest of our journey. Then came a coast down the mountain of another mile and a half. Thereafter, throughout our journey in Maryland and Pennsylvania, we crossed so many ridges that I lost count of the number of climbs of one, two and three miles and of coasts of equal length. The grades, however, were nowhere excessive—at least, they did not seem so to me, equipped as I was with a power plant of exceptional hill-climbing capabilities.

Twenty miles from Hagerstown we reached the valley of the Potomac River and had a few miles of comparatively level going, passing meanwhile through the town of Han-

LUMBERMAN APPROPRIATED ROAD AS THOUGH HE OWNED IT.

cock, at which point a bridge spans the river and leads to the West Virginia shore. Our road, however, lay straight ahead, and soon we were once more in the mountains and, from that point on to Cumberland (67 miles from Hagerstown), we did not have a hundred feet of level country. It was a case of uphill, then downhill, up and down, up and down. In the section between Hancock and Flintstown (13 miles east of Cumberland) we traversed the poorest section of road on our entire journey. There are no culverts, and in the little valleys the drainage has washed deep channels across the road. The surface is composed entirely of loose stone, and is very hard on tires. Yet it is little wonder that this section of the road has been neglected, since the country is practically uninhabited, and, from the base of one mountain to the base of the next, we would not see a human habitation. At Flintstown commences a fine stretch of road over which, despite the grades, quick time can be made to Cumberland. At this point in the narrative we might pause to inquire briefly into the history of the National Highway.

A Bit of National Highway History.

In the first years of the eighteenth century the question of better means of communication between the seaboard States and the growing settlements on and beyond the Ohio

WHITE STEAMER PATHFINDER: "WHERE ARE WE AT?"

River was an important topic of debate in Congress. That body, in 1806, passed a law authorizing the president to appoint "three discreet and disinterested citizens—to lay out a road from Cumberland, on the north banks of the Potomac to the Ohio River." In 1808 the work of construction commenced, and in 1818 the road through to Wheeling was open for traffic. It is interesting to note that there was considerable rivalry between Wheeling and Steubenville to secure the western terminus of the highway. Wheeling won out through the influence of Henry Clay, and the successful town later acknowledged their obligation by erecting a statue to that statesman.

Progress of the Road Westward 80 Years Ago.

In the period between 1820 and 1833 the road was extended westward by degrees to Zanesville and then to Columbus. About this time, however, the question of further National road improvement became mixed up with the "States' Rights" controversy. Moreover, many members of Congress believed that money would be expended to better advantage in the construction of the new style of highway, the railroad and national aid to good roads came practically to an end. In 1835 Congress ceded those portions of the National Highway which had already been constructed to the

several States. In Indiana the "National Highway" was completed under State supervision, although following the survey previously made by the Federal government. In Illinois the plans of the Federal engineers of a century ago have not yet been entirely consummated. From Cumberland to Wheeling, therefore, is the original National Highway, and, in its early history, it was of much more importance than those portions west of the Ohio river, which were developed at a later date.

Highway Has an Individuality.

With this data in mind, we started out on the National Highway and were at once impressed with the fact that it possesses a distinct individuality. From 60 to 80 feet wide, with two and sometimes three lines of telegraph and telephone poles, there is not the slightest chance that the tourist will lose his way between Cumberland and Wheeling. Road directions dealing with forks and turns are superfluous, as the highway at all times completely overshadows the puny little crossroads and forks which at intervals join with it. Then there are the old mile posts of distinctive type, made in pyramidal form and built of heavy iron plates, which, although thick with rust, have nevertheless survived a century of exposure. Then, what local road builders ever laid a road so straight as did the "discreet and disinterested" National Highway Commission! Where the contour of the country permits, the highway is perfectly straight for mile after mile.

In the 30 miles west of Cumberland there is much climbing to be done, until at Keyser's Ridge an elevation of 2,300 and 2,328 feet is obtained, the highest point of the highway. Three miles further the road crosses the State line from Maryland into Pennsylvania. At Petersburg we found a delightful old-fashioned hotel, where we spent the night. And glad we were to seek shelter indoors, for we had encountered conditions which will not be met by those who make the trip in the touring season. The mountains were covered with snow, and in some places were great drifts through which we made our way only by "bucking" and by occasional use of a shovel—a handy part of a tourist's equipment in any season of the year. But even in the sections where the snow had accumulated the deepest, there were occasional spots where the ground was bare, and we had the opportunity to observe that the surface of the road is uniformly excellent for automobiling.

Coast Down Mountainside.

The approach to Uniontown is signaled by a coast down the mountainside of more than three miles. At this place the Hotel Titlow well deserves the patronage of tourists. "Allow four and a half hours for the 70 miles to Wheeling," said Mine Host Titlow, an enthusiastic autoist, and

EVEN OHIO HAS SOME TOLL GATES—THIS ONE CHARGED 2 1-2 CENTS PER MILE.

his estimate of the normal touring schedule proved correct. Beyond Uniontown the country flattens out, comparatively speaking; that is, the grades are seldom more than a half mile long, and the hills are sufficiently gentle to permit of the road being laid out perfectly straight for miles.

At Brownsville, 78 miles from Cumberland, the highway takes the shape of a horseshoe, composing the main street of the town. One end of the horseshoe is at the summit of a hill, while the other end is far below, at the old, ramshackle, wooden covered bridge across the Monongahela river. The next town of any size is Washington, Pa., where is located the Washington and Jefferson College. In this town it was necessary for us to note two right-angled turns, but I am inclined to believe that originally the highway passed straight through the town and that local changes in laying out the streets account for these turns. Washington, it may be said in passing, lies almost due south of Pittsburgh, the distance between the two places being only 32 miles.

From Washington it is a ride of but 18 miles to the State line of West Virginia, from which point it is another 16

OLD-TIME TAVERN ON SAVAGE MOUNTAIN, ONCE THE SCENE OF COLONIAL HOSPITALITY.

BRIDGES ARE OF EXCEPTIONAL SOLIDITY, WELL CONSTRUCTED.

miles to the Hotel McLure in the center of Wheeling (136 miles from Cumberland). Although the hills rise up on every side, that portion of the highway which lies in West Virginia is practically level, and, for the most part, is absolutely perfect with no ruts, no holes and no "Thank-yema'ams." Honor to West Virginia! May her sister States emulate her example.

I have reserved for treatment in a special paragraph of condemnation the awful water breaks which we encountered all along our route from Hagerstown to Columbus, except in certain isolated sections. West Virginia is the only State which does not need reproof. It is true that the State Highway Commissioner of Pennsylvania is making efforts, within the limits of his appropriation, to obliterate these relics of a barbaric age, yet much remains to be done within his domain. "Maryland, My Maryland," if there is a tourist who can travel within your fair borders without constant blasphemy, he must be made of different stuff than is the average mortal. Ohio, as regards its eastern counties, is the worst offender, for heavy toll is charged, and the roads should be above reproach. Also, as the country there is more level, there is less excuse for the existence of these water breaks than there is in the mountains. Thirdly, the Ohio water break is a mean, narrow, square-sided affair, much more severe on springs and nerves than the more amply proportioned breaks of Pennsylvania and Maryland.

ONLY FORK ON HIGHWAY WHERE ONE CAN GO ASTRAY.

Resuming the narrative—the next stage of our journey carried us from Wheeling to Columbus. There is an island of considerable size in the Ohio river opposite Wheeling, so that two bridges must be crossed before the tourist finds himself in the State of Ohio. In Ohio the iniquitous system of county supervision of highways prevails, with the result that conditions vary from county to county as one crosses the State. In Belmont and Guernsey counties, we paid \$1.48, or at the rate of 2 1-2 cents per mile, for the privilege of passing over roads which, although otherwise excellent, were marred by frequent water breaks. In the next county, Muskingum, no toll is charged, and the roads are of about the same general character. The country here flattens out completely and, in the next county, Licking, commences that remarkable stretch of some 30 miles which leads into Columbus absolutely without a turn. This portion of the road is almost flawless, unless we object to the fact that an interurban trolley road has encroached on about half the original width of the highway. At Columbus, 130 miles from Wheeling, this stage of our journey terminates.

How remarkable has been our 270-mile, one-road tour. Commencing at Cumberland, we have crossed the Alleghenies, have traveled in Maryland, in Pennsylvania, in West Virginia, and in Ohio, and yet we have been but three days on the road since we last saw the Potomac, and we are within five days of "Dear Old Broadway."

FOUR NATIONS, TEN CARS, TO ATTEMPT NEW YORK PARIS RUN

TEN automobiles, representing four countries, are declared to be ready or in active preparation for the dash from New York to Paris via the Behring Straits. The New York *Times*, which is organizing the contest in connection with the Paris *Matin*, gives the list as follows:

France—De Dion, Motobloc and Sizaire-Naudin.

Italy—Itala and Brixia-Zust.

Germany—Portos.

America—Thomas, Maxwell, Hol-Tan and White.

The German entrant, which is being backed by a Berlin newspaper, will sail direct from Hamburg, instead of Havre, and is due to arrive in New York February 7. The three French cars will leave Paris January 28, traveling under their own power to Rouen and Havre, at which port they will be shipped for New York, arriving here February 8 or 9. Nothing is announced regarding the arrival of the two Italian competitors, the Brixia-Zust and the Itala. The former, a four-cylinder, 40-horsepower car, will be handled by Marquis Boschi, a young Italian nobleman.

Sizaire-Naudin, the makers of a French voiturette which

has had extraordinary success in racing during the past year, will put in the smallest powered car, a little four-cylinder machine rated at 12-horsepower. They have secured as their driver Paul Pons, who mounted a Contal tricar out of Pekin and left it to rot and rust on the Gobi desert. De Dion appears to have made very careful preparation and studied the problem of crossing the Arctic regions in a thorough manner. They have the advantage of experience gained by the two machines which successfully covered the entire distance from Pekin to Paris.

Not much is heard about the preparation of the four American cars for the round-the-world trip, though if the contest is to be entered into seriously they should certainly be out of the factory three weeks before the start, which is announced for February 15. The Maxwell-Briscoe firm states briefly that its entry will be a stock four-cylinder car with such modifications as are necessary for the trip. It will be handled by W. J. Hanley, the explorer. The Hol-Tan car is declared to be under preparation at St. Louis. Montagu Roberts is spoken of as the driver of the Thomas.

SAVANNAH'S BIG STOCK CAR ROAD RACES MEET, MARCH 18-19

MARCH 18 and 19 are the dates selected for the big stock car chassis road races of the Savannah Automobile Club, which will be assisted by the special committee from the Racing and Technical boards of the American Automobile Association. The events will be three in number, the principal one being a 360-mile contest over an 18-mile course for the Savannah Challenge trophy. A 150-mile event over a 10-mile course for six-cylinder cars and a similar event for runabouts will be the card for the opening day, the star event being scheduled for Thursday. The course will be one of the fastest in the country, and between 1,200 and 1,500 soldiers will be utilized in its guarding.

The City of Savannah has appointed a special committee to work in conjunction with the Automobile Club, its make-up being very influential in character, and including the following: Mayor George W. Tiedeman, William B. Stillwell, president of the Board of Trade; Wright Hunter, president of the Cotton Exchange; Major W. W. Williamson, president of the Chamber of Commerce; Capt. R. J. Davant, chairman of the City Council and commanding the Chatham Artillery; Frank E. Battey, president of the Savannah Automobile Club and member of the City Council; Arthur W. Solomon, secretary of the Savannah Automobile Club; A. B. Moore, vice-chairman of the County Commissioners; Albert Wyly, chairman of the Chatham County Road Commissioners; Harvey Granger, a prominent member of the Board of Trade, and Jack Rauers, member of the Cotton Exchange and proprietor of the De Soto Hotel.

Two entries have already been made and the fees paid even before the issuing of the entry blanks: Edgar Apperson entering an Apperson, and H. O. Smith coming forward with a Premier.

The rules governing, as promulgated by the special committee, are as follows:

RULES GOVERNING.

These events are known as Stock Chassis Speed Endurance Contests, open to standard stock car chassis equipped with racing bodies. Conditions governing are as follows:

1.—**Stock Chassis:** To permit of entry under these rules the chassis shall be a standard chassis for the car in the class in which it is entered. Chassis to be eligible shall be so constructed and complete that, without any changes whatsoever, it can, by adding the necessary parts, be assembled into a complete car of its kind. Said car shall be subject to sale at the list price, and orders for any number of exact duplicates shall be accepted at its list price.

2.—**Eligibility:** Cars eligible for entry must be the product of a recognized motor car manufacturer, who, during the period of one year prior to February 1, 1908, shall have built not less than fifty cars of all models, of which not less than 10 per cent. shall have been manufactured of any model entered, and details of construction must conform to those of the regular stock chassis of the same model or models.

3.—**Stripping:** The chassis may be stripped of lamps, lamp brackets, mud guards, guard irons, running board, irons and steps, but must carry the regular stock hood. The loss of the hood during the race shall have the effect of disqualifying the car.

4.—**Examination:** Every car entered in these contests shall be subject to a detailed examination by a committee of three members of the Technical Board of the American Automobile Association,

for the purpose of seeing that no evasions of these rules have been attempted. This examination shall be at headquarters on the course not later than three days prior to starting in a contest, and if it is found that evasions have been made or attempted, the car shall be disqualified and shall not be allowed to start. There shall be no appeal from the decision of the committee, and entry fee shall be forfeited, and manufacturer and driver shall be barred from future events for such period as the Racing Board may decide.

5.—**Regular Equipment:** Location of engine, transmission, and dash, and location and capacity of gasoline tank and oiler shall be as per regular equipment.

6.—**Steering Column:** Location and angle of steering wheel shall be standard, using standard steering column, gear wheel, and all steering connections.

7.—**Tires:** Kind of tires to be used are optional with the entrant, except diameter of wheels, which shall be standard.

8.—**Speed Qualifications:** Any car to qualify for entry under these rules must show that it is able to make one mile over a substantially straight measured course, under official observation, at the rate of 45 miles per hour. A car may run in either direction on this measured mile. Each entrant is to be given ample opportunity to qualify, but must do so in not to exceed four trials. The officials mentioned in Article 4 are to decide whether the car is eligible for entry or not. Entry fee is to be forfeited in case the car fails to qualify in this trial.

9.—**Tread:** The tread of cars in any contest held under these rules will be that regularly employed as standard by the manufacturer entering the car.

10.—**Exhaust:** Cars shall have a horizontal exhaust pointing backwards and having its rear end sufficiently high to prevent throwing up dust. Should the entrant elect to direct the exhaust through the side of the hood, he is to be given this option.

11.—**Weight:** No limit.

12.—**Shock Absorbers:** The entrant has privilege of using same.

13.—**Ratio of Gear:** No restriction.

14.—**Change of Driver:** The driver or mechanic (or both) of a car may be changed, if necessary, during the contest.

15.—**Repairs and Adjustments:** All repairs and adjustments, including tire replacements, are to be made on running time, and by the occupants of the car.

16.—**Extra Parts:** No extra parts are to be carried on cars, except tires.

17.—**Supplies:** Gasoline, oil, and water are to be provided by each contestant, the location of whose replenishing station or stations will be designated by the Race Committee, or subject to its approval. Filling of gasoline and oil tanks by outside help will be permissible.

19.—**Event No. 1.**—No car shall be entered which has a greater maximum piston displacement than 575 cubic inches. Distance of this race shall be 20 laps of the 18-mile course, or approximately 360 miles. The entry fee shall be \$500 for one car and \$250 for an additional car nominated by the same entrant. Any manufacturer may enter two cars.

20.—**Event No. 2.**—No car shall be entered which has a greater maximum piston displacement than 375 cubic inches. Distance of this race shall be 15 circuits of the 10-mile course. The entry fee shall be \$100, and each manufacturer may enter two cars.

21.—**Event No. 3.**—Open to cars with a greater maximum piston displacement than 575 cubic inches. Distance of this race shall be 15 circuits of the 10-mile course. The entry fee shall be \$100, and each manufacturer may enter two cars.

22.—**Date for Closing of Entries:** March 1, 1908.

23.—**Right to Reject:** The committee reserves the right to reject without assigning a reason.

24.—**Protests:** Any protest must be made in writing to the referee and accompanied by a fee of \$50, which will be returned if the protest is sustained. Such protest, if for violation of rules during the race, must be made within 12 hours of the alleged violation. Protest regarding an entry must be made not later than 24 hours before the start of the race.

25.—**Manufacturer's Sanction:** No entry shall be accepted in the name of any other than the bonafide manufacturer of the car without the written sanction of the manufacturer thereof, and his statement acknowledging familiarity with the conditions governing the contest and his assumption of all responsibility for failure on the part of the entrant or his representative to fully comply with the said rules.

26.—**A. A. A. Racing Rules:** Except as hereinbefore specified, the races will be governed by the regular rules of the Racing Board of the American Automobile Association.

RUNABOUT CONTEST TO PRECEDE FRENCH GRAND PRIX

PARIS, Jan. 13.—There will be two days' racing in connection with the French Grand Prix held the first fortnight in July. The day preceding the appearance of the powerful racers a voiturette or small runabout race will be held over the same course under a limited bore rule which will probably be 100 millimeters for single-cylinder engine and 80 millimeters for two-cylinder motors. Entry fee will be fixed at \$200 for one car, \$350 for two cars and \$400 for a complete team of three. Complete regulations have not yet been compiled, but will probably be those of the very successful voiturette contest of last October.

No changes have been made in the Grand Prix regulations adopted by the Racing Board and now approved by the full club committee. Maximum bore is 155 millimeters for four-cylinder engines, distance will be 430 to 500 miles, three cars per firm, and all work to be done by the driver and his mechanic. If the number of engagements makes it necessary, an elimination race will be held over the same circuit, but for only half the distance covered in the final. Engagements at ordinary fees will close on February 15; at double fees on June 1. Tire or gasoline firms desiring stations on the course must put in their applications by the same dates.

and pay a fee of \$200. All stations must be grouped at two points on the course, one of which will be opposite the grandstand. Though dismountable rims can be used, it is forbidden to change a wheel, and the use of oxygen or any addition to the gasoline is contrary to rules. The racing colors for cars of each nation are as last year.

No choice of a circuit has yet been made, the Racing Board refusing to give any information on this matter. Dieppe offers a subvention of \$10,000 if two-days races are held and one other town guarantees to raise \$20,000 to have the contest in its district. It is necessary to maintain secrecy on the courses which are under consideration, the exactions of the natives being such that immediately there is a possibility of their district being selected for the race land along the course increases in hiring value far above what it would cost to buy it outright under ordinary conditions.

Two-cycle Engines Favored in Grand Prix.

PARIS, Jan. 14.—There is a unique opportunity for builders of two-cycle motors in the French Grand Prix, but whether any makers of this type of engine will rise to the occasion is doubtful. The Ostend conference, which drew up the international rules, fixed a maximum bore of 155 millimeters for four-cylinder engines, leaving conditions for all other types to be worked out later. After the matter had been thoroughly discussed by the Racing Board of the French club, it was decided to allow two-cycle engines to have the same bore as those of the standard type, although this would obviously give them an advantage.

René de Knyff, chairman of the board, in discussing the rules, said: "We have certainly favored the two-cycle engine by allowing it to have the same bore as the four-cycle type, but we want to help the two-cycle to prove what it is capable of doing. It is not yet commonly employed and we did not wish, by severe regulations, to make its struggle for favor too difficult. If it is capable of doing anything, there is a chance now for it to prove its power. We shall then have some practical experience, together with laboratory tests, to enable us to fix a more equitable racing rule."

Though a good deal of attention has been paid in France during the past two years to motors of the two-cycle type, few of the firms building this class of engine are in a financial position which would justify them in expending the money necessary to compete in the Grand Prix race. Peugeot is the only powerful concern having produced a satisfactory two-cycle engine, and it has been suggested that they build an eight-cylinder two-cycle racer. For an eight-cylinder engine they are allowed a bore of 110 millimeters, this alone being more advantageous than 155 millimeters for a four-cylinder engine; combining the two would enable a very much more powerful motor to be built, providing the two-cycle type is all that its supporters claim, and would bring it before the public as no amount of private demonstration could.

RULES FOR O'GORMAN NON-RESTRICTION RACE.

LONDON, Jan. 13.—Mervyn O'Gorman was of opinion when international racing rules were adopted that much might be learned from races between cars absolutely unfettered by any bore, stroke, and weight restrictions, and offered a trophy to be competed for on that basis. Rules of the race, just published, provide for the competition to be held between cars of any nation, any power or any type, providing they are wholly mechanical, between May 1 and July 31. Brooklands track will be the place of contest, and distance must be not less than 100 miles. All arrangements for the holding of the race are to be in the hands of the Brooklands authorities, who shall have the power to charge an entrance fee, but must allow the winner to compete free in the next annual contest.

MUST POLICE WESTCHESTER COURSE WELL.

"The Westchester course, selected for the stock chassis race on April 24, is far more sporty than the Vanderbilt circuit of 1905 and 1906, and is a route well calculated to test the skill of the drivers no less than the running qualities and speed of the cars," declares C. V. Redden, manager of the automobile department of the Studebaker Company, of New York.

Mr. Redden, who went over the entire course on a Studebaker roadster, declares: "To make this event an absolute success, it is essential that the course be properly policed. There are a number of cross and intersecting roads which, without an efficient policing system, would make fast driving almost impossible. In fact, upon the proper policing of the course depends to a great extent the success of the race. All who attended the last cup race held on Long Island saw how utterly impossible it was to control the

crowds. It should be remembered, too, that this course is not isolated, but can be easily reached by three different railroads as well as by trolley. The road is generally wide enough for two cars to pass, but I believe that absolute reliability rather than excessive speed will win the race. The ability to get under way after rounding a corner will be an important factor, and the long wheelbase car will be at a disadvantage. From Pine Bridge to Mount Kisco the roads are poor, and from Valhalla back to East View the course leads over a road which is really hilly and will test drivers and machines."

ICEBOAT AND AUTO MAY TEST SPEED.

MONROE, MICH., Jan. 13.—Commodore W. C. Sterling, of the Monroe Yacht Club, and an enthusiastic motorist, holds to the belief that the auto is able to lay it over an iceboat when it comes to speed, and has issued a challenge that promises an innovation in sports. Commodore Sterling wants to race any or all Detroit and Toledo ice yachtsmen, and is willing to wager that he can beat them with his auto on a straightaway three-mile course before the wind. Several yachtsmen have expressed a determination to take the Commodore up, and the outcome will be interesting.

STEEL-RIBBED AEROPLANE, THE LATEST ASPIRANT FOR FLYING HONORS, ON THE TRAINING GROUND NEAR PARIS.

ANOTHER ASPIRANT FOR AEROPLANE HONORS.

Still another aeroplane has been added to the aerial fleet around Paris. The newcomer, built for M. Gastambide and Mengin, is a business-like looking apparatus, in strong contrast to some of the crude and poorly constructed machines to be seen on the testing ground. It is of the monoplane type, with engine mounted in the center, and a three-wheel chassis underneath built up with a certain amount of play to allow for shocks when alighting on the ground. An example of the strength of the wings, 32 feet from tip to tip, was shown on the first day out, when a man stood on the middle of each without any damage being done. The system employed in building up the wings is by means of a framework of thin steel ribs, covered with canvas, each wing fitting into grooves on the chassis of the aeroplane in order to be easily dismantled. The motive power is an eight-cylinder Antoinette motor in V, with a two-bladed aluminum propeller mounted direct on a forward extension of the crankshaft. There is no raising or lowering helm, the constructor believing that the motor is sufficiently supple to give the necessary range of altitude by variation of its speed. Total weight of the machine ready for running is 880 pounds. It is calculated that it will leave the ground when a speed of 34 miles an hour is attained.

TWO THOUSAND DOLLARS FOR 15-MINUTE FLY.

PARIS, Jan. 13.—Two thousand dollars can be earned in fifteen minutes. The only conditions are that an aeronaut mounted on a heavier-than-air machine shall remain in the air for fifteen minutes and be officially controlled by a committee appointed by the Aero Club of France. On his descent he will be handed the cash prize offered by M. Armenguad, president of the French Aerial Navigation Society. The record is now held by Henry Farman, with three minutes aloft on an aeroplane. The new competition will be open until the end of 1908.

PILOTS WILL GO SKYWARD FROM CANTON.

CANTON, O., Jan. 20.—Arrangements have been made by the Aero Club of Ohio for a second balloon ascension here towards the end of this week. It is announced that Lieutenant Lahm will come from Washington to make an ascent if the weather is favorable. President Sherrick, of the Aero Club of Ohio, will probably make an ascension with the balloon Ohio.

FARMAN REMAINS THREE MINUTES IN AIR.

PARIS, Jan. 15.—As if to prove that his winning of the Deutsch-Archdeacon prize for the flight of a kilometer in a closed circle was no mere stroke of good luck, Henry Farman to-day remained three minutes in the air and covered a flight of two kilometers, or 1.2 miles. He began his day's work on the Issy-les-Moulineaux ground with a load of 66 pounds attached to his aeroplane, but found that very slight lifting movement could be obtained. When the load had been reduced to 44 pounds the machine rose into the air and traveled a short distance, but appeared to possess no life.

A 33-pound load was then attached, and the machine driven right across the drill ground to the walls of the fortifications, where a sudden squall struck it and for a moment appeared likely to cause a disaster. Farman was obliged to suddenly turn at right angles, but his machine responded wonderfully, and another run was made on an even keel to the opposite end of the ground, distance from the earth not being more than a yard or a yard and a half.

For the final test all weight was removed, the machine being in exactly the same condition as when it competed for the \$10,000 prize. Starting on the edge of the ground nearest the river, after 50 yards had been covered the aeroplane rose into the air and made for the Porte de Sèvres. Here a turn was made and a vast circular flight begun close to the fortifications. Almost a mile and a quarter was covered before Farman brought his flyer down at the door of the shed, thus accomplishing the longest flight yet recorded for a heavier-than-air machine.

BIG AERO PROGRAM FOR WINDY CITY.

CHICAGO, Jan. 20.—Five handsome trophies and medals and \$10,000 in cash will be offered by the Chicago Aeronautique Club at its national contests to be held here July 2-4. Most important among the seven events on the program is the international race for a \$200 trophy to go to the man who covers the greatest distance; \$200 will go to the aeronaut remaining the greatest length of time in the air. The number of starters is limited to 30. Two prizes are offered for the greatest distance covered in five hours in the single-passenger test, without limitation as to size of balloon. There will be the same number of prizes for the dirigible balloon contest over a course of five miles and return.

Event number four will be a contest between aeroplanes and man lifting kites, the distance to be 1,500 feet.

WHY NOT A GREAT HIGHWAY ALONG THE ERIE CANAL?

FOR a State of its wealth and population, New York is probably more backward where the condition of its highways is concerned than any commonwealth of its size. In view of this fact, the suggestion just put forth to utilize either the tow-path of the old Erie Canal, or the very bed of the canal itself, as the foundation of a great trans-state highway, is particularly appropriate. New York has already appropriated \$50,000,000 to carry on the work of road betterment, but in the interval of a year or so that has elapsed since this has been made no great progress has been accomplished, and it would seem that a substantial part of this appropriation could hardly be used to better purpose than that suggested. In the tow-path there is to be found the basis of a broad highway 325 miles in length, and passing through the majority of the State's centers of population which scarcely needs more than broadening for its realization, while the bed of the canal itself represents a perfectly level stretch of the same length that could be readily converted into a road that would be without an equal anywhere.

When interviewed for the New York *Herald*, State Superintendent of Public Works Frederick C. Stevens was enthusiastic over the project. "I have looked carefully over the proposal to convert the Erie Canal into a great trans-state highway," he said, "and have discussed the plan with legislators, good roads advocates, and engineers. I believe the plan is an excellent one, and believe it should be brought to the attention of our lawmakers, roadmakers, and the public, which is interested in obtaining good and continuous highway facilities."

It would be a comparatively simple matter to either widen the present tow-path, or by filling in the bed of the canal itself create a great highway across the State that would be of vast benefit. In view of the fact that taking advantage of the tremendous amount of work already done would eliminate all preliminary surveys and engineering expense of kindred nature, the cost would be less than half that required to build a new road, and it could doubtless be taken care of under the new plan by which the State pays half and the county through which the road passes pays the remainder. It may be added here that the majority of the counties through which the canal passes are notorious for their poor roads. At present there is a law prohibiting the

use of the tow-path by vehicles other than the time-honored mules which dragged the canal boats across the State from Albany to Buffalo for more than half a century, but that could easily be repealed.

The details of the plan already worked out by Mr. Stevens have reference to the tow-path alone, and in speaking of it he said: "There are many portions of the tow-path that are already wide enough, and all of it could readily be utilized as the foundation of a continuous road. In places the path is more than 30 feet in width, while the narrowest average 15 feet or over. It would be necessary to grade some of the approaches, but nowhere would the engineering problem to be solved be of a serious nature."

As the tow-path has been continuously trodden down by the feet of countless mules for the past seventy years, it will be evident that all this needs to make an excellent road of it as it now stands is a little more width. The total difference in level between Albany and Buffalo is said to be slightly less than 400 feet, there being one stretch of 59 miles just west of Utica, known as "long level," that is without a break of any kind, and is probably unique in such country as upper New York State. In addition to this, the canal is in a great many instances the most direct route between cities that it joins. Between Ilion and Utica, for instance, there is an almost straight and absolutely level stretch of 11 miles, which can be covered in a car in a few minutes, whereas by the road the distance is almost double, and the going is not alone poor, but hilly.

It is, indeed, difficult to conceive of the inestimable benefit that the carrying out of such a project would be to New York State as a whole. The opening of the Erie Canal, the better part of a century since, was described as an epoch-making event in the history of the State, and it is generally conceded that its existence has been one of the greatest single factors in New York's development. In its way, the opening of a road, either paralleling or taking its place, would be an event of no less importance, as apart from the unequalled means of communication it would afford, not alone between the various up-State cities, but clear across the State, it would also furnish an example that could not fail to be taken advantage of by other communities, thus giving a tremendous impetus to the cause of good roads.

LATEST PROPOSITION FOR NATIONAL AID IN ROADS BUILDING

WASHINGTON, D. C., Jan. 21.—That the good roads movement has many friends in Congress is evidenced by the number of bills that have already been introduced looking to the improvement of the national highways. The latest one is fathered by Representative Ferris, and its object is to provide for a permanent, lasting and uniform system of improvement of public highways and post roads by having the State and nation act in conjunction and by mutual contribution bring about the desired end. The further object of the bill is to distribute the surplus in the treasury pro rata each year among the States for that purpose.

The bill provides that it shall be the duty of the Secretary of the Treasury, with the approval of the Secretary of Agriculture, at the close of each fiscal year, to determine the amount of surplus in the United States Treasury, after making all necessary deductions for all expenses and amounts that by law shall remain on deposit in the Treasury, the remainder to be deemed and declared a surplus and available

for distribution among the States and Territories. This surplus is to be distributed at the rate not to exceed one-half million dollars yearly to each State and Territory.

The provision is made that no State or Territory shall receive any of this surplus until it has furnished satisfactory proof that it is willing, ready, and has the ability to pay an equal amount to the aid received under the proposed law. Various other provisions for carrying the law into effect are set forth in the bill, which was referred to the Ways and Means Committee for action and report. Many of the representatives, particularly those from the Western States, are taking more interest in the cause of good roads than has ever been noticed before, and if this interest is properly fostered, in the course of the next year or two, all the legislation that even the most enthusiastic advocate of road improvement could wish for should be forthcoming without great difficulty. But to do this it will be necessary that every autoist interest himself personally in the work.

RIGID CONDITIONS FOR 1908 PRINCE HENRY TOUR

BERLIN, Jan. 15.—The propositions for the Prince Henry Tour, the chief German event in 1908, have now been issued by the Imperial Automobile Club, and in the principal points run as follows:

The Prince Henry Tour is an international reliability trial.

It is open to cars of four and six cylinders, with a total piston surface of 227 to 679 square centimeters, equivalent to a bore of 85 to 146.5 for four and 69.5 to 120 millimeters for six-cylinders.

The cars must be owned by members of recognized clubs and must have been previously driven at least 2,000 kilometers.

The total weight of the car of 227 square centimeters, piston surface, must be at least 860 kilograms, exclusive of spare tires, tubes, and with empty tool box, the fuel excluded in this weight (petrol, water, oil) may not weigh more than 60 kilograms. For every square centimeter more piston surface, the weight is increased by 1.1-4 kilograms.

No alteration in weight may be made during the tour or missing weight be replaced by ballast.

Every car must be provided with a speedometer.

Cars driven by petrol of the specific gravity of 680 and upwards, benzol, and alcohol and their mixtures, are eligible to compete.

The cars must be driven by men who are members of the corporations named above and who receive no equivalent for driving.

Entries must be made by the car owners at the secretarial offices of the Imperial Automobile Club, and must be accompanied by a fee of 400 marks, as well as the certificate of cylinder dimensions.

Entries close on April 1 at 6 P. M.; entries at double fees will be received up to May 1, 1908. Should less than fifty entries be received, the club reserves the right of not promoting the tour; on the other hand, it has the right of limiting the entries.

The tour takes place from June 9 to 17; the weighing-in of the cars takes place on June 7 and 8. The daily stages are:

Tuesday,	June 9,	Berlin to Danzig.
Wednesday,	" 10,	Danzig to Stettin.
Thursday,	" 11,	Stettin to Kiel.
Friday,	" 12,	Rest at Kiel.
Saturday,	" 13,	Kiel to Hamburg.

(Speed trials between Rendsburg and Itzehoe on the flat.)

Sunday,	" 14,	Rest and exhibition of cars at Hamburg.
Monday,	" 15,	Hamburg to Cologne.
Tuesday,	" 16,	Cologne to Trier.
Wednesday,	" 17,	Trier to Frankfurt.

(Hill climb between Trier and Frankfurt. The start takes

places in the consecutive order arranged by the club, once for all, the most consecutive cars, No. 1 leading off first daily.)

Each car must carry at least three grown-up persons, including the official observer, during the tour, and four during the speed trials. In lieu of a fourth person, 70 kilos of ballast must be carried. All repairs during the tour may only be carried out by the driver, chauffeur, or a person nominated as such. Every repair, even though the car be in motion, will be debited with minus points.

A period of sixty minutes before the start is permitted for all necessary repairs and adjustments, taking in of fuel, oil and water, exclusive of changing tires. The valuation will take place as follows: Every commenced minute of an involuntary stop necessitated by the car or any parts will be debited 2-10 points, likewise every commenced minute during which repairs are made while the car is in motion. Repairs of speedometers will be booked but not debited. Any time taken up by repairs before the start and exceeding the sixty minutes allowed will also be debited as above. Regulations concerning the tires will follow later. After the start the taking in of cooling and brake water will be debited with 5-10 points. During the day it is only permitted to take up fuel and oil, but no water, at the dinner stations to be made known.

The speed trials will be rated according to the table yet to be published, in as much as should the car not attain or exceed the speed fixed for it as normal, it will be debited or credited for every commenced 1-10 per cent., 1-100 point on the flat, and 1-200 point on the hill climb. Should equal points be attained on the hill climb, the speed trial results will be taken into consideration and vice-versa. A ballot will decide in the second place. A competing car with more than 12 points loses rights for a prize in the speed trials.

Victor is he whose car possesses the best number of points; equal points will be decided by the flat trials result, or the hill climb.

The Prince Henry prize, a challenge trophy given by H. R. H. Prince Henry of Prussia, becomes definite property if won twice, if not the ballot will decide between all three winners.

Up to the present, the following further prizes have been presented for 1908: By H. R. H., the Grand Duke of Hesse, for the hill climb; H. R. H., the Princess Henry of Prussia, for the speed trials; H. R. H., the Hereditary Princess of Saxe-Meinnigen; the City of Lubeck. All cars completing the tour without debit points will receive a diploma.

Other particulars will be forwarded by the Imperial Automobile Club, Leipziger Platz, 16, Berlin, Germany.

LIGHT EXPRESS VANS AND EIGHT-CENTS-A-MILE TAXICABS

PARIS, Jan. 6.—In addition to the commercial vehicle contest to be held during the summer by the Automobile Club of France, a separate competition will be held in Paris and the neighborhood at the end of February or early in March for small commercial vehicles. How small they will be is shown by the fact that some of the classes will be for cabs with provision for two passengers only and not capable of exceeding eighteen miles an hour. The intention of the organizers is to produce a vehicle which will be a direct rival of the light two-passenger horse cab now familiar to all Parisians, and to develop a cheap, easily maintained commercial vehicle, which can be adopted by business houses of moderate size.

There are four classes of passenger carrying commercial vehicles, the largest being a six or seven-passenger omnibus for work between railroad depots and hotels, capable of carrying, in addition to its human load, 80 pounds of baggage per passenger. This is a type of vehicle already maintained by a number of hotels and railroad companies. Another class is for four-passenger cabs capable of taking in addition 350 pounds of baggage. High-class landaulets with provision for four passengers, without baggage, forms class three, and the last category is for small two-passenger cabs of not more than 12 horsepower and not exceeding 18 miles an hour on the level. Vehicles of this class are not called

upon to carry a registration number. Each category in the competition, which is designed specially to meet local conditions, aims at supplanting some special service now performed by horse vehicles.

Commercial vehicles carrying goods comprise motorcycles capable of taking a load of 100 to 200 pounds, small automobiles built to carry a 1,200-pound load, and larger cars for not more than 2,500 pound loads. Stringent regulations will prevent two-ton trucks taking up the maximum load of 2,500 pounds. The object here is to produce a vehicle which will tackle the horse on its own ground, which will be light, cheap, easy to keep and simple to operate.

In this connection Marquis De Dion, who ought to know what he is talking about, proposes to put on the streets a series of automobile taximeter cabs to work at the rate of five cents a kilometer, which is equal to the munificent figure of eight cents a mile. Such a scheme, if it were put into execution, would make taxicab riding the cheapest known form of locomotion, and would put buses and trolley cars entirely out of business. The Marquis brings forth figures to prove that his scheme is practicable. His vehicle would be built as light as possible, would consume little fuel, would run at ten miles an hour, work ten hours a day, and last three to five years. It would pay its driver two dollars a day, plus tips, and would cost \$900 to build in quantities.

ROYAL AUTOMOBILE CLUB AND MOTOR UNION DISAGREE

LONDON, Jan. 13.—There is a struggle for supreme control in official automobile Britain, which is not likely to end until one of the two parties engaged is wiped out of existence. The mere fact that those particularly concerned deny any bellicose intentions does not diminish the interest in the blows being given or lessen the ardor of the respective supporters of the Royal Automobile Club of Great Britain and Ireland and the Motor Union.

On the one side is the aristocratic, dignified, select Royal Automobile Club, the embodiment of British prestige, and on the other the youthful, vigorous, pushful Motor Union, strong in hope and promise.

Eight years ago the Automobile Club of Great Britain and Ireland, not then risen to the dizzy heights of royalty, absorbed an automobilists' defense association, and changed its name to the Motor Union. Its sphere of usefulness was restricted to carrying out the work previously entrusted to the Competitions Committee, and to relieving the recognized authority of some of the burden of work carried out by it for the general advancement of automobilism. There was to be no social life for the Motor Union and no interference with the club's recognized position as the automobile authority.

Early in 1904 the provincial clubs, seeing little personal benefit in the aristocratic body with headquarters in Piccadilly, put forth a scheme of federation which threatened to leave the recognized authority a mere gilded figurehead. There was a call to head off the malcontents; the Motor Union was reconstructed on democratic lines, and accepted by the provincials in place of the proposed federation. While remaining under the thumb of the Automobile Club, the Union was to advance the automobile movement in the United Kingdom, and to "extend the facilities for touring by mechanically propelled vehicles."

Three years passed and the Motor Union had grown in membership from 5,865 to nearly twenty thousand, while the more select Automobile Club had only increased its numbers by a little more than a thousand, and could not muster more than 3,375 all told.

With the growth in numbers had been a corresponding increase in activity, the Motor Union extending its operations to other fields, entering into schemes which the national club

with its royal connections did not look upon as becoming or proper, and finally had the effrontery to challenge its royal parent on its own ground. After several months of strained relations the "recognized authority" served notice on the active, youthful partner to terminate the agreement.

There were thus two bodies, one asking for the support of the provincial clubs as a king would command the respect of his subjects, the other arguing and acting with all the enthusiasm and force of a Radical candidate at election times.

The Motor Union first put out its program, offering to automobilists throughout the country legal advice and support in case of prosecution, touring facilities at home and abroad, a weekly journal, handbooks, engineering advice, a club badge, the service of scouts on the road, a central office in London, a complete library, clubrooms in two provincial centers, and special arrangements with hotels. As even an unlimited amount of prestige could not, alone, serve to attract provincial clubs, the Royal Automobile Club a few days later issued its manifesto in the form of an associate membership scheme, the associate members to have practically all that the young rival offered, and to be given all that full club members obtained with the exception of admittance to the social life of the Royal club.

The question is whether the provincial clubs will follow the lead of the Royal Automobile Club or go under the banner of the Motor Union, which has for the past few years been most intimately connected with their existence. There is little to choose between the programs. On both sides there are promises, possible of realization, which at present exist on paper only. The subscription for individuals or per head of club membership is the same for Royal club and Union, but the club proposes paying back to the county or district club a sum of five shillings per head in recognition of their local work for the benefit of motoring. Thus every person joining the Royal Automobile Club as an associate member strengthens the finances of his local club.

Already Nottingham has decided to quit the Union in favor of association with the Royal body. The Union, however, has by far the stronger position with the provincial clubs, and, if able to maintain their support, will seriously imperil the existence of the Royal Automobile Club.

INTERNATIONAL AUTO CLUBS TO PAY DUES PER MEMBER

DELEGATES at the last meeting of the International Association of Recognized Automobile Clubs, held in Paris on November 21, 1907, voted that a subscription of fifty centimes per member per annum should be imposed on all clubs, according to the minutes of the proceedings, which have just been made public. Count de Sierstorpf, the German delegate, proposed a scale of subscription at the rate of one franc per member. Baron de Zuylen, on behalf of the Automobile Club of France, put in the counter motion to the effect that the amount should be fifty centimes per member for the first year, the dues to be paid yearly by January 31.

According to the official report of the meeting, the two American foreign representatives, Messrs J. Howard Johnston and W. S. Hogan, were present at the meeting. No communication was made to the press after the meeting, but those members who gave a hint to journalists as to what had happened, declared that the United States was not represented by its A. C. A. delegates.

Although the International Association has been in existence since 1904, it has not yet had any regulations. The fol-

lowing four clauses were therefore agreed to and ordered to be sent to all interested clubs for expressions of opinion before being brought up for adoption at the next conference:

I. The limitation of the power of the Administrative Council, on which each club represented should only have one delegate in addition to the treasurer, and should only exercise one vote.

II. The quorum necessary for the validity of the votes of the general meetings, fixed at four-fifths of the clubs represented.

III. The basis upon which the subscription from the clubs be calculated.

IV. The addition of a clause providing for the summoning of an extraordinary general meeting on the request of at least five clubs.

In the discussion which followed on racing and touring conditions, it appeared to be understood that the 155-millimeter rule adopted at Ostend was only intended for such big events as the Grand Prix, Ardennes Circuit, Taunus, and Brescia circuits. One of the Italian delegates wished to arrive at a formula for touring cars similar to that adopted for racers at the Ostend Conference, and Mervyn O'Gorman, of England, moved in favor of the adoption by manufacturers of a rating which would more correctly indicate horsepower than the present description.

LETTERS INTERESTING AND INSTRUCTIVE

WHAT IS THE CAUSE OF THIS TROUBLE?

Editor THE AUTOMOBILE:

[1,113.]—I have been using for the past year a Ford runabout which has given entire satisfaction until about a week ago. I went out for a run, and as I got started the engine suddenly stopped, and on moving my spark advance lever, I could not get any buzz, as is customary from the coil. The engine seemed perfectly dead, and when I would crank it it would give one or two explosions and there would be no spark as before. I then very carefully went over all the wiring, looked at all terminals, which were all O. K., but still I got no spark, and did not get one even after I had put entirely new wires from both poles of my storage battery, which is a Vivax 6 volt 50 ampere hour one. Then I went all over my plugs and high-tension wiring, which is good. After fooling for some time, the vibrator suddenly started to buzz and the car went all right for the rest of the day, but balked the same way on the following day. I then completely rewired it, high and low tension, put in a freshly charged storage battery, cleaned the timer thoroughly, and then tried her out. As long as the throttle was closed she would go fine, but as soon as it was opened she would miss a great deal and not respond at all. I have a dash regulator for my carbureter and tried every conceivable way to adjust it, but I could not remedy the trouble, and I have written to you, thinking you might be able to help me out by some information through your "Letters Interesting and Instructive."

J. S. WEBB.

Shovan Hill, Pa.

The cause of the first trouble was evidently a short circuit or an open circuit in some part of the ignition system, which accidentally remedied itself, as is not infrequently the case, by the wire coming away from whatever it may have been touching, or by the two ends of a broken wire or poor connection coming together again through movement of the car, or similar cause. We should think that the general overhauling which you gave the ignition system on the second day would have effectually remedied any trouble there. Failure to pick up on opening the throttle with consequent missing, is very often due to faulty working of the auxiliary air valve of the carbureter. Another cause is a leak in the intake manifold or similar point, permitting an excess of air the moment the motor speeds up a bit and thus destroying the uniformity of the fuel mixture. This is one of the most puzzling ailments that the gasoline motor is heir to, and it is a difficult matter to diagnose such a case at long range. If any of the readers of this column have suggestions to offer from their store of personal experience in overcoming just such things as this, we should be glad to hear from them.

DETAILS OF A HOME-MADE, AIR-COOLED ENGINE.

Editor THE AUTOMOBILE:

[1,114.]—Will you kindly tell me in your next issue what you think of a four-cylinder air-cooled high-speed engine? I am designing one having the following dimensions:

Bore, 2 3/4 inch; connecting rod, 5 3/8 inch between; stroke, 3 inch; valves, mechanical in head; intake, 1 1/8 inch with 8-16 inch lift; exhaust, 7/8 inch, with 1-4 inch lift; auxiliary exhaust slot opened by piston, 3-16 by 1 1/4 inch; flanges (cooling) number 15; width, 5-8 inch; thickness, 1-8-inch by 1-16 inch; between bases, 3-16 inch; compression, 7-8 inch; crankshaft, 1 inch diameter; offset, 3-8 inch; journals, two 3 inch and one 3-4-inch; crankpin, 2 inches long, 1 inch diameter; wrist bearing, 1-2 inch long; wrist pin, 5-8 inch diameter; cylinders, 3-32 inch thick with removable head, held down by four 3-8-inch rods.

I would like to know if the use of picric acid in gasoline will hurt the cylinder walls of a motor or give any other bad results.

Pullman, Wash.

GEORGE D. STACY.

Without going into detail, your design and dimensions appear to be perfectly practical, but, unless you have some special purpose in mind for which this motor is to be used, we should hardly recommend building such a small motor. Picric acid is used for etching specimens of steel used for tests, so that there is every reason to believe that it will have a similar effect on the walls of the cylinder. An excess of it would be likely to generate such a powerful explosion that the motor would be blown to pieces.

EFFECT OF SPEED ON FUEL CONSUMPTION.

Editor THE AUTOMOBILE:

[1,115.]—What is the effect on gasoline consumption in driving a car over a distance, say one mile, at say 40 miles per hour; then 20 miles an hour; the gear ratios being the same in both cases? Would the higher rate of speed consume more gasoline?

Wilkes-Barre, Pa.

ARTHUR H. DENISON.

Speed has a decided effect on the gasoline consumption, and, generally speaking, the latter increases in proportion to the speed. Unfortunately there is not a great deal of data extant on this subject, but we have at hand the results of a series of experiments made by an English autoist. The car employed was a 20-horsepower machine with a touring body. At a speed of 10 miles per hour it ran 23.25 miles on a gallon of fuel; at 20 m. p. h. it covered 25.23 miles, while at 25 m. p. h. the mileage was the same as at the 10-mile speed. Increasing the latter to 35 miles an hour cut this down to 16.98 miles per gallon, from which it will be apparent that the most economical speed of the car in question was 20 miles an hour. Doubtless every car has a speed at which it covers the most ground on a minimum fuel consumption, which might be aptly termed its critical speed, only to be definitely determined by experiment.

CAN DRY BATTERIES BE RENEWED?

Editor THE AUTOMOBILE:

[1,116.]—I believe it would please many of your readers if you would state, through "Letters Interesting and Instructive" whether there is any reliable and economical method of renewing old dry batteries. I have purchased advertised formulæ and have failed utterly in the attempt to renew batteries—not being able to secure an increase of even one ampere. To refill cells with the formula containing zinc chloride, ammonium chloride, zinc oxide, and sulphuric acid is more expensive than to purchase new cells—even at the usual price of the latter, which I think excessively high (25 to 35 cents each). I am now purchasing my dry cells in lots of 40 from the surgical supply house with whom I do business—these cells are as good as any in the market and cost me only about 20 cents each delivered. Another of the advertised methods of renewing old cells is to punch holes in the covering on top of the cells and pour in a saturated solution of saturated ammoniac (ammonium chloride). This has been proved to be—in my hands at least—a fake.

Glyndon, Minn.

L. M. LOWE, M.D.

Any solution that is advertised as being an effective rejuvenator of the dry cell is in exactly the same category—a fake. The question comes up very frequently and in view of the low price at which new dry cells can be purchased it is rather strange that it should be so. There is no way—at least at present—of renewing the dry cell by pouring solutions into it. What appears to be a completely exhausted cell may be compelled to give an increased output for a short time by the use of a strong alkaline solution poured into it through holes punched in the sealing of the top. This may be sal ammoniac and water, vinegar or even salt and water, the effect being increased by heating the solution. This is a makeshift that sometimes suffices to produce sufficient current to get a car home on an apparently dead battery. For a dry cell that is really exhausted there is only one remedy, a new one, and only one place for the old one—the ash barrel.

HOW CAN LUBRICANTS BE TESTED AT HOME?

Editor THE AUTOMOBILE:

[1,117.]—We have been making a little experiment with cylinder oils and would like to know whether in your opinion there is any value attached. We took three different kinds of oil and put about a tablespoonful of each in a small tin cup and let them cook away on the top of a stove. Of course, the heat was not very great, but hot enough to cause the oil to steam. We took it for granted that the oil that cooked away first was the poorest. The writer considers that if the oil burns away inside of the cylinders it could also be burned away outside the cylinder. I have just heard from

a manufacturer and they think that the experiment is of no value whatever. Can you suggest some simple plan to test the oil without going to the chemist?
Reading, Pa. S. L. McILVAIN.

So far as what the average automobilist wishes to learn about lubricating oils is concerned, simple tests may readily be made at home without the use of any apparatus. One of the most important tests is that for acidity, and the simple experiment suggested by Henry Hess in these columns not long ago may be easily made. Take a small rod or piece of bright steel and a piece of cotton waste wicking or something similar. Wet the latter in the oil and wrap it around the steel, setting this in the sun. If the oil in question be absolutely free from acid there will be no effect visible on the steel, no matter how long it is left, but even a comparatively small percentage will make its presence known at the end of a week or so, especially in warm weather.

To test the flash point of lubricating oil, take a tin cup or other vessel to hold the sample and place this on a Bunsen burner, i. e., a blue flame gas burner such as is used on gas stoves. Place a thermometer in the oil so that the bulb is suspended in the oil and does not come in contact with the metal or other containing vessel. As soon as the oil begins to vaporize, take a lighted taper and pass it back and forth through the vapor. When the latter reaches the temperature of the flash point of the oil the vapor will ignite in short blue flashes of flame, but it will not continue to burn nor will the oil take fire.

WHICH TIRE REPAIR IS SUPERIOR?

Editor THE AUTOMOBILE:

[1,118.]—Will you kindly advise automobile owners as to your knowledge in regard to tire repairs as I state the facts to you. For instance, take an automobile tire that has a blowout and has been repaired in first-class condition, the curing being done in a sectional vulcanizer with dry heat in first-class shape. Now, take another tire of the same repair, put it on a rim with air bag. Bandage it all around, put 35 or 40 pounds air pressure in your tire. Cure tire in a retreading kettle with open steam. Which repair do you think is superior and will give the best satisfaction?
St. Paul, Minn. ANXIOUS SUBSCRIBER.

While we cannot set ourselves up as tire experts, we are strongly under the impression that what is known as the open cure process, in which the entire shoe is subjected to live steam in a sealed kettle, is considered much superior to the sectional vulcanizing process, but we are open to conviction and would like to hear from authorities whose statement is backed by personal experience and knowledge, instead of mere hearsay, as the matter is doubtless one of considerable interest to autoists at large.

IS CALCIUM CHLORIDE SAFE TO USE?

Editor THE AUTOMOBILE:

[1,119.]—Please let me have a definite answer in your "Letters Interesting and Instructive" in regard to calcium chloride as an anti-freezing solution. I notice in "The Automobile," where it spoke as though it was not safe to use, and the "Gas Power," of November, 1907, states that it is safe to use, as they have tried it four winters in an engine and could not see where it had the least sign of having ill effect on tank, engine, or any of the connections, any more than ordinary water would have. Your answer to the above will be very much appreciated by me and probably others.
Portsmouth, O. HOWARD SUTTON.

We cannot recall ever having stated in these columns that calcium chloride was in any way a dangerous substance to use as the basis of an anti-freezing solution. However, it must be borne in mind that the mere fact that a certain thing can be used successfully in connection with a stationary engine will not make it equally applicable to use on the automobile. In the former case there is nothing but iron for the solution to come in contact with, as a galvanized iron water tank is generally employed, whereas on the automobile copper or brass is used in the radiator and as the solution is in contact with the iron of the cylinder jackets and the brass

of the radiator at the same time there is danger of electrolysis if acid be present. There is apt to be more or less hydrochloric acid in commercial calcium chloride and probably this is the basis for the statement that its use might be detrimental on a car, though, as already mentioned, we do not recall just where this occurred, or in what form. The defect is easily overcome by testing the prepared solution for acidity with a piece of blue litmus paper, which can be readily obtained at any druggists. If the test show acid to be present, it may be neutralized by the addition of a little alkali such as slaked lime. The presence of the acid will be indicated by the fact that the blue strip of paper turns red as far as it is immersed in the solution. Add lime, constantly stirring to insure uniformity, until there is no longer any acid reaction on testing with the paper. This will effectually remove any risk there might be in employing calcium chloride for this purpose.

CALCULATING A MOTOR'S COMPRESSION SPACE.

Editor THE AUTOMOBILE:

[1,120.]—Would you please send me a formula for figuring the compression of a gasoline engine? For instance, if the motor is 4 1-2 bore by 4 3-4 stroke, and we want 75 pounds compression. how would you go about it?
Toledo, O. HARRY ALLEN.

The compression space of a motor is the entire area above the head of the piston when the latter is at the upper dead center. It includes the area of all ports and pockets leading into the cylinder and the amount of clearance thus depends entirely upon the design of the cylinder casting. When a charge is taken into the cylinder the volume of gas is equal to the volume swept out by the piston plus that of the compression space.

Then let V = the volume swept out by the piston, and C = the volume of the compression space. Their sum will represent the total volume of gas in the cylinder at the completion of the suction stroke, and since this is compressed into the space C the ratio of compression required to give

75 pounds initial compression will be $\frac{75}{14.7} = 5.1$, the denominator in this case representing the atmospheric pressure at sea level.

Then $\frac{V+C}{C} = 5.1$ or $V = 4.1C$. V , which is the volume swept out by the piston at one stroke, is accordingly the equivalent of the area of the piston times the stroke. This gives the following formula:

$$D^2 \times .7854 \times L = V, \text{ in which}$$

D = the diameter of the cylinder, or bore in inches.

L = the length of the stroke in inches.

$$D^2 \times .7854 = \text{area of the cylinder.}$$

Then, substituting the value of V in the foregoing equation, it will read $= 4.1C$, or

$$C = \frac{4.1}{D^2 \times .7854 \times L}$$

Substituting the dimensions of your motor in the foregoing equation will give you the number of cubic inches that must be allowed in the compression chamber to give an initial compression of 75 pounds to the square inch.

EXPLAINING THE VOLTAMMETER'S USE.

Editor THE AUTOMOBILE:

[1,121.]—Would like to ask whether a voltammeter runs down a battery as much as an ammeter?
Warren, Mass. LOWELL ELLIS.

This depends upon which part of it is used, as a voltammeter is in reality two independent instruments combined in the same case, but capable of being used separately. If the ammeter of the combination be used on a dry cell or accumulator it will run it down just as much as if an ammeter

in an independent case were used. There is no difference, other than that of their combination in one case for convenience and portability, the instruments themselves not being altered.

IN ANSWER TO THE CRITICS.

Editor **THE AUTOMOBILE**:

[1,122.]—In spite of the fact that Mr. A. S. Logan puts his claims for the utility of the "needle" in the nozzle of carbureters, in language most convincing, it does not hold that the nozzle needs such a disturbing element in its make-up. If the nozzle is thus provided, adjustment becomes a necessity, because it is extremely difficult to make the nozzle do its work under the several conditions incidental to the service. If a carbureter is otherwise improperly designed, the needle in the nozzle affords a means of relief that should be regarded as a temporary expedient; nothing more.

The nozzle cannot work in accord with the laws of the relation of the nozzle to the air, if the opening is obstructed, and that there is a law that can be taken advantage of is not to be refuted at this late day. There are hordes of the best performing cars, with carbureters in which the nozzle is free from the obstruction, and their performance is no dream. As the writer explained, once the carbureter is rightly adjusted, the needle valve ceases to be of any value at all.

As regards Mr. Logan's experience in a given case, the fact that the maker took the carbureter out and substituted another make, shows first that the carbureter was regarded as not suitable for the motor in question. This being so, to condemn the carbureter as a whole would be far more wise than to say it was the nozzle that was at the seat of the trouble.

Moreover, the fact that the second carbureter works, merely proves that the carbureter as a whole is more suitable for the purpose. Certainly the needle in the nozzle was not the redeeming feature unless the carbureter itself is of a defective design. The author purchased a motor a while back with which a carbureter was sent. In this case the needle feature was present, but in spite of it the carbureter is a flat failure, so flat, in fact, that even the maker of the motor refused to have anything to do with the carbureter. I guess he put his eye teeth in my legal tender, and regarded it as better property.

But, to show the lack of use of the needle in a carbureter that will work, it is only necessary to remove the needle and substitute a nozzle of the proper size and design.

Editor **THE AUTOMOBILE**:

[1,123.]—Lewis T. Rhoades is good enough to take some notice of my article on the subject of fuel (1,107), and if he will allow me the privilege of relating his proposition, I will agree with him. The substance of his statement is to the effect that if carbureters are made, not in view of the motor on which they are to go, but in the abstract, a needle valve is handy, even desirable, in that it affords a means of ready adaptation to the motor. I had not the slightest intention of interfering with any of the means by which make-shifts might serve a useful end. On the other hand, there is no use in going into the question of who does and who does not use needle valves in the nozzles of their carbureters, since it would be possible to name a considerable number of carbureters fitted both ways.

There is one fundamental reason why a needle valve should not be used, a reason that I will now advance, since the question is so strongly raised, i. e., no device should have more than the exact number of parts requisite to render it serviceable.

The needle in the nozzle is not essential to the working of the carbureter, hence, on the above ground, the needle might well be dispensed with.

New York City.

THOS. J. FAY.

THE RETORT COURTEOUS TO MR. POOLE.

Editor **THE AUTOMOBILE**:

[1,124.]—I am glad to be able to reply to the strictures of Cecil P. Poole (Editor "Power"), in which he takes me sharply to task about my article on carbureters, etc. Mr. Poole says: "Mr. Fay ought to know by this time that the richness of the mixture increases with increasing speed, unless special provision, such as the modern auxiliary air valve, is made to prevent it. . . ." Mr. Poole may not have observed that the article in question illustrated the very modern auxiliary air valve he says is necessary. I doubt if it is modern. I respectfully take issue with Mr. Poole, in re. the question of "better scavenging at the higher speeds!" Every indication is to the contrary! Every builder of motors has considerable trouble with them at the higher speeds, because "missing" is difficult to avoid.

The question of the timing of the spark is not one that I have taken up in my article further than to point out that the discussion assumed that such matters would be given their due measure of care. Mr. Poole may have at his disposal a very recently abridged

dictionary, telling him that it is "constriction" instead of "depression" that is required in the intake; my old-fashioned dictionary tells me that as a result of "constriction" there is "depression." It is the depression that is sought for, and to gain which the area of the intake is constricted. This matter may be further elucidated, viz.: Depression, dejected; low state; a falling or sinking; a hollow; Webster! And what will cause this state, let us see. Constrict: to draw together; to bind; to cramp. Webster.

"Combust!" is not to burn, as Mr. Poole puts it! The dictionary says: a combustible is that which will take fire. Combustion, according to the same source of information, is the phenomenon observed when the combustible is ignited, hence, a burning. Webster. I said in my article, "The carbureter, then, is intended to produce a combustible of acceptable characteristics. . . ." I do not claim elegance of diction, as the shining property of this statement; nor have I at any time, in any of my writings, claimed for my composition that elegance I so readily found in the writings of the author of "Eugene Aram." It was but a few days ago I read in some one of the many papers, that even another error was found in one of the works of "Dickens." Did they condemn the works? Far from it! the meat in the coconut is the same!

Would I be justified in condemning Mr. Poole because his recently abridged dictionary does not agree with the older copy in my possession? Does the fact that his dictionary is new make it right? The carbureter is a very ticklish device to discuss in the press! There are so very many makes to be had at every hand it is not possible to avoid treading on the toes of some one or more whose interests may be affected. Whilst it may be possible to tickle their carbureters, to perform that operation on them would be a "hair splitting" proposition, beyond the pale of human endeavor.

New York City.

THOS. J. FAY.

COMES TO THE SUPPORT OF MR. FAY.

Editor **THE AUTOMOBILE**:

[1,125.]—In your "Letters Interesting and Instructive," I note that No. 1,106, from Cecil P. Poole, does but scant justice to Mr. Fay's article on the subject of "The Fuel System of Automobiles." This in itself would not be a matter of great moment, because the carbureter is a device that has long been in grave dispute. I do not know whether I would be willing to subscribe to all that Mr. Fay said, nor am I prepared to say to the contrary.

What strikes me, however, is this: Mr. Poole, instead of setting down facts, resorts to imputations, such as would lead one to believe that his motives may not be pure. The little information Mr. Poole does condescend to hand out is a splendid display of lack of knowledge of the functions of a carbureter; moreover, if Mr. Poole's imputations are no better than the information he so kindly rattles off the reel, an "exhaustive enumeration" from him would be greatly to the advantage of Mr. Fay.

Mr. Poole's assertion: "The scavenging effect is better at high than at low speeds," would be a crime were it possible to discover anyone who would act on the suggestion, assuming damage could result! The compression is higher at the low speed, the amount of mixture is greater and the terminal pressure is higher.

With more time for the products of combustion to escape, a greater terminal pressure available, better conditions in every way, it is simply nonsense to say that the inertia of the spent mixture overbalances all other considerations, nor can it be said the inertia factor is maximum at the higher speeds.

AL. C. BERGMANN.

CONCERNING THE USE OF CORK INSERTS.

Editor **THE AUTOMOBILE**:

[1,126.]—In letter 1,060, in the January 2 issue, the writer asks your opinion as to the advisability of making "an expensive remedy for clutch trouble" proposed by his machinist, a remedy which you advise against and suggest that he do away with the leather facing and substitute cork inserts, thus making a metal-to-metal clutch with cork inserts.

As we are owners of the patents controlling the use of cork inserts in clutches and brakes and have had much experience in their use, we can assure the writer of the above-mentioned letter that the use of these inserts will eliminate his difficulty with less expense and give more permanent satisfaction than any other method of repair we know of; but we would suggest that for his purpose it will not be necessary to do away with the leather facing, as the corks can be inserted in the leather, making a composite cork and leather surface having high coefficient of friction, practically no tendency to slip or burn, and at the same time one which gives easy engagement. This type of clutch is used in the Pierce-Arrow, the Pope-Hartford, the Reliance, the York, the Garford, the Studebaker, the Oldsmobile, and many other well-known makes of cars.

Another letter, No. 1,062, in the same issue, makes a similar inquiry, and asks, "How would three cork inserts do?"

The cork inserts will give the results stated by you, but the area

of cork to leather or cork to metal is dependent on the horsepower to be transmitted, size, angle, area of face, etc., of the cone, and your suggestion that the writer correspond with the maker of the car or the manufacturer of cork inserts before proceeding is wisely taken.

While the royalty of \$2.50 charged by us does not compensate us for the time devoted to replying to the hundreds of letters received asking how the clutches are equipped with these inserts, where they can be bought, number of inserts required, etc., we have made it a point to supply the information on request and to arrange so that each individual owner who desires to have his car so equipped could accomplish this at the least possible expense, and we shall, of course, be glad to do likewise in either of the cases mentioned.

NATIONAL BRAKE & CLUTCH COMPANY,
Boston, Mass. W. W. Whitcomb, President.

NOT A QUESTION OF PATENTS.

Editor THE AUTOMOBILE:

[1,127.]—In announcing to the press the result of our test suit against the Manhattan Lamp Works for imitating the design of the Rushmore Flare Front lamp, we thought we made it clear that the case was purely in equity and against unfair competition as such. We find, however, that most of the papers are reporting the decision as though it upheld a patent on the design.

There is not, and never was, any question of a patent involved. Experience has shown design patents to be worthless as protection against copying, since the slightest departure from the design is sufficient to protect the infringer. Unfair competition, however—the copying for imitation of a shape or label or trade name, for the purpose of misleading purchasers into thinking that the imitation article is identical with or as good as the original—is quite another matter.

When a manufacturer has built up a reputation for his goods, no one has the right—patent or no patent—to endeavor to steal that reputation by palming off imitation goods as the genuine. If the substitute is as good as the original, the manufacturer of the original suffers only loss of business and the just reward of his effort. But when the substitute is inferior to the original, and is offered by some copyist without initiative and skill of his own, the injury is three-fold. The original manufacturer suffers loss of both business and reputation, since the poor performance of the substitutes tend to discredit the original, and the public buying in good faith is likewise defrauded.

The law on the subject of unfair competition is very little understood by the public in general, as the frequent copying of meritorious articles plainly shows. We regard our fight in this matter as being in support of a higher plane of business ethics, and know that we have the sympathy of the best people in the automobile trade.

RUSHMORE DYNAMO WORKS,

Plainfield, N. J.

S. W. Rushmore.

ECONOMICAL FIGURES FOR 6,000 MILES.

Editor THE AUTOMOBILE:

[1,128.]—Here is an expense account of a Ford Model N which may interest your readers. It has been run 6,000 miles, in the country and city, without being in for repairs but three times:

Car, K. W. Magneto, Pittsfield coil, Bemus timer, lamps, top, long fenders, chains, speedometer, etc.	\$850.00
Tires	75.00
Gasoline	45.00
Overhauling	50.00
(To clean out carbon three times.)	
Oil, plugs, batteries	25.00
Washing, storage on trips, etc.....	75.00

Total\$1,120.00

Answering a question published some time ago, the K. W. magneto has been very satisfactory with the Pittsfield coil, but would not work with the cheap coil on the machine at first.

You will note that this figures about 4 1-2 cents per mile, which I consider pretty good. I have never managed to operate any other machine (I have had six before) for less than ten to twenty cents. Gasoline runs as high as 27 miles per gallon, but I have figured 20 miles as an average; oil about 500 miles per gallon.

I have been much interested in the expense accounts which you have published, and a great deal seems to depend on the driver.
Cleveland, O. G. S. C.

SUCCESSFUL USE OF KEROSENE FOR COOLING.

Editor THE AUTOMOBILE:

[1,129.]—In the January 2 issue of "The Automobile" W. B. Hill writes regarding kerosene as a cooling agent. I use kerosene and have used it all winter, or rather since it has become quite cold,

and have experienced no bad results as yet. My motor never gets hot, although I have nearly half of my radiator covered to keep the oil from getting too cold. In using just pure water, I cover the radiator entirely and leave it so all the time and the water never boils. With the radiator uncovered in cold weather, my pipes will freeze on the road, having done this on two occasions. With a positive pump as the Reo car has, the writer would not hesitate to use kerosene, unless used under very severe conditions where the motor was worked to the limit most of the time. Lubricating oils soften rubber connections very rapidly if warm. I know of a gas engine company that uses nothing but oil as a cooling agent, with a gear pump, and experiences no trouble whatever. This is on traction engines of large dimensions, which are worked to the limit most of the time, being used on a gang breaking plow on the Western plains. As far as danger goes, the water system can and should be as tight as the gas tank. All that is needed is a very small vent, and this is not absolutely necessary in the cooling system providing the water does not get above boiling temperatures. Would be pleased to hear from some one who has data on flashing point of oils in pipes under slight pressure heat to be applied externally.

CECIL E. CARR.

PUTTING A VESTA ACCUMULATOR AWAY.

Editor THE AUTOMOBILE:

[1,130.]—The writer noticed, in your issue of Jan. 2, 1908, your article on page 17, in answer to an inquiry of Dr. E. C. Lee, of Duluth, Minn., asking for information regarding the care of the Vesta battery during the winter.

You, evidently, are not very well posted on the Vesta sparking battery, and as a consequence you gave instructions for the general care of a power battery, such as is used on the electric automobile and in power plants.

All that is necessary in taking care of the Vesta battery during the winter, when not in use, is to set it away fully charged and to keep it in a room of moderate temperature. It is advisable, if it is set away for a longer period than three months, to freshen it up at the end of three months, by giving it one-half a charge and then when ready for use in the springtime have it charged again. No injury will result to the battery if cared for in this manner.

We trust we have explained ourselves clearly in the matter, and remain,
VESTA ACCUMULATOR COMPANY,
Chicago, Ill. Ward Perry, Secretary.

AN APPRECIATION FROM A WESTERN AUTHOR.

Editor THE AUTOMOBILE:

[1,131.]—This is not for your "Letters Interesting and Instructive," asking how to make an old 15-horsepower do the work of a modern 40-horsepower by cleaning the spark plugs or changing the ratio, which is such a pet scheme for creating power with some of your correspondents, but the author of the booklet from the Lima (Ohio) Automobile Club, on the subject of "Highway and Road Etiquette," wishes to thank you for the overgrown compliment which you have paid me by republishing my entire work in your valuable and widely circulated magazine, of which I have long been a faithful reader. The original object in writing the book was educational in a local way only to stimulate a desire for better roads among our farmers, and to try to teach them how to make a quick side step on the approach of an automobile without compelling us to hold out the clutch while they decided whether they would let us pass to the right or to the left—or not at all; but if it can serve a similar purpose in a broader sphere, it is a double recompense for services rendered.

Lima, O.

CHAUNCEY F. LUFKIN.

SATISFACTORY SERVICE FROM DRY CELLS.

Editor THE AUTOMOBILE:

[1,132.]—I noted with interest the remarks that your correspondent makes who signs himself H. W. in letter No. 1,090, as I have myself received perfect service from dry batteries since I introduced a well made coil in my car, which does not draw over 1-4 ampere if properly adjusted. H. W. states he ran 1,600 miles on a set of batteries with the coil drawing 3-4 of an ampere, and I would advise him to make another test with his coil readjusted, drawing only 1-4 ampere. I have yet to find an engine of any compression which will not perfectly work on this consumption, and some manufacturers even claim that perfect results have been obtained as low as 1-20 of an ampere.

Through my garage experience I can say that almost universally those complaining of unsatisfactory results from dry cells have not the slightest idea of the coil consumption or the condition of the wiring, and, therefore, batteries are blamed where the fault lies elsewhere.

New York City.

C. R. B.

MITCHELL 35-HORSEPOWER TOURING CAR, TYPE I.

IN order to meet both the price and quality demand of a very large class of purchasers, it is essential that production be both systematic and on a large scale so as to insure a moderate initial cost. This is something the makers of the Mitchell, the Mitchell Motor Car Company, Racine, Wis., have done, and the nature of the changes made on the cars of the Mitchell line for 1908 are indicative of consistent adherence to a well-outlined policy of manufacturing. For instance, an increase in the comfortable riding qualities of the cars has been brought about by a slight lengthening of the wheelbases, the touring car now measuring 112 inches on the ground as against 108 last year, while the 1908 runabout has been lengthened two inches, giving it a wheelbase of 92 inches. The gentleman's roadster, or Model G, is mounted on the same chassis as the runabout. The same running gear and tire equipment as that which has proved so satisfactory on these models during the past year or two remains unchanged, and it may be observed here in passing that this is one of the chief faults of many an otherwise clever designer—the abandonment of well-tried-out devices and dimensions for something new and unknown, frequently for no other reason than that it is new.

In the line of improvements, that most important essential of any car—the braking equipment, has come in for due attention. In the touring car model of the year previous, the brake drums measured 10 1-2 inches and have been increased by four inches in the 1908 models, while the runabout brake drums have been increased from 9 to 10 1-2 inches. The braking system employed is that of the combined external contracting and internal expanding brakes acting on the same drums attached directly to the driving wheels. All brake shoes carry a friction facing of fiber, experience having shown this material to be very satisfactory in service. The suspension has not been overlooked, and on the 1908 models all springs are now two inches wide and are banded, no center holes being drilled. Universal joints have been protected by a combined steel and leather casing which is both oil and dust-proof. The same type of change-speed gear has been retained, but a much better grade of material employed throughout, from

which it will be evident that it is the designer's constant aim to adhere to a consistent policy of betterment by building on the well-tried-out foundation already in hand, than to strike out into new and unknown fields, as is so often done, frequently for no other reason than to gain talking points. The rear axles have not been changed in any way, the design and material having proved perfectly satisfactory in the preceding models. Front axles, while of the same materials, have been designed to allow the chassis of each model to hang two inches lower, though the road clearance in every case remains unaltered. This change is responsible for the improvement in the suspension made in the present year's models.

The refining process has been carried out in the motor in the same painstaking manner and with the same close attention to detail that characterizes the other improvements of the car. The camshaft diameter has been increased from 3-4 inch to 7-8, the cam face being made one inch wide, while the applied middle bearing of the camshaft in the 1907 model is now made integral with the motor base. The cap is secured with a screw bearing on a stiff spring, to prevent the application of injurious pressure to it. Two minor changes have been made in the valve operation, which is of the direct type on the intake and of the overhead type on the exhaust, the latter being placed in a cage in the center of the cylinder head and worked by a vertical push-rod, screw-adjusted for length in the top fork and having its lower end dropped into a cup in the upper face of the cam roller carrying lifter. The lifter has been made slightly longer and its diameter increased, permitting the push rod cup to be formed directly in the end of the lifter. The intake valve stem has also been given a screw length adjustment. The timing idler used

between the crankshaft and camshaft has been eliminated, the former pinions having been made large enough to engage directly. The hinged rod cap on the crank wrists has been replaced by a full marine type retained by two studs with lock nuts. The bore of the 20-horsepower motor has been increased from 3 3-4 to 4 inches.

Where the transmission is concerned, the cone clutch has been fitted with six

THE MITCHELL GENTLEMAN'S ROADSTER FOR 1908.

VIEW OF DASH AND CENTRAL PORTION OF CHASSIS.

springs to insure gradual engagement. The pinions of the gear-set are now made of special oil-tempered steel of 6-8 pitch, it having become standard practice to make gear teeth for this purpose shorter than standard lengths, thus gaining in strength by saving outside diameter as well as in machine work. The shafts are carried in babbitt bearings supported in an aluminum housing with cast-iron cover, the latter adding rigidity to the lower member.

The front axle is an I-beam section of drop-forged steel without welds and using the Lemoine type of stub axle support. Two-point adjustable ball bearings are used, the balls measuring 1-2 and 3-4 inches, respectively. Hyatt roller bearings are used on the rear axle except on the inside bearing of the bevel pinion shaft, which is an annular ball bearing, while all thrusts are taken on ball disks. The differential gear is of the spur type, employing eight pinions. The control is of the standard type throughout and reveals but few, if any, material changes over that of the preceding models. Instead of equalizing the brakes in the usual manner, the pressure applied to each brake shoe is regulated independently by a screw adjustment readily accessible when the footboards are lifted. The steering gear is of the worm and segment type, the spark and throttle levers being placed in front of the column. As the result of the great demand for Mitchell cars last year, the manufacturers found it necessary to increase their facilities substantially, with the aid of which they plan to turn out 2,200 pleasure cars and 120 motor trucks during the coming season.

CARBURETOR SIDE OF MOTOR SHOWING VALVE MECHANISM.

NEW TYPE OF FRICTION TRANSMISSION.

This is a device intended to act as a means of changing the ratio of the speed of the motor of an automobile and its driving wheels, and to transmit the power of the former. It is the invention of J. U. Baker of Stoutsville, O., and differs considerably from the usual type of friction transmission now employed for this purpose. It consists of an angle steel frame, carrying a friction disk at each side. These disks each have two bevel faces and are mounted in extension bearings. The bevel faces on the disks are spaced five inches apart at their outer edges, admitting the insertion between them of the speed cones, which are mounted on an extension of the propeller shaft, the latter being supported by three bearings, two of them on the ends of the frame, and a center bearing mounted on a pillar supported by a longitudinal bracket beneath the center of the frame.

The primary section of the driving shaft extends from the motor to a point just inside the outer bevel surfaces on the disks. At this point the drive shaft bears a cone keyed to it,

THE BAKER FRICTION TRANSMISSION, SHOWING THE SPEED CONES.

this cone entering and engaging the cup cone keyed on the end of the driving shaft just in front of it, as will be seen upon reference to the photographic view of the device in which one of the friction disks has been removed in order to illustrate its details and manner of operation. This cup cone is in reality two cones, containing a smaller inverted cone at the bottom of the hollow of the first. The tapered end of this inverted cone extends outward and engages in the recess of the first cone mentioned, thus giving a double V-shaped locking engagement which gives the direct drive on high speed. On the propeller shaft, opposite the outer bevel surfaces of the disks, is mounted the primary cone, which is movable on a feather and is brought into engagement with the two outer surfaces of the disks.

By a double acting lever arrangement, the larger and inner cone keyed to the end shaft comes into engagement with the inner bevel surface of the disks at the same time that the primary cone engages, thus producing a speed reduction between the motor and driving wheels in the ratio of 3.25 to 1. For reversing, a pedal-operated lever brings the primary cone into engagement in conjunction with the larger cone mounted on the rear portion of the driving shaft, this cone also sliding on a feather. The shaft-locking or coupling device is operated by sliding the rear section of the driving shaft forward by means of the speed lever attached to the yoke mounted on this part of the shaft.

ONE of the chief improvements to be found on the Premier cars for 1908 is the adoption of low-tension ignition on Models 30 and 45. A Bosch magneto is used as a source of current supply and the arrangement of the system is of particular interest. Long pitch spiral gears are located on the intake camshaft, so arranged as to drive the vertical shafts on which they are placed, the cams operating to make and break hammers. The vertical shafts are in two parts, the lower end carrying the spiral gear being journaled in the crankcase, while the other end carries the cams and is journaled in a Hess-Bright ball bearing, the latter being located on the cylinders directly under the cams. A three-jaw clutch coupling joins the two parts of the shaft which are marked so as to facilitate their reassembly without disturbing the ignition timing. The pitting of the electrodes common in such systems has been obviated by making both contacts of liberal size and employing iridium-platinum, which is fastened by brazing with pure copper.

One of the distinctive features of this ignition system is the method of cushioning the contact, a patent having been applied for on the device employed. By this means, the wear of the igniter points, bushings, cam rollers, cams and other moving parts is automatically compensated for, besides which it provides a hammer giving a large spark at lower motor speeds, which greatly facilitates starting. The spark occurs right in the path of the incoming gas, as the points are located directly over the inner edge of the inlet valve. To electrically connect the different igniters, a 1-4-inch brass rod, protected by a fiber tube, is employed, together with small knife switches. The auxiliary ignition system is of the high-tension type, employing an improved type of secondary distributor and single vibrator coil especially designed to stand constant hard service. Both systems are advanced at the same time and in

the same ratio by a single lever located on the steering wheel, and each can be independently adjusted.

Though this is one of the chief features of distinction between these two models of the Premier and their predecessors, they also incorporate numerous others, such as the twin-cylinder castings with independent water jackets, thus gaining the advantages of uniform expansion as with independent cylinders without the extra water connections necessary on the latter. The valves are of nickel-steel and work in easily renewable bushings. Instead of the double or triple "Y" type of manifold ordinarily employed, the cylinders are provided with a longitudinal intake port beneath the valves, the mixture being introduced through flanged "T" fittings, thus making the connections very short and providing equal suction for each cylinder. This gives the effect of heating the intake by water jacketing and prevents condensation at low speeds. The "T" connections between the pairs of cylinders are equipped with slip-joint stuffing-boxes. Aluminum cover plates are employed on the large openings in the jackets, thus permitting access to the entire interior while their fastening of small machine screws prevents damage from freezing, as they would readily give way long before the pressure became sufficiently great to endanger the cylinder casting itself.

MOTOR FROM MAGNETO SIDE SHOWING IGNITER SHAFTS.

Another feature of note is the use of a pressed steel oil pan divided into two compartments in the four-cylinder and three in the six-cylinder car, to form the bottom of the crankcase, a mechanical force-feed lubricator being located under the bonnet in close proximity to the exhaust pipe, and feeding to the cylinders just below the second piston ring when the latter is down, the other bearings being taken care of by the splash lubrication of the independent oil compartments. A feature

TOP VIEW OF TWO-CYLINDER UNIT WITH IGNITER DETAILS.

that will be found of great convenience by the user of the Premier is the provision of a bull's-eye showing the oil level in the splash compartments. With regard to the remainder of the motor, the pistons are cast from selected gray iron and chilled inside. After being roughed out all over they are annealed and set aside for some time, each piston then being ground to exact size with a slight taper at the upper end. Four rings are employed. The connecting rods are I-beam

BOTTOM VIEW OF MOTOR, SHOWING LIBERAL SIZED BEARINGS.

drop-forgings, the main bearings consisting of Parsons white brass bushings held in place by cap screws and lock plates. Drop-forging, rough turning, special heat-treatment and finishing on the grinding machine are the various processes through which the crankshaft is put. It is of large diameter and of special steel. The upper half of the crankcase is of close-grained cast iron, and while slightly heavier than aluminum, it provides a rigid support for the cylinders as well as the crankshaft and camshaft.

A Weston multiple disk type of clutch forms the first step in the transmission, and is employed with a direct pressure spring. The connection between the clutch and gear-set is through a hardened floating shaft squared within the forward end of the clutch spider and having a three-jaw clutch-coupling at its other end, the jaws being slightly spherical and thus acting as a universal. Final drive is by shaft. Some of the other specifications are pressed steel frame, I-beam drop-forged front axle, Lemoine steering knuckles of vanadium steel, crucible steel rear axle housing, Hess-Bright annular ball bearings in gear-set and wheels, Schwarz wheels, long semi-elliptic springs front and full-elliptic rear, honey-comb radiator of autogenously welded tapered copper tubes,

and extremely liberal and well-designed braking equipment.

In the case of practically every one of these features the detailed specifications would be of considerable interest did space permit of enlarging upon them. For instance, the radiator is fastened to the forward end of the frame by reinforced bronze brackets, the whole being mounted on a rubber cushion, while the top of the radiator is not fastened in any way, thus preventing distortion. Circulation is by means of centrifugal pump gear-driven by a fiber pinion inclosed in the crankcase. The water connections are made of autogenously welded copper tubes of smooth interior and have been designed of such generous size that in case of stoppage of the pump the water would circulate freely by the thermosyphon action. A feature of the radiator itself is the provision of a large expansion tank, thus preventing waste when the motor is raced suddenly. A drain cock is inserted in the pump suction pipe, this being the lowest point, so that it permits of draining the entire system.

The brakes are likewise worthy of special mention for

THE SUBSTANTIAL REAR AXLE UNIT WITH ITS STEEL HOUSING.

more reasons than one. Two systems are employed, both being applied to drums measuring 14 7-8 inches diameter by 3-inch face, made integral with the hubs. The foot brake is pedal operated and consists of an internal expanding bronze ring, each ring carrying 44 cork inserts 1 1-8 inches in diameter compressed into 3-4-inch holes. The expansion links employed caused the braking ring to be carried centrally when not in use, thus eliminating any drag. The emergency brake is lever-operated as usual, and consists of a contracting band lined with camel's hair belting. Both brakes are equalized by means of pressed steel brake beams sliding in reinforced slots in the sides of the frame members, thus giving an equal amount of resistance at each rear wheel and minimizing the tendency to skid when braking. Provision is made for very easy external adjustment for wear on both sets of brakes, this being a feature long needed on the average American car.

BRAKE DRUM ASSEMBLY SHOWING LARGE NUMBER OF CORK INSERTS.

THE SELDEN A BRAND NEW COMER FOR 1908

LAST week there arrived in New York one of the first of the new Selden cars, which are now being built at Rochester, N. Y., by the Selden Motor Vehicle Company. The car is the work of E. T. Birdsall from beginning to end, and to those who are familiar with this de-

DESIGNER E. T. BIRDSALL IN THE NEW 30-HORSEPOWER SELDEN.

signer's career in the automobile field and his achievements before entering it, this in itself is a sufficient guaranty of its worth. But the car speaks for itself far better than the reputation of any builder or designer alone possibly could, and the first question that those who have had an oppor-

tunity of looking the new production over, have given vent to, is "How do you do it?" and then as an after thought, "How long are you going to do it that price?"

But, as a keen observer of automobile conditions in this country, Mr. Birdsall has carefully studied every detail of the matter. "There is no intention on our part of selling the first series of cars at this price, and then, as soon as people know what they can do, of jumping it," said Mr. Birdsall in an interview.

Built to sell at \$2,000 in complete running order, the new 28-30-horsepower Selden represents the materialization of a well-known designer's ideas of what the medium-priced car should be, and there is no question whatever in the minds of any of those who have seen the car and ridden in it that he has struck the nail fairly on the head. The engine is of the four-cylinder vertical type, with cylinders cast in pairs, valves all on the right-hand side operated from a single camshaft by the direct thrust method.

For ignition one of the new Splitdorf four-unit, non-vibrating coils with a master vibrator is employed in connection with a set of accumulators, a Schebler taking care of the essential of carburetion. The transmission consists of a leather-faced cone clutch, a three-speed selective gear set and shaft drive.

CHICAGO NOW THE HOME OF A NEW STEAMER

IT has long been reported that the American automobile world was soon to see a new steam car from the hands of Webb Jay, the former racing driver, whose experience with this type extends over a number of years, but no hint of what the newcomer would look like has been allowed to leak out, so that the accompanying photograph of this entrant into the steam ranks, which claims Chicago as its home, reveals its lines for the first time. It is known as the Webb Jay Steamer and is considerable of a departure where this type of car is concerned, as the entire power plant has been installed beneath the bonnet forward without making the latter unduly long or bulky. As a matter of fact, it bears more of a resemblance to a six-cylinder gasoline car than anything else, and the employment of a double side chain type of drive, which also represents a radical departure in this field, further carries out this idea. Moreover, the control, centered on the steering wheel in much the usual manner, is also patterned more or less closely after standard practice in the gaso-

line field, so that the car is apt to deceive even those observers who are accustomed to give more than a casual glance to such matters when they see a new car for the first time. A graceful and roomy body of the straight-line type is fitted, and the whole car is well-proportioned and attractive, as will be evident upon reference to the accompanying photograph of one of the first of the new Chicago productions.

STRIKINGLY ATTRACTIVE LINES OF THE NEW WEBB JAY STEAMER.

STUDEBAKER BUILDS ELECTRIC BANK WAGON.

The National Bank of Commerce of St. Louis, Mo., has recently put into commission an electric bank wagon which was built for it by the Studebaker Automobile Company, of South Bend, Ind. The body was built upon the bank's specifications. A door opens on each side in the center. Just in the rear of the driver's seat and extending under it, and wholly inside the body, is located a strong box made of wood and lined with heavy sheet steel.

AUTO PATROL WAGONS POPULAR.

INDIANAPOLIS, IND., Jan. 20.—One department of activity in which the commercial vehicle is daily gaining ground is that of municipal service and particularly as an aid to the police. A large number of American cities have already adopted automobile patrol wagons, the latest of these being Indianapolis. Last summer the Department of Public Safety in the latter city made a very thorough test of a Rapid commercial car, and as a result have decided to purchase three of them for regular police service. The tests extended over two days, from noon August 17 to August 19, in which time 51 runs were made. The average trip was 29.3 blocks and the average time consumed in making the trip was 11.5 minutes. This included getting under way by starting the dead engine, which required eight seconds on the average, loading the prisoners, telephoning to headquarters, and the like. Another feature of the tests was the economy shown by the car, as a total of 185 miles was covered on 12 gallons of gasoline, an average of 15 1-2 miles to the gallon, making the cost for fuel 1 4-37 cents per mile—a most excellent record for a commercial car of this size.

RAPID MOTOR VEHICLE COMPANY'S LATEST PATROL WAGON.

STODDARD-DAYTON ADDS SPECIAL LANDAULET.

An interesting type of automobile designed for service in towns has been produced by the Dayton Motor Car Company, Dayton, Ohio. As will be seen from the illustration, the car is fitted with a special type of landaulet body for two persons, and has many features which recommend it for use by physicians, ladies shopping or visiting, or the numerous services of a town carriage.

Model 8N, as it is known in the Stoddard-Dayton catalogue, has as its motive power a four-cylinder engine with cylinders cast in pairs and measuring 3 7-8 by 3 3-4 bore and stroke. From these are obtained 18 horsepower, quite sufficient for a vehicle of this nature, designed to carry comparatively small loads and be economical to maintain. Transmission is of the selective type, giving three speeds forward and reverse, clutch is leather-faced cone type with ball bearing spring thrust and ball bearing clutch thrust; drive is by propeller shaft and rear live axle. The pressed steel frame, made in the company's own factory, is mounted on semi-elliptic springs, 36 inches in front and 46 inches in the rear. Wheelbase is 101 inches and road clearance 9 inches. A very complete equipment comprises gas lamps, side and tail lamps, horn, generator, tools, etc. Total weight of the car is 1,400 pounds.

MODEL 8N STODDARD-DAYTON SPECIAL LANDAULET.

CLAIMS THE ECONOMY MILEAGE MEDAL.

"Fifty thousand miles in my 'Old Husky,' a Rambler 1904 Model, at a cost of only \$200 for upkeep," says W. W. Watts, a Los Angeles autoist. Mr. Watts is an architect and builder, and supplementing the above brief but rather pointed statement of his record, says: "I would like to challenge any American autoist to furnish proof of a better mileage and economy record. Thomas B. Jeffery & Company, Kenosha, Wis., manufacturers of the Rambler cars, will act as sponsors for Watts, who has deposited with them proofs of his mileage covered in four touring seasons, as well as an itemized account of his expenditures for maintenance.

By virtue of his record, which is the equivalent of twice round the world, Mr. Watts may demand the presidency of the Rambler Fifteen Thousand Club, an organization of Rambler owners who have driven the same Rambler car 15,000 miles or more. Mr. Watts purchased his car in Los Angeles in May, 1904, and, in a country where long trips are possible every day in the year, piled up an average of 12,000 miles very season, no obstacles being considered too great to be overcome. He says he will drive the "old tub" another season and maybe longer, so that by the time the old car finally gives way to a more modern successor, it will have achieved enviable records in more ways than one.

SOUTH AMERICAN MARKETS FOR AMERICAN AUTOMOBILES

By J. A. LORD.

FEW of our automobile manufacturers are apparently aware of the excellent market for cheaper grades of cars which is open to them in most of the cities of the east coast of South America. If they are, it is unfortunate to be compelled to record that results show that they have not, up to the present, taken advantage of their opportunities. Few good roads are found in South America outside of the municipal limits, but most of the cities, which spread over large areas, have level, well-paved and shaded thoroughfares, affording excellent roadways for the automobile.

The South American likes anything showy, or stylish, or out of the ordinary, and a small business runabout either for two or four persons will find a ready sale. The ability to attend to business under circumstances different from general customs appeals to these fastidious peoples and the only reason why there are not more autos in use seems to be on account of the backwardness of our auto manufacturers in entering a field offering so many and good opportunities.

On the Amazon and its delta there are but two cities—Manaos and Para—likely to use the automobile. At Manaos, fifteen hundred miles from the Amazon's mouth, there are elegant streets to be found and many rich rubber merchants are ready and anxious to buy a good machine. At Para, one hundred and thirty miles from the mouth, most beautifully shaded streets lead out into the suburbs where are located the zoölogical garden and the Rodriques Alves Bosque, the latter being a park more beautiful and almost as large as Central Park.

Pernambuco could probably use a dozen machines of small cost on its shaded and fairly well-paved streets. There are a few good, but short, drives outside of the city limits. Further down the coast, San Salvador (or Bahia, as we know it), is a city which in reality is two cities. The commercial section is at sea level and the retail and residential section is on a level elevation reached by steep hills for wagons and elevators and inclines for passengers. At Bahia there are long, elegantly paved streets in the upper city, most of which lead to beautiful roadways extending along the ocean, affording magnificent marine views. There is no doubt but that our manufacturers would find a ready sale in this city.

But the best automobile markets, the ones from which large returns should be realized, are farther south at Rio de Janeiro, Petropolis and Sao Paulo in Brazil and Buenos Ayres in Argentine. Rio de Janeiro and its mountain suburb, Petropolis, will gladly welcome the advent of the American autos. European manufacturers have agencies at Brazil's capital, but their prices have been placed so high that they are almost prohibitive, though there are upwards of two

hundred autos, including two large auto 'buses, in use in Rio de Janeiro at the present time. Several auto 'buses are now in the course of construction and delivery. A two or four-seated car adapted to both business and pleasure and offered at the proper price is in demand at the present time both at Rio de Janeiro and Petropolis.

Sao Paulo and Bello Horizonte, the first the greatest coffee-growing center of the world and the latter the capital of the State of Minas Geraes, offer rich markets for the pleasure car builder. Sao Paulo has many rich coffee fazendeiros, or coffee growers, who would use their cars in regularly visiting their coffee fazendas or farms. Bello Horizonte's residents consist mostly of those natives who have become wealthy from Minas Geraes' resources. No earnest development of the State of Minas Geraes has been prosecuted up to the present time, and yet in a few years many poor people have become rich in simply "scratching the surface" of its precious stones, gold and silver.

No better market for a limited number of cars could be wanted than at Montevideo, the capital of Uruguay. Its miles and miles of modern streets connecting with the most magnificent country roads one wishes to ride over afford excellent trackage for automobiles. At Buenos Ayres and Rosario possibly the best American market is open to competition. There are many European cars here, and an old-world company is about to inaugurate a taximeter cab service in the former city. Nevertheless, the writer was asked many times while in Buenos Ayres, three months ago, why our American auto builders do not offer their products for sale in that city.

At Rio de Janeiro and Buenos Ayres and, to a limited extent in Montevideo, many auto freight trucks are needed. Rio de Janeiro should have a taximeter cab service at "popular" prices. An auto-'bus line similar to that which is in operation on Fifth avenue, New York, would net most satisfactory returns should it be put in operation on the main thoroughfare in Buenos Ayres. At the present time there is only one American car being pushed energetically in South America, and this demonstration has only been going on for about three months.

Our automobile manufacturers should investigate the possibilities open to them in this fertile field. Good returns will be realized if they will only have the courage and patience to fight against all kinds of apparent deterring contingencies which in the end are no harder to overcome than the troubles experienced and mastered in domestic trade, if the distance of six thousand miles is taken into consideration as the stepping stone between the producer and the consumer, and with agents on the ground this is not such a great obstacle.

AMERICAN AUTO OMNIBUSES IN JAPAN.

United States Consul George H. Scidmore reports that the Soshin Motor Car Company began operations at Nagasaki, Japan, on November 4 with two auto omnibuses, manufactured by Knox & Co., of Springfield, Mass. The line of travel is confined to the level roads along the water front and up the valley to the suburb of Urakami, a distance of nearly three miles. An increase in the number of vehicles and length of route is expected at an early date. Owing to the very hilly surface and narrow and undeveloped character of the roads in this part of the Japanese island of Kiushiu, some time must elapse before improvements will permit an extensive use of motor vehicles. Their speed is restricted to eight miles per hour within city limits.

TRIAL OF RENARD MOTOR ROAD TRAIN.

A report from U. S. Consul Alfred K. Moe states that there was recently tried in Dublin the new Renard road train, and that those interested in the problems of transportation in Ireland, apart from the railway companies, regarded it as having great possibilities for the development of the island.

"The difficulty of transportation, both as regards freight and passengers in Ireland, the high rates and fares, and the very inadequate service supplied by the railways, offers a choice field for the first individual or company with courage and money enough to develop a system which will give the people of Ireland a chance to become factors in the agricultural and industrial life of the country, from which they are at present excluded by excessive railway charges.

"SHOW-ME" STATE AUTOISTS WILL TOUR SOME

ST. LOUIS, Jan. 20.—Thoughtful Missouri autoists are anticipating this year a period of reconstruction in the automobiledom of the State; for, since the death of the drastic motor vehicle law which only permitted the use of a motor-driven vehicle throughout the State for something like \$342 annually and the coming of a new law which gives an enlightened form of State registration, the man who drives

CRYSTAL SPRING SUPPLIES BOTH MACHINE AND BEAST.

a car in the "Show-Me" State has begun to feel emancipated. Since automobiling in Missouri has been healthy and vigorous in spite of opposition from farmers and indifferent roads—to say nothing of the law—there is every reason to believe, now that the sort of automobiling slavery which has been so hard to bear has passed, that the new order of things will bring forth conditions which will delight the tradesman and the enthusiast alike.

St. Louis autoists are still under the ban of a city tax of \$10 per year, but car owners have been paying this long enough to become accustomed to it, and it is as nothing compared to the restrictions of the past in the form of separate taxes for each county in which one wished to drive his car. St. Louis is peculiarly situated, so that it is not in any county, so that formerly whenever one wished to drive outside the city limits he had to be provided with a county license according to the direction in which he wished to go. To pass out of the city on the north or west, it was necessary to have a St. Louis county license; if he went South, he found that unless he had a Jefferson county license he would be held up by a deputy, or a constable, before he had journeyed far. To drive some fifty miles north, west or south he had to provide himself with other licenses. The annual cost of such county taxes varied from \$2 to \$3, according to the local interpretation of the law. In order to drive in every county in the State he was liable to a yearly tax, which at the rate of \$3 per county, amounted to \$342, and that amount did not include the city license.

The State registration act was not passed until after a hard three-years' fight on the part of the St. Louis and Kansas City clubs, and even when the victory came many autoists could scarcely realize it—they had almost become used to it. But they are fully awake to the possibilities of it now, and, the restrictions gone, they are looking forward to the spring and summer with better opportunities for exploring unknown roads and sections where the automobile has scarcely been seen. Those who have been in the habit of shipping their cars to the East for the summer months are contemplating changing their plans this season and see something of their own State under the new régime.

A well-known capitalist the other day was asking your

correspondent's advice about buying a new car for himself. "What do you want to use it for?" he was asked.

"I want a car that I can run to Kansas City with—one that will be comfortable and will stand up over Missouri roads. I am tired of touring around in the East, where there's a 'six-miles-an-hour' sign on every telegraph post and a police trap on every decent stretch of road."

Such is the new Missouri spirit.

Promise of future activity in out-of-town driving has been shown, since the enactment of the registration law, in the larger use of such splendid macadam highways as the De Soto pike—famous in the old bicycle days—the Manchester road, the St. Charles rock road, and the Gravois road. The De Soto pike and other roads in Jefferson county were practically boycotted by St. Louis automobilists under the old law because one county license was about all anyone cared to provide himself with, and St. Louis county was chosen because it provides the greatest number of good roads. Now the run to De Soto is one of the most popular, while many who in the past never crossed the Missouri river now push into St. Charles county and even beyond. The De Soto pike provides a splendid demonstrating run with its long hills. One section of this road is composed of two hills that form an acute angle, each leg of which is fully a mile long. If one drives through St. Charles county over dirt roads—with, possibly, a ford or two—and along the Quiver river bottom of Lincoln county, into Pike, he will find the justly celebrated roads of that county. A great many have been in the habit of avoiding the picturesque, though unreliable, route through St. Charles county by taking their cars on board a Mississippi river steamboat at St. Louis and landing at Hannibal.

Let it not be imagined for an instant that the automobilist in Missouri is free from the pestilence of the man with a deputy's commission in his pocket, who seeks to make a living off of automobile enthusiasm. His trade has been a lucrative one for several years, and the motor vehicle law, although favoring autoists, has not retarded his business. That the attitude of the country gentry is not as menacing or as violent as it was a year ago is, however, true, and the automobilists feel safer and in every way more comfortable outside the city limits than ever before.

TYPICAL MISSOURI ROAD LEADING OUT OF ST. LOUIS.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Feb. 1-8.....—Providence, State Armory, Automobile Show. Frank M. Prescott, manager.
- Feb. 3-8.....—Kansas City, Mo., Convention Hall, Automobile Dealers' Association of Kansas City.
- Feb. 10-15.....—Detroit, Light Guard Armory, Tri-State Automobile and Sporting Goods Association, Seventh Annual Show.
- Feb. 17-22.....—Cleveland, Central Armory, Annual Show, Cleveland Automobile Dealers' Association. George Collister, manager.
- Feb. 21-29.....—Newark, N. J., Electric Park Auditorium, New Jersey Automobile Trade Association and New Jersey Automobile and Motor Club.
- Mar. 7-14.....—Boston, Mechanics' Building and Horticultural Hall, Boston Automobile Dealers' Association. Chester I. Campbell, manager, 5 Park Square.
- Mar. 11.....—Boston, Bay State Auto Association Clubhouse. First Quarterly Meeting, Society of Automobile Engineers.
- Mar. 9-14.....—Buffalo, Convention Hall, Sixth Annual Automobile Show, Automobile Club of Buffalo. Dal H. Lewis, manager.
- Mar. 21-28.....—Toronto, Canada, St. Lawrence Arena, Automobile Show. R. M. Jaffray, manager.
- Apr. 5-12.....—Montreal, Canada, Arena, Third Annual Automobile and Sportsman's Show. R. M. Jaffray, Mgr.

Motor Boat Shows.

- Jan. 25-Feb. 1.—Boston, Mechanics' Building, National Association of Engine and Boat Manufacturers. Chester I. Campbell, manager, 5 Park Square, Boston.
- Feb. 3-8.....—Buffalo, Convention Hall, First Annual Power Boat and Sportsman's Show, auspices of Buffalo Launch Club. Dal H. Lewis, manager.
- Feb. 20-Mar. 7.—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsman's Show.

Race Meets, Hill Climbs, Etc.

- Mar. 2-7.....—Ormond-Daytona, Fla., Automobile Club of America.
- Mar. 16-21.....—Savannah, Ga., Savannah Automobile Club.
- Apr. 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
- May 4-5.....—Harrisburg-Philadelphia and Return, 150-mile Endurance Run, Motor Club of Harrisburg.
- May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.

FOREIGN.

Shows.

- Jan. 13-Feb. 2, '08—Turin, Italy, Fifth International Automobile Exhibition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.
- Mar. 21-28.....—London, Agricultural Hall, Cordingley's Show.
- May 6-20.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.

Race Meets, Hill Climbs, Etc.

- April 1-13.....—Monaco Motor Boat Races and Motor Boat Exhibition, International Sporting Club of Monaco.
- April 25-May 25—Industrial Vehicle Competition, Automobile Club of France.
- May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
- May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
- June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club of Germany.
- July 1-15.....—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.) Single and two-cylinder runabout race on preceding day.)
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- July 20-30.....—Ardennes Circuit Races and Coupe de Liedederke, Automobile Club of Belgium.
- Aug., 1908.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
- Sept. 1-8.....—French Volturette Contest, auspices of "L'Auto."

BOOKS FOR AUTOMOBILISTS.

A. L. A. M. Fifth Annual Handbook.—One hundred and fourteen different models and types of cars are shown in the fifth annual handbook published in an improved and more handsome form by the Association of Licensed Automobile Manufacturers. The descriptions and illustrations deal with all American cars licensed under the Selden patent, as well as the leading foreign firms importing under the same license. The specifications include standard color, seating capacity, clutch, wheelbase, tire dimensions, number of brakes, cylinders, ignition, transmission, power and price. For the first time the horsepower rating adopted by the mechanical branch of the association last year is given in the handbook, a page being devoted to this, calling attention to the basis of the formula and how horsepower can be computed at a glance. Though the formula was produced to act as a commercial rating, there is no reason why it should not be employed equally well for contests of any nature. Eighty per cent. of the cars shown in the book have adopted this method of computation, and it is expected that in next year's handbook all the members will have adopted this formula as their standard.

An Aeronautical Textbook.—Herbert Chatley, in his textbook on "The Problem of Flight," published by the J. B. Lippincott Company, of Philadelphia and New York, has tackled the difficulties of aerial navigation from the standpoint of the engineer. There is little in the book that will appeal to the dabbler or the man interested in aeronautics as a possible field of sport. To the serious student, however undismayed by mathematical analysis, there is plenty of substantial food. Dirigible balloons of the lighter-than-air type receive but a small amount of attention compared with the consideration of aeroplanes and aviplanes, the author evidently rightly considering that it is in the realm of the heavier-than-air type that the real solution of the problem will eventually be found. It might be objected that too much space has been wasted on storage batteries and gasoline engines of a type little suited for aerial navigation, while practically no attention is paid to the several light-weight aerial motors successful in public tests. The volume is freely illustrated by line drawings and half-tone illustrations.

Touring Through Italy.—Art overrules all in Dan Fellows Platt's "Through Italy with Car and Camera," a handsome illustrated volume published by G. P. Putnam's Sons, New York and London. But as the author wisely remarks in his preface, a study of the world's finest art treasures being the main feature of every right-minded visit to Italy, no excuse is needed for the many references to pictures, statuary and architecture. There is much more of the artist than the automobilist about the volume, but even the most enthusiastic and sporty driver will not object to be free from the odor of gasoline in the persuasion of the volume. There are sufficient glimpses of scenes along the road to make the volume interesting as an account of travel by automobile, but for the person interested in the wealth of art of the country and desirous of seeing it in the most pleasing manner, no better volume could be recommended.

A German Automobile Handbook.—"Automobiltechnischer Kalender," a handbook of the automobile industry for 1908, is a compact, closely-printed volume of nearly seven hundred pages, from the publishing house of M. Krayn, Berlin. Completeness, amounting almost to elaborateness, is a feature of the Teutonic work, the machines described and parts analyzed in detail being, with very few exceptions, those of current models. The German industry is naturally the one occupying the major part of the publication, though French models are given some attention. Engineering tables are a strong feature of the book.

A Good Roads Suggestion of Great Promise. New York State has authorized the expenditure of \$101,000,000 for the building of a modern waterway, much of which simply enlarges the route of the famous Erie Canal.

By taking advantage of the bed of the canal a vast amount of preliminary work and its cost would be avoided, and as the route of the canal is naturally characterized by long, straight stretches and sweeping curves of large radius, the actual rise to be overcome being so small that when distributed over but a small portion of the available distance, the grade would be imperceptible.

Seller Now Sensibly Considers the Buyer's Rights. "When did we go out of the highway robbery line?" asked one of America's foremost automobile manufacturers of his superintendent, upon discovering, quite by accident, that the prices which were being charged for replacement parts of his cars would, if totaled, amount to fully three times the list price of the complete automobile.

Just why new parts to rebuild the same machine should cost several times more than the manufacturer found it possible to put the complete car out for with a good profit originally was one of the enigmas of the erstwhile automobile "game." Actually it was an outgrowth of the same pernicious practice that brought some manufacturers of bicycles into disrepute in earlier days.

The relation between buyer and seller does not end with the completion of the purchase, and subsequent courteous treatment does more to cement it and make of its recipient an assured future customer than all the blandishments the salesman can bring to bear.

Will the 1908 Models Be the Last "Annuals"? Though the futility of attempting to bring forth a new car with the passing of every twelvemonth, in order to meet the misguided demand of the comparatively few, was recognized some time prior to the holding of the recent shows, this seemed to be the first occasion on which any public reference was made to it.

The most successful cars on the market to-day are those that only differ from year to year in those small points, the betterment of which is the result of experience. While such cars are nominally new models, and are known to a large extent by the year of their production, their makers are always at pains to point out that successful precedents have not been swept away in favor of something new and untried, and that the car is merely an improved successor of its forerunners.

TAXICABS FOR THE MONUMENTAL CITY.

BALTIMORE, Jan. 20.—The taxicab, which has proven so popular in New York, London and Paris, will make its debut in this city on the first of April. The taxicabs will be introduced in this city by Howard Gill and A. Stanley Zell, of the Motor Car Company. The machines have been ordered from the E. R. Thomas Motor Company, of Buffalo, and are expected to be delivered in this city about the first of April, when they will be placed in service. Should they prove a success more will be ordered. Baltimore will be the second city in this country to put these cabs into service.

FREIGHT RATES DISCUSSED WITH RAILROADS.

Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, and James S. Marvin, traffic manager of the Association of Licensed Automobile Manufacturers, attended a conference last Tuesday, at Hot Springs, Va., at which freight rates for automobiles was discussed with the Western Classification Committee. Among other things considered was the minimum weight to be applied on carload shipments of automobiles, and also the minimum weights to be applied on less than carload shipments. The Western Classification Committee governs freight rates on all lines west of Chicago. The matter is an important one to the whole industry, any benefits which can be obtained being advantageous to manufacturer, agent and user alike.

DURYEA TRUSTEE UPHELD BY COURT.

READING, PA., Jan. 20.—When the matter of electing a trustee in bankruptcy for the defunct Duryea Power Company of this city came up, Referee Samuel E. Bertolet would not allow the claim of Herbert M. Sternbergh, president of the company, to be voted, on the ground that Mr. Sternbergh was not a creditor, but in reality owed the concern \$26,000 on his stock subscription. This prevented the election of the trustee favored by him, the Berks County Trust Company then having a majority of claims in both number and value, and the contention of the referee and the election held under it has just been confirmed by Judge McPherson, sitting in the United States District Court. The matter of adjusting the bankrupt's affairs has been held up in the meantime pending this decision, but the trust company will now proceed to settle matters without further delay. It is also stated that an action will be brought against H. M. Sternbergh to compel payment of the \$26,000 due on his stock subscription.

JERSEY'S SHOW TO BE NOTABLE AFFAIR.

NEWARK, N. J., Jan. 20.—New Jersey autoists are displaying lively interest in the preparations being made for the holding of the State's first automobile show at Newark during the week of February 21 to 29. The exhibit is to be held in Electric Park Auditorium, in South Orange avenue, this city, which is the largest exhibition hall in New Jersey outside of the National Guard armories.

The officials of the New Jersey Automobile and Motor Club are cooperating with those of the New Jersey Automobile Trade Association in the management of the show. The former organization has a membership of over 800, and is the strongest organization in New Jersey. The Trade Association is composed of dealers from all over the State, and is also a very strong body.

No money is being spared by the management to make the affair impressive and spectacular. More than \$2,000 will be spent in decorations alone, and several features have been announced, including a Governor's night, when four of the Chief Executives of the State, past and present, will probably attend, a club night when the Associated Automobile Clubs of New Jersey will attend in a body, and a "society night."

CREDITORS TRAIL "STOP THIEF" CRYER.

NEW HAVEN, CONN., Jan. 20.—John E. Fulton, president of a concern known as the Connecticut Automobile Company, which opened for business in this city about the first of the year, left town suddenly some time last night and the police with an army of creditors are hot on his trail. The concern, of which Fulton was the head, is surrounded by a great deal of mystery. It occupies one of the largest factories in this city, having over 80,000 square feet of floor space and was formerly occupied by the National Folding Box and Paper Company. Fulton announced that his company would put three styles of autos and commercial cars on the market to sell at \$350 each. He announced that the cars would cost less than \$250 to build, and would excel some machines selling at \$2,000. He advertised extensively, using full-page advertisements in the newspapers, which had as a catch line, "The Robbers Are On the Run."

It now develops that though some fifty men were employed, not one machine was built by this company nor were any orders taken. With Fulton was his son, a young man about twenty-five years of age, who was represented as being the inventor of certain machinery which enabled the company to turn out autos at the low price advertised. Fulton left creditors in this city who represent an aggregate of about \$5,000 in claims.

TO AMEND LIEN LAW TO COVER AUTOS.

ALBANY, N. Y., Jan. 20.—Assemblyman Weinert, of Buffalo, introduced to-night a bill to amend the lien law in order to make it cover automobiles in the hands of garage keepers and repairmen, for as things stand at present, where the car has been allowed to go out of his possession, no matter for how short a period, a lien cannot be enforced against it to collect for repairs or storage. The proposed new section reads as follows: "A person keeping a garage, or a place for the storage, maintenance, keeping or repair of motor vehicles, as defined by the Motor Vehicle Law, and who in connection therewith stores, maintains, keeps, or repairs any motor vehicle at the request, or with the consent of the owner, whether such owner be a conditional vendee, or a mortgagor remaining in possession, or otherwise, has a lien upon such motor vehicle for the sum due for the storing, maintaining, keeping or repairing of such motor vehicle, and may detain such motor vehicle at any time it may be lawfully in his possession until such sum is paid." It was referred to the Committee on General Laws.

ROADS TO BE BUILT AND BOOMED IN UTAH.

OGDEN, UTAH, Jan. 20.—The Utah Good Roads Association has completed its organization and arranged its plans in such a way that it will have to be reckoned with in politics at the next election. At an enthusiastic meeting held at the Weber Club a few days ago the articles of incorporation were formally adopted and a resolution was passed favoring the Brownslow good roads bill now before the Congress. Plans were discussed for the raising of a fund to build a State road across Davis, Salt Lake, and Box Elder counties. Local branches will be formed in these counties.

FATALITY FOLLOWS SKIDDING IN PROVIDENCE.

PROVIDENCE, R. I., Jan. 20.—While going slowly round a sharp curve near Oakland avenue, a big touring car owned and driven by R. Lincoln Lippitt, a member of the Racing Board of the A. A. A., skidded and struck a telegraph post. George H. Mercer, a cotton broker, who was riding in the car, was thrown to the street by the force of the compact, suffering a fracture of the skull from which he died three hours later in Rhode Island Hospital.

TESTS OF HEAT GENERATED BY TIRES.

Henry Souther, metallurgical expert of the Association of Licensed Automobile Manufacturers, has recently been employed on experiments to ascertain the comparative heating properties of different types of automobile tires. To get accurate measurement two thermometers were used and inserted by drilling holes through the wooden felloe and metal rim of the wheel, and using a steel case opening on the lower end, in which the thermometer was inserted. The case had a cap projecting through the felloe, allowing the thermometer to be placed in contact with the tube.

A road test was made on a run from the Engineers' Club to Long Island City and from there to Patchogue, L. I., over roads which at times allowed a speed of 48 to 52 miles an hour. A Dow non-deflation tube and an ordinary inner

HOW THE THERMOMETER WAS USED TO READ HEAT WITHIN TIRE.

tube were under test. Mr. Souther, reporting the result, says:

"The test conclusively proved that the Dow tube runs cooler than any ordinary inner tube, though just how much cooler this would be in hot weather I am not prepared to say. By my method of summarizing, in hot weather, with the temperature of 70 degrees Fahr., the increase would be for the regular inner tube 60 per cent., or 42 degrees Fahr., making a total temperature of 112 degrees Fahr., whereas from the results of my experiments I find an increase in the temperature of 45 per cent. in the non-deflation type, making it only 101 degrees Fahr. under the same conditions.

"In the non-deflation type there is more material than in the simple tube, caused by the double walls and the plastic material between them which prevent its deflation. Many believed that the Dow on this account would run hotter; I believe that view erroneous in view of the tests made."

NOTHING BUT OPTIMISM IN THE NORTHWEST.

MINNEAPOLIS, Mo., Jan. 20.—There is nothing of the "calamity howler" about President Chase, of the Chase Automobile Transfer & Livery Company, who has recently resigned as general manager of the Maxwell-Briscoe-Chase Company, of Chicago, and returned to this city. "I believe that the Northwest is the surest and safest place in the United States in which to do business," he declares. "While the East was suffering on account of the financial flurry in October, I ordered fifty automobiles for immediate shipment, and I wish that I had made it one hundred. I have delivered more automobiles thus far this month than I have any January since I have been in business, and if trade continues it may be the best month I ever had. I feel sure that this is going to be a banner year in the automobile business.

"I hope soon to surprise my friends with a new machine which will be built in Minneapolis. The engine, transmission and rear axle are now completed and being tried out, and inside of a year I hope to have a car made in Minneapolis that will be a credit to the city."

HOW A FRANKLIN AGENT SUPPLIED PROOF.

PHILADELPHIA, Jan. 20.—Nettled at the hard luck which attended his cars in the recent endurance run of the Quaker City Motor Club, President Percy L. Neel, of the Quaker City Automobile Company, took a decidedly risky chance last week when he sent a 28-horsepower Franklin over the 172-mile course for three successive days. The test started on Monday last, and was carried through to a successful conclusion under the same rules as governed the New Year's endurance test, which, however, called for a two days' schedule. Official observers representing various local dailies were in the car each day. The Franklin acted splendidly throughout and succeeded in finishing without a single road penalty. As a final test of the air-cooled principle of the Franklin, the car was placed in the steam-heated salesrooms immediately after the last day's trip, and the engine was run without stop until 6 o'clock the following night—a continuous run of 34 1-2 hours—without a semblance of "heating up."

THOMAS EXAMINED BY QUAKER COMMITTEE.

Editor THE AUTOMOBILE:

I note in the January 9 issue of your journal, where you give the results of the endurance run of the Quaker City Motor Club, that the 60-horsepower Thomas car in class B, driven by me, is marked as not examined by the technical committee. I want to say that this machine was examined by Charles Swain, a member of the technical committee, and was pronounced absolutely perfect. Mr. Swain is the president of the Quaker City Motor Club, and I do not understand how this information was given out as to the car not being examined.

We also note that you are giving another car the credit for being the first car to finish the run in Philadelphia, where, as a matter of fact, the Thomas was the first car to finish the run, being 32 minutes ahead of the schedule and 8 minutes ahead of any other car in the contest.

Reading, Pa.

E. S. YOUSE.

ANOTHER MUNICIPAL CAR FOR INDIANAPOLIS.

INDIANAPOLIS, IND., Jan. 20.—Another step toward equipping all of the various city departments with automobiles has been taken in the order placed for an automobile to be used by Chief C. E. Coots, of the fire department. After considering the matter for several weeks, the Board of Public Safety has ordered a 1908 model Marion runabout, the contract price being \$2,250. Chief Coots informed the board that he preferred a home-made gasoline car. Several months ago the board purchased a White steamer touring car and an Autocar runabout, and will receive a Rapid patrol wagon before the end of the month. The city engineering department has been provided with a Ford runabout.

CLUB ACTIVITIES BOTH WEST AND EAST

CALIFORNIA WOMEN AUTOISTS MEET TO LISTEN.

SAN FRANCISCO, Jan. 15.—The California Women's Automobile Club recently held its first meeting for the year. After months, in fact before the great fire, this club has been in existence in name only, it seemed almost impossible to get the members together, but those who had the welfare of the organization at heart never tired in their work, even when meeting after meeting was only attended by a few. These must have felt great satisfaction when the recent event was over. The clubrooms of the California Women's Automobile Club were crowded to the doors, many having to stand in the hallway. The occasion was the regular monthly meeting, and, as an innovation, the officers had sent word that a lecture would be given on the subject of ignition. For a couple of hours the women autoists listened to an expert, who covered the subject most fully. When adjournment was taken, several remarked of the pleasures of

APPEALS FOR FEDERAL REGISTRATION.

PHILADELPHIA, Jan. 20.—S. Boyer Davis, chairman of the legislative committee of the Pennsylvania Motor Federation, has addressed the following letter to Pennsylvania automobilists concerning the Federal registration measure, introduced in Congress by the Legislative Board of the A. A. A.:

FEDERAL REGISTRATION.

Every autolst who tours beyond the confines of his own State realizes the advantages he would derive from Federal registration, obviating the annoyance and expense of securing a license in any State except that wherein he resides.

Such a bill was prepared by the American Automobile Association and reintroduced during the present session of Congress and referred to the Committee on the Judiciary. If it is to become a law the autoists of the country must show that there is a strong demand for it.

We must do our part in Pennsylvania, and you are earnestly urged to write a personal letter to your member of Congress, requesting him not only to favor this bill himself, but to use his influence to

CALIFORNIA WOMAN'S AUTOMOBILE CLUB IN FRONT OF CLUB QUARTERS, SAN FRANCISCO, ON OCCASION OF FIRST GATHERING IN 1908.

the occasion and announced their intention of being present during the winter months, when these lectures are to be continued. During the first part of the meeting, Lady Beatrice Montagu, the president and founder of the Woman's Club of London, was elected an honorary member of the club. This is a compliment conferred on the British organization for the honor bestowed upon Mrs. Fred J. Linz, president of the local club, who was made an honorary member of the London club some time ago.

MARYLANDERS WILL ADMIT LADY MEMBERS.

BALTIMORE, Jan. 20.—Owing to the increasing number of fair devotees of the automobile, the Maryland Automobile Club found it expedient at its last meeting to take down the barrier and admit the gentle sex to membership. This decision was reached after some consideration relative to the consequences, and it was practically decided that in order to amplify the social features of the club the presence of the ladies would be necessary. The main reason for admitting them to membership was that women relatives of club members might join the club. In doing this the Maryland Automobile Club goes on record as one of the first in the country to make such a radical change. Though this is something that practically all of them will have to come to sooner or later, in view of the numbers of women autoists.

secure for it prompt and favorable consideration. Write not only yourself but induce others, motorists or not, to do so; especially men of influence and personal acquaintances of your congressman. We are particularly anxious to have such letters go to members of the Committee on the Judiciary. Do this at once.

In your letters please state that a bill providing for the Federal registration of motor vehicles has been introduced by the American Automobile Association, and call attention to the facts that the demanding of license fees in so many States from automobile users of interstate highways is not only an imposition financially and interferes with travel from one State to another, but results in much annoyance and often in the arrest and fining of many persons who through ignorance of the varying requirements have failed to comply with the laws of some State. That Federal registration in addition to that required in the State wherein the motorist may reside will relieve tourists of this great and unnecessary annoyance and place a reliable means of identification upon motor cars instead of the confusion incident to the requirements of some States. That as only a uniform method of registration and identification is sought in this law the right of States to regulate the use of motor vehicles is not encroached upon and that it will result in small trouble or expense to the Government and bring in a revenue far in excess of such expenditure.

S. BOYER DAVIS,
Philadelphia, Chairman Legislative Committee.

A. C. OF KANSAS CITY DINES AND TALKS ROADS.

KANSAS CITY, Mo., Jan. 20.—An elaborate banquet at the Midland Hotel—the second annual of the Automobile Club of Kansas City—did not prevent a lot of interesting discussion on good roads and other subjects of a kindred nature

dear to the heart of the automobilist. Ninety-four members of the club and guests did honor to the autofied fare and listened to the ten speeches of as many speechmakers. Curtis Hill, State Highway Commissioner, pointed out how a rock road system must be built up from the dirt roads of the State.

"The new State law providing for the establishment of benefit districts and the assessment of acre property along either side of the highway has been our greatest help. State highways will be built only by developing roads in the various counties and communities independently and connecting the links."

Numerous examples of how this was being done were given by Mr. Hill, and the plan outlined for the spending of the two and one-half to three million dollars a year now devoted by the State of Missouri to roads in a manner which would give proper supervision. A feature of the menu of the banquet was a map of the State showing the rock roads already constructed and those of a dirt nature in existence.

A. C. OF PHILADELPHIA BUSY SIGNBOARDING.

PHILADELPHIA, Jan. 20.—The roads and tours committee of the Automobile Club of Philadelphia, under the chairmanship of Powell Evans, is doing a splendid work in signboarding the various main routes leading out of this city in almost every direction. Although the Jersey roads are generally well equipped in the matter of road signs, the club's workers have found a few points where additional markers can be placed to advantage, and have arranged to supply the deficiencies. Northeastwardly toward New York via Trenton, about half the distance to the metropolis, has been posted. Northwardly the work has progressed far beyond Doylestown, and the Delaware Water Gap will be reached before midsummer. Northwestwardly to Reading and Harrisburg, the work is also well under way, while in a westwardly direction the roads to Gettysburg via Lancaster and York are being studied with a view to securing temporary alternative routes pending the improvement of several particularly bad stretches.

Another feature of the roads and tours committee's work is the laying out and posting of the best roads connecting the four principal routes, named at points in some instances as far as twenty-five miles from this city. Thus a well posted Trenton-Doylestown route would be a godsend to many an ignorant automobilist who, rather than take chances of losing his way, might prefer to come down to Philadelphia and thence to Doylestown over familiar roads. A Doylestown-Pottstown or a Doylestown-Norristown route distinctly laid out and signboarded would be an equal convenience, as would be a Pottstown-Downingtown route.

It is in line with the club's general scheme of road marking that the Automobile Club of Delaware County is being helped along in its good roads work in the hope of eventually securing a direct route to Baltimore. When this much-to-be-desired end gives promise of being attained, the club's signboarding work will be instituted along this route also, with a cross-county connecting route from Coatesville to Avondale or Oxford.

QUAKERITES TO HAVE NEW OFFICERS.

PHILADELPHIA, Jan. 20.—The annual meeting and election of the Quaker City Motor Club will be held Thursday, February 6, at the Hotel Majestic. While an entirely new set of officials will be elected, there will be but two contests—that for the office of secretary between the present occupant of that office, H. C. Harback, and Isaac K. Minford, and the usual fight for places on the board of directors. Following is the list of nominations: For president, P. Donald Folwell; for first vice-president, A. T. James; second vice-

president, L. D. Berger; treasurer, A. T. Stewart; for secretary, H. C. Harback and I. K. Minford; for board of directors (nine to be elected): G. Douglas Bartlett, E. C. Johnson, C. J. Swain, G. Hilton Gantert, E. H. Fitch, E. A. Maltby, E. C. Leeds (all present members), J. R. Overpeck, Evans R. Church, Frank Hardart, M. E. Brigham, Dr. W. J. Donnelly, F. C. Vanderhoff, B. F. Paist, L. E. French, Nicholas Petry, D. W. Webster and George M. Graham.

EARLY PLANNING FOR HARRISBURG'S RUN.

HARRISBURG, PA., Jan. 20.—Tentative plans and rules for the annual endurance run of the Motor Club of Harrisburg, which will be held on May 4 and 5, were made last week when R. H. Johnston, of New York, who will act as referee, held a long conference with the members of the contest committee. The route selected will cover eastern and central Pennsylvania, with the night stop in Philadelphia. Leaving this city on the first day the contestants will proceed via Lebanon, Reading, Kutztown, Allentown, Easton, Doylestown to Philadelphia, a distance of 167 miles. On the return trip the cars will pass through Norristown and on to Reading, across to Lancaster, Columbia, Marietta, Mt. Joy, and back to Harrisburg, a distance of 144 miles.

The rules for the contest will be far more strict than for any like run ever held in the East.

TOLEDO'S CLUB ONLY REQUIRES GOOD ROADS.

TOLEDO, O., Jan. 20.—The Toledo Automobile Club, which is just being organized, lays claim to being one of the most unique and original clubs of its character in the United States. Membership is not dependent upon owning an automobile wholly or in part, but the qualifications for membership are an interest in the good roads movement and a desire to help boom Toledo. In regard to the first, there is no section of Ohio which is better located for good roads than Lucas county, wherein Toledo is located, for substrata and surfacing materials are in plenty and nature's own gift, while in the second place it is the intention of the organization to work with the Toledo Chamber of Commerce for a larger and greater Toledo.

The club has just received notification of its affiliation with the American Automobile Association.

WEST VIRGINIA TO FORM STATE ASSOCIATION.

WHEELING, W. VA., Jan. 20.—The Ohio Valley Automobile Club has decided to devote its attention to the formation of a State organization of automobile owners in West Virginia to become affiliated with the American Automobile Association. At present the clubs have no central organization, while even many cities have no organized clubs. Indeed, the only two permanent organizations are at Wheeling and Martinsburg. As Parkersburg is the most central point in the State, it has been selected as the meeting place for the convention, the Chancellor Hotel to be headquarters for the present. Much attention will be paid by the State organization to the question of suitable legislation on the use and control of automobiles.

A. C. A. MEMBERS ATTEND INTERESTING TALK.

NEW YORK, Jan. 22.—After the regular club dinner at the West Fifty-fourth street home of the Automobile Club of America, last Tuesday evening, J. Dunbar Wright delivered an illustrated lecture on a "Trip Round the World" before a large number of members and guests. Many of the 200 lantern slides shown during the talk on travels had been taken by the lecturer himself during his journeys round the world, and the numerous incidents of personal adventure connected with them added greatly to the interest of the lecture.

THOMAS 1908 SIX-CYLINDER LIMOUSINE FURNISHES SMOOTH RUNNING, COMFORT, AND LUXURIOUS TRAVEL.

PIONEERING THROUGH FLORIDA.

THERE will be a chance for the sand and mud pluggers to prove their worth in the 366-mile run from Jacksonville to Miami, Fla., to be organized by the Florida East Coast Automobile Association the second week in March. Plans have been completed for James Laughlin, 3d, to leave Jacksonville on the morning of January 22 on a pathfinding trip over the land to be invaded. The 45-horsepower Cleveland car to be used on the trip will be fully equipped with pick-axe, spade, block and tackle, 18-foot pine skids, rolls of canvas and necessary camping outfit. Those accompanying Mr. Laughlin will be Vice-president George E. Sebring, of the Florida East Coast Automobile Association, and Sales Manager Charles G. Percival, of the Cleveland Motor Car Company. Their task will be to survey and lay out the 360 miles of swamp and everglades lying between the untraveled depths from Jacksonville to Miami, this district never having been completely covered by an automobile. Signboards will be erected at every point where their presence is likely to be valuable to the tourists.

The main body, expected to include a large proportion of the members of the Florida Association having their cars at Daytona, will spend five days in their trip down the

coast. Starting from Bay and Hogan streets in Jacksonville, Ormond will be the first objective point, a stop being made for lunch at the Alcazar in St. Augustine. An interesting portion of the journey will be that over the old King's highway out of St. Augustine, now being put into good condition by a gang of men under the personal supervision of Thomas White, father of Windsor White of Cleveland. Rockledge, 175 miles out, will be the stopping place at the end of the second day's run, half of the 71 miles being over very rough country with only a trail to show the way.

Fort Pierce, at the end of the third day, will have a rousing reception for the whole of the tourists and a silver cup to hand over to the driver of the car first striking the city. The trophy has been secured by the efforts of the *Fort Pierce News*; the reception will come from the entire town. Barren wastes, some creeks and possibly a little bridge building being the order of the going from Fort Pierce, it is considered that the 67 miles to West Palm Beach will be all the mileage that the contestants will be able to accomplish between sunrise and sunset. For a portion of this distance there are only rough trail made by wagons with a 60-inch tread. During the last stretch into Miami narrow limestone roads will be met, and comparatively easy going found, while the country is of the most beautiful nature.

MAJOR C. J. S. MILLER AND HIS AMERICAN LOCOMOTIVE CAR (LICENSE BERLIET), A MIGHTY HILL CLIMBER AROUND FRANKLIN, PA.

BAY STATE LEGISLATORS HAVE MANY AUTO BILLS

BOSTON, Jan. 20.—There is no rest for the legislative committees of the automobile clubs and associations in Massachusetts this winter, for during the next few months it looks as if they would have to pay close attention to the doings of the Legislature. The time for filing bills expired to-day, and about a dozen different measures have been entered, while others may be filed later by special permission. Every year since 1903, when the first automobile law was passed, the Great and General Court has amended and added to the existing statutes governing motor vehicles, and apparently the process is to be continued this winter and along varied lines.

The Safe Roads Automobile Association, which is composed largely of owners of cars, and the main object of which is to prevent improper use of cars and protect from reckless drivers of automobiles pedestrians and other users of the highways, has filed no less than eight bills, while from other sources have come other measures, including a petition from Nantucket that it be exempted from the application of the general law and that any rules which the Selectmen may make be final and not subject to appeal to the Highway Commission. This is intended to make valid an automobile exclusion rule which the town authorities have tried in vain to enforce.

All Vehicles Shall Carry Lights.

The measure requiring that all vehicles using the roads after dark shall carry a light or lights, which has been before the Legislature for several seasons and which annually has been turned down, has appeared again. There is an independent bill entered for this purpose and one of the Safe Roads Association's bills covers the same point. Another bill of the association intended to improve the rules of the roads provides that all vehicles must keep to the right whenever any other vehicle is in sight and whenever, as on corners, the view is obstructed for 100 yards in advance. This bill also provides that a vehicle must not pass another going in the same direction unless the driver of the vehicle wishing to pass has an unobstructed view ahead and can pass without interfering with a vehicle coming in the opposite direction.

Investigators of Accidents.

The most novel proposition before the Legislature is contained in one of the bills of the Safe Roads Association. It provides for the appointment of not more than four persons by the Highway Commission, who are to act as investigators and inspectors of accidents. They are to investigate every accident in which a motor vehicle is involved and which results in the death of any person, and such other accidents as

the Commission may deem necessary. This measure, if passed, will provide the Highway Commission with the same kind of machinery for investigating accidents as is now used by the Railroad Commission. It is also provided that the license of any operator concerned in an accident which results in a death shall be at once suspended and shall be revoked unless the Highway Commission, after an investigation and a hearing, decides that the accident occurred without serious fault on the part of the operator. A license so revoked cannot be renewed within six months, and thereafter except at the discretion of the Commission. It is claimed that this bill only applies to automobilists the same provisions of law which apply to other persons engaged in pursuits which the State or municipalities consider it necessary to license.

Suspend License for Reckless Operating.

Another proposed change in the law is that the Highway Commission shall suspend the license of any operator who is convicted in a court of operating recklessly or while under the influence of intoxicating liquor, and if the defendant appeals his case the suspension shall stand until he is acquitted, unless the Commission, after a hearing and investigation, decides to reissue the license. Other bills extend the fine and imprisonment clauses of the present law to cover the offense of running away after an accident and driving a car without register numbers in an attempt to conceal the identity of the car. The association has also presented a bill to require cars from outside States which are driven here for seven days in which they may be used without Massachusetts registration to display their home numbers substantially as required of Massachusetts cars. The association also asks for a codification of the automobile law, which has been so much changed and amended that it is now difficult to find all the pieces in the statute books.

Worcester Wants Its Hill Climb.

Another bill that is going in is that which the Worcester Automobile Club has been trying to have passed for several years, so that it may revive its annual hill climbing contest. This bill would permit local authorities to close highways for automobile contests. Last year it was claimed that the bill was too broad, in that it would permit road races such as the Vanderbilt Cup contest. This year the club will attempt to frame the measure so that it will be acceptable.

The Massachusetts State Automobile Association has as yet taken no action regarding these bills, but it is likely that its legislative committee will attend closely at the hearings and will also be represented by counsel.

WOULD MAKE AUTOISTS PAY FOR DAMAGE.

TRENTON, N. J., Jan. 20.—State Road Commissioner E. C. Hutchinson believes that automobiles do more damage to the roads than any other class of vehicle and would have them taxed accordingly. In his annual report to Governor Stokes the commissioner declares that the improved roads of the State have cost about \$5,000,000 and last year required the expenditure of \$592,014.75 for repairs, while the automobile revenue for this purpose amounted to only \$56,473.85. The road department has \$82,000 in automobile money for road repairs in 1908, but the commissioner feels that the amount should be increased by means of heavier license fees, so that the autoist could be made to pay for practically the entire maintenance of the State's improved roads.

OHIO INTENDS TO PUNISH "BORROWING."

COLUMBUS, O., Jan. 19.—The act of taking another's automobile without the owner's consent is to be punished in the future as a distinct offense, if the bill introduced in the Ohio Senate this week by Sylvester Lamb, of Toledo, becomes a law. Of late there has been considerable of this work throughout the State, and in most instances when the cars are recovered repairs are much needed. Malicious destruction of property was the best charge that could be made against the offender, but now he may draw a fine of not more than \$500 or less than \$100 or one year in jail or both, so that there is little doubt that once a few convictions have been obtained under the new law, the practice of "borrowing" automobiles would run up against an effective deterrent.

HARTFORD AUTO SHOW MET WITH PRONOUNCED FAVOR

HARTFORD, CONN., Jan. 18.—Not only did the exhibitors of the show of the Hartford Automobile Dealers' Association secure a return of their entrance fees for space, but they also obtained good big hunks of dividends which exceeded all expenses. Sales were substantial, enthusiasm was created, and the event gave the local dealers a generally optimistic attitude that was plainly apparent. Foot Guard Hall isn't the most commodious kind of a structure, but it was well decorated and met the requirements fairly well. To-night the breaking up came with a rush, and before New England's Sunday had gotten under way the exhibits had been removed from the hall and little remained to tell what had taken place.

Show Committeemen R. D. Britton, F. W. Dart, S. A. Miner and E. G. Biddle received much praise for their very successful conduct of the affair. It all means that there will be another similar event next year and perhaps in a larger building.

The exhibitors were generally pleased and so expressed themselves. Louis Elmer, who had the "center of the stage" with his array of Fords, never felt better in his life. Leonard Fisk talked Corbins from early until late, apparently with success. President Britton was the Maxwell advocate, and the representatives of the Capital City Company presented the Mitchell. Sales Manager Williams enlarged upon the merits of the Atlas product, and said that results were satisfactory. Robert Ashwell presented the air-cooled Franklin; the Miner Company had a taking trio in Pierce, Knox and Buick; the Palace Company showed the Thomas, Oldsmobile and Waverley, and, of course, the Packards were in evidence, exhibited by Brown, Thompson & Company. The Electric Vehicle Company intended to exhibit, but the receivers objected at the last moment. At the Isotta Fras-

chini-Simplex stand Harry D. Miller called attention to the body and equipment designed and made by the Bridgeport Vehicle Company. Although the customers of the Hartford Rubber Works Company showed its product, the concern itself was not directly represented.

The big social event of the week was the banquet, Thursday night, of the Automobile Club of Hartford, held at the Hotel Garde. President W. F. Fuller presided at the head table, at which sat Mayor Henney, Lieutenant-Governor Lake, Water Commissioner E. L. Smith, Hiram Percy Maxim and C. H. Gillette, while the out-of-town contingent included Frederick H. Elliott, Winthrop E. Scarritt and A. G. Batchelder. Since the banquet did not start until after the closing of the show for the evening, it meant that the festivities were not concluded until well after midnight. The speechmaking included much that was complimentary, referring to the wisdom of Connecticut in having the most progressive automobile law in the entire country.

In the course of his remarks, Lieutenant-Governor Lake, who is suspected of being in line for the chief executiveship, said:

"We told the legislature," he said, "that the automobile user recognizes that every man, woman and child has rights; the automobile users of Connecticut were put on honor, so to speak, and they have made good. The trap has disappeared, and good feeling toward the automobilist is increasing. The farmer is finding out that the automobile is his friend, not his enemy, and that its advent means better roads and more pleasure for all. To automobile clubs is due largely the desirable change of feeling toward the autoist. The automobilists may well regard with gratitude the State's automobile law, and rest secure in the confidence that the time for scolding the automobile user in Connecticut is of the past.

COMMERCIAL VEHICLE MAKERS COMPLETE AN ORGANIZATION

CHICAGO, Jan. 20.—The Commercial Motor Vehicle Manufacturers' Association has completed its organization, and will have its headquarters in Chicago. Its affairs are to be controlled by a board of managers consisting of the following:

H. G. Hamilton, Rapid Motor Vehicle Company, Pontiac, Mich.; Oscar Lear, Oscar Lear Automobile Company, Springfield, O.; J. E. Burke, Lambert Motor Truck Company, Anderson, Ind.; G. M. Weeks, Weeks Commercial Vehicle Company, Chicago, Ill.; H. C. Eddy, American Motor Truck

Company, Lockport, N. Y.; G. V. Rogers, Mitchell Motor Car Company, Racine, Wis.; Hayden Eames, Studebaker Automobile Company, Cleveland, O.

This board has appointed Walter Wardrop as the manager of the association, which, it is announced, "will in the future conduct all national shows, as well as public demonstrations of industrial motor vehicles."

The permanent officers of the association are as follows: President, G. M. Weeks; vice-president, Oscar Lear; treasurer, H. F. Hamilton; secretary, J. E. Burke.

THE LATEST AUTO BILL AT ALBANY.

ALBANY, N. Y., Jan. 21.—Owners of motor vehicles will be interested in a new bit of legislation which seeks to direct how the rays from their lamps shall shine. The bill introduced to-day by Senator Cordts of Ulster amends the motor vehicle law and provides that "each lamp upon a motor vehicle used for the purpose of a headlight or guidelight shall be equipped with shade or other suitable appliance working automatically which shall not interfere with the full rays of the lamp projected straight ahead, but shall adequately cut off all high rising rays from said lamp." The bill was referred to the Senate committee on internal affairs. It has the appearance of being a bill to boom some special shade device for auto lamps.

WHAT HON. ELIJAH HILL WANTS DONE.

COLUMBUS, O., Jan. 21.—Another automobile bill, the third in two weeks, was dropped in the legislative hopper to-day. It provides that any person operating an automobile with capacity for traveling at a greater speed than eight miles an hour shall be required to undergo an eye test to ascertain whether there be any defect in his vision that would prevent him from readily distinguishing the ordinary physical impediments and objects met with upon the public highway. The examination is to be non-technical, but practical in its purview. The bill creates a commission of vision at a salary of \$1,500 per annum, the governor to make the appointment. A fee of \$5 is charged for each certificate. The Hon. Elijah Hill of East Liverpool is author of the bill.

NEW YORK BRANCH OF THE EMPIRE AUTO TIRE CO.

EMPIRE TIRES OPEN NEW YORK HOME.

The juncture of Broadway, Amsterdam avenue and Seventy-third street, a point that is doubtless passed by more automobiles in the course of every hour of the twenty-four than any other single spot in New York City, has been selected by the Empire Automobile Tire Company, of Trenton, N. J., as the site of their New York establishment. The store itself, a view of which is depicted herewith, faces the Seventy-second street subway station and the intervening park, which makes its location particularly prominent. This branch is in charge of Marcus Allen, as manager, and has been fitted throughout in the most modern manner.

GASOLINE TRUCKS IN A NEW ROLE.

Evidence of the fact that the wide variety of commercial uses to which the gasoline truck may be put is daily being recognized to a greater extent is not wanting. One of the latest indications is the recent completion by the Knox Automobile Company, of Springfield, Mass., of an automobile dumping wagon to the order of the City of Cincinnati for use in collecting ashes. The appearance of this new car in the position for discharging its load is apparent in the accompanying photograph. The dumping mechanism consists of a clutch operating a slow screw which elevates the front of the body and is operated from the motor. This screw is provided with a trip at each end, which makes the operation safe and convenient. A similar device returns the body to its normal position.

This new truck is equipped with a two-cylinder, 16-20-horsepower motor and has a carrying capacity of 6,000 pounds, with a maximum speed of ten miles an hour. The body of the car is 10 feet long by 5 feet 6 inches wide and 22 inches deep. There seems to be little doubt that the successful introduction of this car will shortly lead to the use of others of similar type in other municipalities.

KNOX DUMPING ASH WAGON FOR THE CITY OF CINCINNATI.

CARNIVAL AND AUTO PROCESSION FOR GOTHAM.

Automobile New York will be en fete during the week of April 6, which means, if all plans mature, that the stores of Automobile Row will be in holiday garb, that the glad hand will be out everywhere, and that the spring selling season will be ushered in with right rejoicing.

Most important of the schemes decided upon at the meeting of the New York Automobile Trade Association, held at the Hotel Cumberland, was the resolution to hold an automobile parade on the Tuesday of carnival week. There will be four main divisions in the unique procession through New York streets, the first to consist of time-honored veterans which came into the world not later than 1903; the second class will be gasoline, steam and electric cars owned by dealers, neither cars nor owners to be decorated; class three will be all types of dealers' or private owners' cars, handsomely decorated, and finally the heavy brigade in the form of commercial vehicles.

Transportation, finance and advisory committees were appointed at the meeting. The finance committee consists of Richard Newton, chairman, Dayton Motor Car Company; Frank Eveland, Stevens-Duryea, and C. P. Skinner, Mitchell Motor Company. The transportation committee has as its members E. V. Stratton, chairman, Studebaker Automobile Company, and two others to be appointed by Mr. Stratton.

ONE OF THE NEW ATLAS TWO-CYCLE TAXICABS.

ATLAS TWO-CYCLE CABS FOR NEW YORK.

The Atlas Motor Car Company, of Springfield, Mass., are just completing some of their new two-cycle taxicabs, several of which have been ordered by the New York Transportation Company, which is now running a number of taxicabs of foreign manufacture on New York streets. These cabs are of the two-cylinder four-cycle type, and are made in France, so that the running of the new Atlas two-cycle, two cylinder taxicabs in the same service will form an excellent opportunity for making a comparison of their advantages for this rigorous commercial use. The new Atlas taxicab is rated at 22 horsepower, and its two-cycle, two-cylinder vertical motor has exactly five moving parts, all such small accessories as the camshaft, timing gears, springs, valves and the like having been eliminated, so that its design should fit it particularly for the use of drivers whose knowledge of mechanics is extremely limited. Transmission of the power is by means of a multiple disc clutch and shaft drive, the car being capable of speeds from 3 to 30 miles an hour with the aid of the engine control alone. The frame is of arch construction and the body of aluminum. Taken all in all, the new vehicle is well designed for the purpose in view, as may be judged, at least in part, from its external appearance, as depicted in the photograph.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

A local baseball star has just broken into the automobile business in Philadelphia. Captain Harry Davis, the crack first baseman of the local athletics, two times champions of the American League, has opened the Columbia Garage, at Twenty-third and Columbia avenue.

Business is booming in Omaha. In two days—two days of January, when automobile sales are not supposed to be brisk—the Rambler representatives handed over eight cars to new customers. A two-cylinder Rambler was paid for and taken away on Friday, and on Saturday the record business was done, seven cars going into users hands during business hours.

On March 1 the Winton company as a corporation will begin its twelfth year. After several years of preliminary work by Mr. Winton, the company was incorporated March 1, 1897, with capital stock of \$200,000, which in 1901 was increased to \$1,000,000. The officers elected at the first meeting of the new corporation are still holding the same positions—a remarkable record considering the mutability of the industry. Winton products have ranged from single to eight-cylinder cars, and the Winton company is the only one in the world whose plant is devoted to the exclusive production of sixes.

That there is money in the taxicab business is shown by a prospectus sent out by the E. R. Thomas Motor Company of Buffalo. The figures were secured by a representative of the company who spent some time in Paris recently and show a minimum earning capacity of \$11 per car per day. On the strength of this estimate a New York concern has placed an order for fifty taxicabs that are soon to be turned out by the Thomas company, while a company will soon be formed which is negotiating for double this number. Chicago has already ordered fifty, to be greatly increased as soon as the local demand has been determined.

"I believe this year we should have the best tour ever held by the American Automobile Association," said H. S. Leyman, of the De Luxe Motor Car Company, Detroit, Mich., and a member of the tours and racing committee of the American Motor Car Manufacturers' Association. "I do not believe, however, that the rules should be changed and would suggest a price classification. Under the regulations last year, a \$1,200 car was compelled to travel as fast as a \$6,000 car, which I believe is an unfair test. A classification under the following table or something of the same order, would work to advantage and be a fairer test than the tour of 1907. Cars selling under \$1,500, 15 miles per hour; from \$1,500 to \$3,000, 17 miles per hour; over 3,000, 19 miles per hour.

Public attention during the past five or six years has been so much centered on the development of the gasoline and steam automobiles, that the advancement in the electric automobile has not been as carefully noted as it would have been had they alone been in the field. This was shown at the recent shows when some visitors at the spaces where the Babcock Electrics were on exhibition, received with some skepticism the statement that the 1908 models made by that company could travel from 85 to 100 miles, and even more, on one charge of the battery. "I thought 40

or 50 miles was the greatest distance you could travel in an electric on one charge," was the almost general expression. When told that 40 or 50 miles used to be the limit, but that now electrics could travel twice that distance, some seemed genuinely surprised.

NEW AGENCIES ESTABLISHED.

The National Electrical Supply Company, 1330 New York avenue, Washington, D. C., is one of the latest additions to the long list of supply dealers handling the specialties of the Holley Brothers Company, Detroit, as agents.

Among the agencies recently added to the Northern Motor Car Company's long

THE RAINIER NEW YORK STORE.

It is fireproof construction throughout and can accommodate 180 cars.

list of representatives, is the Lincoln Auto Company, of Lincoln, Nebraska. This concern is one of the largest in its territory.

On February 1, the G. & T. Tire Company's agency in Philadelphia will move into their new quarters at 713 North Broad street, and will then have the largest tire establishment in the Quaker City. The building in on a corner across the street from their present location and is fully as large again as the latter.

The Cleveland branch of Morgan & Wright has been discontinued owing to arrangements which have been made with the Ohio Rubber Company, 2048 East Ninth street, for the exclusive sale of M. & W. automobile, vehicle and bicycle tires in Cleveland and vicinity.

Prescott Adamson, the Philadelphia agent for the Columbia cars, has just taken on the Renault, this being one of the numerous indications of General Manager Paul Lacroix's policy of opening branches in all the principal cities of the United States, in view of the great success that has attended the introduction of the Renault cars in the East. Mr. Adamson's

place is at the corner of Broad and Spring Garden streets.

The Mora Motor Car Company, of Newark, N. J., has just opened a New York branch at the southeast corner of Fifty-second street and Broadway in charge of W. W. Burke as manager. Mr. Burke held the same position with the Electric Vehicle Company for some time and is accordingly well known to the trade. The Mora made a name for itself in every one of the contests in which it was entered last year and it is thought that the new sizes now on exhibition will be even more successful.

The Allen-Swan Company, 1287-1291 Bedford avenue, Brooklyn, are now the agents for the Stearns cars in that city. Lew H. Allen is well-known in automobile circles at the other end of the Brooklyn Bridge, having been connected with the sales end of the Locomobile cars there for some time. He is president of the company and Halstead Swan is secretary and treasurer. A contract has also just been signed with Morgan B. Kent to represent the Stearns in the whole State of Massachusetts. Mr. Kent is a prominent Boston dealer, his place being located at 998 Boylston street. These are but two signs of the activity of Wyckoff, Church & Partridge, New York, since the consummation of the negotiations with the F. B. Stearns Company for the handling of their cars throughout the East. Agencies have also been opened in Rochester, Philadelphia and Baltimore.

PERSONAL TRADE MENTION.

Gaston R. Rheims, for some time past manager of the C. G. V. Import Company, has just severed his relations with that firm. No definite announcement of his plans is forthcoming at the moment.

P. R. McKenny, manager of the Brush-Detroit Motor Company which handles the Brush runabout in the Michigan automobile center, has just opened up his new store at 255 Jefferson avenue, Detroit.

Alexander Winton, president of the automobile company that bears his name and designer of the new Winton "Six-Teen-Six," has just been elected the new commodore of the Lakewood Yacht Club of Cleveland.

E. R. Thompson, well known to the trade as a newspaper man, has just been appointed the New York sales manager of the Hicks Speed Indicator Company of Brooklyn. His territory includes all of Greater New York.

Robert C. Hupp, who has been with the Ford Motor Company of Detroit, for some years past in the capacity of purchasing agent, has resigned to accept a position as factory manager with the Régal Motor Car Company. Mr. Hupp has been associated with the automobile business since its inception and is familiar with every branch of it.

Thomas D. Hanauer, for some time with the Smith & Mabley Manufacturing Company, when the latter firm was building the Simplex cars, and one of the charter members of the Society of Automobile Engineers, has just accepted a position as head instructor with the New York School of Automobile Engineers, 146 West Fifty-sixth street, New York City.

INFORMATION FOR AUTO USERS

Watts-Detroit Carbureter.—F. J. Watts is the designer of this new carbureter, and it is the result of considerable study of the problem of carburetion, as Mr. Watt has been connected with the automobile industry for several years, be-

PART SECTIONAL VIEW WATTS CARBURETER.

ing best known to the trade as the vice-president of the R. E. Hardy Company, New York, and the inventor of their "Sta-Rite" plug. One of Mr. Watts' chief aims in bringing out this new carbureter has been to overcome the annoyance caused by the more or less constant variation of the fuel level, due to jar and bouncing of the machine over rough roads. The Watts-Detroit carbureter represents an equally radical departure from current standards as did the Sta-Rite plug when first introduced. In the

PLAN VIEW OF COUNTERBALANCING DISK.

accompanying illustrations a sectional view and a plan view of the device are given. The part marked HH is a flat disk which is designed to exactly counterbalance the float DD, and also to act as a dash-pot to prevent chattering of the supply valve. This construction makes it impossible for any outside disturbance to affect the position of the

float, which is kept in a submerged position by means of two light springs of ample length. The initial air supply is drawn through the annular passage BB, and additional air comes through the large annular passage V, being passed through the latter and admitted in quantities to suit the requirements and speed of the motor, under the circular edge of the large auxiliary valve S. The opening of the latter varies according to the speed of the motor and the position of the throttle. The mixture is produced in a distinctly novel manner by rapid rotation of the contents of the mixing chamber, this movement being produced by a peculiar arrangement of fixed guides which confine the air within gradually narrowing channels, so that its speed is easily accelerated to the rate naturally due to the amount of suction, which can be remarkably light due to the unobstructed nature of its passage and the peculiar rotating effect. A suction of but one pound per square inch normally produces a flow at the rate of 332 feet per second, which is fast enough to rotate the contents of the mixing chamber at the rate of 500 revolutions per second. It is being manufactured and marketed by the Watts-Detroit Carbureter Company, 58 Griswold street, Detroit, Mich.

Stickney Safety Steam Generator.—This generator was designed by a well-known builder of light marine engines and fast launches and is now being marketed

THE STICKNEY STEAM GENERATOR.

by the Portland Garage Company, A. G. Frost, manager, of Portland, Me. It is said to give as high an efficiency and as dry steam as the flash boiler when working at its best, but is impossible to over superheat, and it also has the necessary reserve to climb any hill without recourse to the hand pump. It has the advantage over the fire tube type of producing superheated steam, and is not liable to injury by burning on account of lack of water. The central drum is of heavy plate, the heads being flanged and riveted, all material and work conforming to the United States Government standards. Surrounding the central drum and leading from its top is a down-flow superheating coil connecting with the engine. Three sizes are built, for runabouts, surries and small touring cars. The same concern also markets a patented

automobile turntable of strong and simple construction for garage use, besides several other steam specialties designed to improve earlier models of well-known steamers, which they make a specialty of refitting and birnring up to date.

Hoyt Testing Voltmeters.—Increasing knowledge of the necessity of watching the adjustment of coil vibrators and the state of the batteries on the modern car, if efficient ignition service is to be obtained, has created no little demand for special testing instruments for this purpose. As yet most of these are of the portable type, but owing to the frequency with which they are employed it seems fitting that they should form a part of the permanent equipment of the car. The Hoyt Electrical Instrument Works, Penacook, N. H., are now placing a special instrument of this kind on the market. As shown by the perspec-

HOYT VOLTMETER, TO MOUNT ON DASH.

tive illustration, there is an independent instrument for voltmeter and ammeter, for reasons that will appear, and the whole is adapted to be mounted on the dashboard. Its relation to the remainder of the ignition circuits is shown by a diagram illustrating the wiring necessary and which is supplied free by the makers. The two instruments are so interconnected on their supporting panel that the ammeter shows the actual amount of current being consumed by each coil, while the voltmeter indicates the voltage of the cells when supplying current; that is, under actual working conditions, which is the only way they should be tested. The small switch shown between the two instruments gives two points of control in addition to the neutral point, which is the extreme left. With the switch lever between the two, the ammeter alone is in circuit, while at the extreme right both instruments are connected with the ignition system of the car.

Triumph Grease.—After devoting considerable study to the requirements of automobile lubrication, the Perfection Grease Company, South Bend, Ind., have brought out a new grease under this title, for which many advantages are claimed. The new Triumph grease is spongy when made and remains in that form, it does not melt or run out of the bearings, nor does it get stiff so that it will not do its duty properly, no matter how cold the weather happens to be at the time. It is red grease, and, according to the makers, it is always red, and its unchanging character makes it a profitable investment, as it "stays on the job" and does not distribute grease spots all over the car.

THE AUTOMOBILE

Taxicabs Unaffected by Weather Condition

by W. F. Bradley

THE psychologist is better fitted than the mere automobile observer to explain why the teamster is most effusive when he is doing the least amount of effective work. When New York woke up last week to find that a vigorous baby blizzard had come in from the northwest during the night and taken possession of the city, it was the teamster body that chuckled most heartily, metaphorically patted itself on the back and went forth to plunge through a foot of snow, add confusion to confusion, but remain happy as a sand lark through it all.

Adverse weather conditions, whether from frost or snow, not only disorganize the horse traffic of the city, but are the direct cause of the horse traffic disorganizing every other means of surface transportation. Electric trolley cars soon had their right of way cleared for them by means of powerful plows and revolving brushes; automobiles fitted chains

and were able to run about any part of the city after the first snowstorm of the year with practically no diminution of their speed; but the horse was unequal to the occasion; it floundered in the snow; it slipped and skidded and fell where snow had given place to a glassy surface; it was mobilized for the removal of the snow, but was so unequal to the task that

often when a white load had been shipped the patient animals collapsed, or were unable to get under way without extraneous help. Meanwhile passengers in surface cars and cabs fumed as they were held up in blocked traffic for any time from five to twenty minutes, and cursed the snow which was the cause of the delay. The minority who found themselves encased in a double team crosstown horse car, which the city maintains as an exhibition of how we used to travel, put the blame where it properly belonged, but very few thought of charging the horse with traffic disorganization.

THOMAS TAXICAB DEMONSTRATING IN SNOWBOUND COLUMBUS CIRCLE IN COMPANY WITH A LARGE AUTOMOBILE FAMILY.

Yet the fact remains that New York, in common with hundreds of other cities, loses time and money through the inability of the horse to perform its accustomed duties whenever a snowstorm of any severity descends. The point to be noted is that not only the horse owners and users suffer inconvenience and loss, but that others, who would not otherwise be affected, have to bear the burden of the breakdowns. If conditions were reversed, and the newly arrived automobile obstructed traffic whenever weather conditions were unfavorable, the necessity for a more reliable service would be immediately grasped. Centuries of habit, however,

CHASSIS OF THE FOUR-CYLINDER THOMAS TAXICAB.

blind one's eyes to obvious defects. Instead of the conclusion that horse traffic is no longer adequate for modern city conditions, the oldest form of locomotion is quietly accepted as the inevitable.

In the earlier hours of the morning, before removal gangs had thoroughly warmed up to their task, some of the Fifth Avenue gasoline buses had trouble getting round corners where snow was particularly deep. But their inability to perform their task as regularly as usual was entirely due to neglect to fit chains or some other anti-skid device to the smooth, solid tires. Heavy three and five ton trucks, with full loads aboard, rumbled along as usual when their solid

tires had received some temporary bandage. Private automobiles found half the usual width of roadway rather narrow quarters in which to turn round, and long wheelbase cars needed to be skilfully handled in crowded crosstown streets; but they never refused to do their work.

The absurdity of the law against chains in certain sections of the city was never more forcibly apparent than during the period of the snowstorm. A few car owners, knowing that the police would be little in evidence in a snowbound park, ventured on forbidden ground, with wheels well equipped with chains and other devices of a similar nature, and had the satisfaction of proving that a considerable depth of snow is needed to stop a modern car. Flying through drifts at thirty-five miles an hour is an exhilarating experience.

Taxicabs Quick and Reliable When Conditions Are Bad.

But it was the taxicab which shone out most brilliantly when city traffic was in a state of anarchy, the little gasoline vehicles making light of a road surface that held up all horse vehicles, and working a route between piled up banks of snow, through which heavy teams and surface cars struggled for right of way, in a manner that was a revelation to traffic inspectors. First experience with wintry weather showed that there would never be any delay if all means of transportation were as reliable as the taxicab.

Though the diminutive power plants under the diminutive bonnets were only designed for economical use under normal city conditions, they met the strain put upon them in excellent style, not a single cab being stalled about the town or on the steep, snowy grades of Washington Heights, to which many a user directed them, with a certainty of being able to reach home quicker by this method than by any other.

Rather more gasoline than usual must have been consumed, for it was sometimes necessary to slip into the intermediate or drop down to the low gear on the snow-lad grades. One passenger has a story of how a short ride would have cost him dear if he had not departed in fright at the rapid rate the figures were adding up a total on the tell-tale indicator. The vehicle, which was without chains, was engaged for a run of about a dozen blocks. Before a dozen yards had been covered the cab was blocked in deep snow, the driver raced his motor, the wheels flew round, a shower of ten cents appeared in rapid succession on the indicator, and the vehicle stood still. Then the fare bolted rather than face that grand total. Though the case is an exceptional one, and would not have occurred if the wheels had been equipped with chains, it is worth asking, in view of the fact that some cities to which the cabs will be introduced have much more snow than New York, if the indicator should not always be driven from the front wheels, instead of the rear.

Drivers Found Business Brisk During Storm.

Taxicab business was particularly brisk during the height of the storm, every cab being snapped up as it entered its stand, and some would-be traveler always being in waiting for the arrival of a vehicle. One driver cooling his heels outside a private residence while his clockwork mechanism rolled up ten cents at regular intervals of six minutes declared enthusiastically:

"Gee, I guess we are doing business this weather! Why, I haven't had time to get a bite of lunch yet—it was there two o'clock—and the longest I have loafed this morning has been three minutes. You see," he added confidentially, "we are the only people who can get around with the streets in this condition, and everybody wants us.

"You bet that little engine can get through it all right. I was downtown yesterday in the early morning, when the snow was up to the axles, but she never stuck. I guess them leather bands can pull you through anywhere. They are

giving us a gallon of gasoline free every Monday morning, so that we shall have no excuse for freezing up. It isn't much if the weather is really cold, and you have to keep the engine turning over, but it is better than nothing."

Thomas chose the height of the snowstorm for demonstrating to Father Knickerbocker the new taxicab which he has designed at the Buffalo factory. E. C. Morse, manager of the E. R. Thomas Company, arrived with one cab, and during the stormy period of Friday and Saturday was skimming over the city with the heads of transportation companies interested in the latest form of rapid transit. It would have been impossible to have selected more strenuous conditions or a set of roads which more thoroughly tried the ability of the little town car, yet it responded in a thoroughly satisfactory manner. Manager Morse declares that he is negotiating with a number of large firms and fully expects to see a big series of Thomas taxicabs on the streets of New York within a few months. The first batch has just been sent to Chicago and has already been put into circulation. The interesting feature of the Thomas cab is that it is the first specially designed American-built taxicab.

UPPER BROADWAY REMAINED SNOWBOUND FOR SOME TIME, BUT AUTOMOBILE SERVICE NEVER SUFFERED.

which is being turned out in any quantities. "Deliveries can be made," said Mr. Morse, "in less than six weeks for moderate quantities, and larger quantities in two months. We have made arrangements at our factory for a large output and have a capacity of two thousand machines from now to the end of September."

Externally, the Thomas taxicab differs from those in use in this city by being finished in artistic but sober colors, giving the vehicle more the appearance of a private carriage than a public conveyance. In general lines it closely follows European standards, having been designed by an engineer closely connected with French practice. One of its most noticeable features is a four-cylinder engine in a single casting, the inlet and exhaust manifold and the water outlet manifold being cast integral with the four cylinders. Dimensions of the cylinders are 3 3/8 inches by 4 5/16 inches bore and stroke, giving a rating of 16-22 horsepower. The crankcase, water intake manifold, water-jacketed carburetor and gear cases form one manganese bronze casting, the entire power plant thus being composed of two castings only. An innovation is the absence of a center crankshaft bearing, the two end bearings, however, being of specially liberal dimensions. Ignition is by means of high-tension magneto, and water circulation is by thermo-siphon, with a honeycomb radiator set exactly over the front axle.

With a view to extreme simplicity, the transmission has been encased in the rear axle, the car thus consisting, in reality, of a simplified engine at one end and a rear axle and transmission at the other. Wheelbase of the cab is

103 inches, which, together with a very wide steering angle, makes it possible to turn round in a very restricted space.

How Patrons of One Hotel Insist on Taxicabs.

It has not required a very long acquaintance with taximeter cabs to prove to the public in what direction they can obtain the best and quickest transportation service, as is shown by an incident at the Waldorf Astoria. The patrons of that elegant hostelry are supplied with a horse cab service, furnished by an outside liveryman, but may have taxicabs by requesting the management to telephone to the company's headquarters for one. So many persons showed a preference for the mechanical form of transportation, with a clock to announce the amount of fare due, that the manager of the hotel was at last obliged to inform his liveryman that gasoline taxicabs must be installed instead of horse vehicles.

At the office of the assistant manager of the Waldorf Astoria, ignorance was professed of the entire story, but the information given that the hotel was always willing to send for a taxicab when visitors preferred this mode of

locomotion to the vehicles at the door. A notice to this effect indeed appears in the main hall. At the William H. Seach livery stables, from which the Waldorf cabs are supplied, everybody desired to be mute on the passing of the horse. As those particularly interested in the change have been spending considerable time recently in demonstrating taxicabs, the indications are that the story, if not correct in every detail, is at least right in its essentials.

BOSTON SOON TO HAVE TAXICABS.

BOSTON, Jan. 27.—A taxicab service is among the probabilities of the near future in this city and already there is one experimental cab on the streets, while a company has been organized to introduce a service here similar to the one in New York. The Boston Taxicab Company, which was incorporated recently in Massachusetts, is behind the plan, and it is understood that this company is a subsidiary of the New York Taxicab Company, which operates a large number of four-cylinder Darracq cabs in that city.

NOW AUTOCABS FOR QUAKERTOWN.

PHILADELPHIA, Jan. 27.—Secretary-Treasurer L. T. Layton, of the Philadelphia Taxicab Company, is authority for the statement that his concern will be ready within a month to inaugurate its business here with at least fifty vehicles.

The local company, which is capitalized at \$200,000, is composed of men prominent in the affairs of the city.

NINTH ANNUAL BANQUET OF THE AUTOMOBILE CLUB OF AMERICA, HELD JANUARY 25, IN ASSEMBLY HALL OF NEW CLUB HOUSE, FIFTY-FOURTH STREET, NEW YORK CITY.

A.C.A. BANQUET A GATHERING OF THE OLD GUARD

THE ninth annual banquet of the Automobile Club of America, held Saturday evening, January 25, in the palatial home of the pioneer autoing club of America, was remarkable for a goodly representation of the old guard of automobiling. As the A. C. A. was the first club formed in this country, it secured a membership which embraced not a few from other cities, and while many of these have become directors of local clubs, they elect to continue their membership in the big metropolitan organization. Since it was a gathering in vast degree of the early advocates of the motor-driven vehicle, it was not amiss that M. Jusserand, the French ambassador to this country, should be the guest of honor, it being a recognition of the debt which this and other countries owe to France for being greatly responsible for the coming of the automobile. While the pupil now considers that he is capable of instructing as well as the master, it is only fair to remember that the first chapters were learned from the lessons and experiments of the French makers, who, in the past, have certainly accomplished much to blaze the way for automobiling's progress.

President Colgate Hoyt, who presided at the head table with his accustomed dexterity, complimented the club members upon the condition of their organization. The new home on West Fifty-fourth street possesses ample garage accommodations and boasts of a dynamometer superior to any other ever installed. Commented the president:

"The property in which we are now housed will have cost not far from \$800,000. This money has been furnished as follows: By the club, \$170,000; by a first mortgage at 4-1-2 per cent. interest, \$350,000, which was secured, by the way, through the efforts of our treasurer, Mr. Fanshawe, without any commission being charged to the club; by a second 4 per cent. mortgage, furnished by the members at par, \$300,000; and although we have only been occupying this present house for eight months, through the wise handling of finances we have been able to draw from the bonds held by the members and pay off and cancel same, at par and interest, to the amount of \$40,000, leaving the total mortgage obligations of the club now \$610,000, against \$650,000 when we moved in."

Warmly welcomed was the French ambassador when he arose. In the course of his speech he said:

"One of the earliest dreams of mankind has been one of the last to be realized, and it has been realized only now under our very eyes—the conquest of space, the abolition of distance. To be able to flash your thought across continents and oceans is admirable; to have your voice carried through wires, and now without wires, is a wonder. But nothing can ever equal real presence, the actual transportation of your own person—thoughts, words, body and all—where you want to be. This the men before us could do only in their imagination. The Orientals had King Solomon's carpet, Ruggiero had his hippogriff, Rabelais had his movable roads, we have our automobiles, and we equal them all.

"When I think of the change this invention, while it is yet in its infancy, has worked in the world, I am proud to think that it is a French one. France is the mother of many men and many things. The genius of the race shows, luckily, no trace of age or of fatigue. It has never been more fruitful, having of late years given to the world the first dirigible balloons, the first submarine boats, that extraordinary metal, radium, and all that the discoveries of Pasteur mean for the alleviation of the sufferings of men. It has cut the Suez Canal; it has begun the Panama one.

"One of her sons, Dr. Laveran, has just received the Nobel prize for his discovery of the noxious action of mosquitoes in the spreading of fevers. And it has given the world the automobile."

Senator Chauncey M. Depew responded to the toast, "America, the User of the Automobile." His remarks included an excellent dissertation upon good roads, and he showed by statistics the increase in automobiling.

Augustus Thomas, the playwright, with "The Automobile and the Pedestrian" as his subject, supplied a budget of excellent humor, which was duplicated and even excelled by the scintillations of the Hon. Job E. Hedges, whose subject was simply announced as "Automobiles." Persistent calls

for Patrick Francis Murphy, one of the most accomplished after-dinner speakers, finally took him to the speaker's rostrum, from whence he proceeded to turn the tables on President Hoyt for having disregarded his promise not to call upon him for any remarks.

At the guest table, besides the orators of the occasion, were Dave Hennen Morris, during whose presidency the clubhouse project was successfully set in motion; Albert R. Shattuck, another ex-president, always active if not entirely effective in his methods; Dr. Schuyler Skaats Wheeler, the man responsible for the dynamometer; Col. John Jacob Astor, a persistent buyer of automobiles; the Hon. Jotham B. Allds, the New York senator who is shortly going to have something admirable to propose in the way of directing the good roads work in this State; Oliver A. Quayle, the indefatigable president of the New York State Automobile Association; Charles J. Edwards, the newly elected president of the Long Island Automobile Club; Gen. George Moore Smith, chairman of the club's show committee; Rev. Wilton Merle Smith, the club's chaplain, and Henry Sanderson, director of the club's garage department.

Scattered about the room were men who have been prominent in automobiling since its inception. At one table sat Alfred C. Bostwick, one of the early "daredevils" of the sport; not far away was the industrious Walter Christie, holder of the world's one-mile track record. A. L. Riker, winner of the first road race held in this country, was another ex-racing notable; Percy Owen, once a member of the American Gordon-Bennett team, was also present. Jefferson deMont Thompson, chairman of the A. A. A. Racing Board and Vanderbilt Cup Commission; A. R. Pardington, who once filled the same dual rôle, and Frank G. Webb, the vice-chairman of the 1908 Racing Board, were gathered at one table. Another in evidence was Robert Lee Morrell, also A. A. A. ex-chairman of Racing Board and Cup Commission.

Cortland Field Bishop, president of the Aero Club of America; Alan R. Hawley, and Augustus A. Post composed a prominent sky-pilot trio. Milo M. Belding, Jr., former chief counsel of the New York division of the L. A. W., and C. J. Obermeyer, once president of the L. A. W., were two cyclists who linked the past with the present.

Windsor T. White, S. T. Davis, Jr., S. D. Waldon, E. T. Birdsall and A. H. Whiting were observed in the old guard trade contingent, which also included W. D. Gash, E. B. Gallaher, Frank Eveland, Walter C. White, Peter Fogarty, Gaston Plantiff, C. R. Mabley, R. A. Greene, Charles E. Miller, C. R. Teaboldt, J. F. Plummer, E. R. Hollander, A. J. Picard, E. R. Partridge and H. R. Lounsbury, Jr.

Then there were Albert N. Chandler, president of the Automobile Club of Philadelphia; Frederick H. Elliott, secretary of the A. A. A.; Gage E. Tarbell, of life insurance fame; Col. L. C. Weir; Capt. Homer E. Hedge, who was one of the first movers in the organization of the A. C. A., as well as the Aero Club; William Pierson Hamilton, active in the club's show promoting; Robert Graves, owner of racing cars; H. M. Swetland; L. R. Smith; J. Dunbar Wright, the globe-traveler; Waldron Williams; T. Francis Moore, Briarcliff racing secretary; Louis and Andre Bustanoby; Orrel A. Parker; Charles H. Hyde; W. W. Niles; R. C. Newton; Lowell M. Palmer, Jr., and Arthur J. Moulton.

Two of the notable absentees were Winthrop E. Scarritt and George F. Chamberlain, both of whom have done much to aid in the progress of automobiling and who have also been especially active in A. C. A. matters. The metropolitan and trade press was well represented.

THROUGH KENTUCKY, DOWN INTO TENNESSEE

By PATHFINDER

IN continuation of our tour of exploration, told of in the January 23 issue of *THE AUTOMOBILE*, we have covered a trifle over 500 miles since leaving Columbus, O. Two-thirds of this mileage has been in Kentucky—a State which offers as much of interest to the tourist as any in which I have ever traveled.

Leaving Columbus we continued due west, and followed the National Highway to Springfield. This stretch of 45 miles offers unusual opportunities for speeding. Straight as an arrow, for the most part perfectly level, free from ruts, and not passing through any towns of size, the distance can readily be covered in an hour and a half, provided, of course, that there are any tourists who ever exceed the legal limit of 20 miles per hour. Three miles west of Springfield we turned off the National Highway, not with-

State, I should say here, we were favored by clear weather, although we felt the effects of the cold wave which has swept the northern States.

The first 25 miles out of Covington is over a toll road, and we paid a total of 81 cents on this stretch. We did not have to pay toll again in the State, although we saw thereafter many abandoned toll gates testifying to the fact that, until recently, toll was collected on most of the pikes. After leaving the toll road we reached a stretch where the road parallels the Queen & Crescent Railroad, and in 35 miles we took note of 28 railroad crossings, all over the same line. The turns across the track were often very abrupt, as were the turns over the bridges which span the tracks, and we found that great caution was necessary in approaching these crossings. The road from about 50 miles to 70 miles out of Covington leads through a hilly and rather lonesome country. The turns in the road are numerous and of extreme sharpness, and the same care was necessary as in the section above alluded to.

Horses and Mules Numerous.

As we neared Georgetown the road straightened out and widened out, but here a difficulty presented itself, which, in greater or less degree, has been with us ever since—namely, the trouble in passing horses and mules. It happened that County Court was being held that day in Georgetown, and this occasion is, by local custom, a time for general horse trading. Every one in the county who raises horses or mules—which is almost equivalent to saying the entire population—had come into town to buy or to sell. We met numerous combinations, such as the following: A man driving a team with

THIS LOOKS VERY MUCH LIKE A REAL OLD HOME IN KENTUCKY AND THAT'S WHERE IT IS.

out a feeling of regret, as we had traveled on this one road for about 320 miles. What a change was noticeable as soon as we turned off the Highway! Instead of a wide, straight highway, with few, if any turns, we had a narrow little lane, winding back and forth across the railroad. The surface was good, however, and we soon reached Dayton, 71 miles from Columbus. Here we looked into our water tank and saw that we had used but a gallon of water on the 71 miles—a striking demonstration of the efficiency of the condensing system in the White steamer of to-day.

From Dayton a fair pike leads to Cincinnati by way of Miamisburg, Bethany and Reading. There is little chance that one will go in the wrong direction in this vicinity. While still 20 miles from Cincinnati, we saw before us the cloud of soft coal smoke which hangs over the city, and by the time we reached our hotel we were covered with soot. Our odometer showed 125 miles for the trip from Columbus.

None of us had ever been in Kentucky, and we started out eagerly the next morning and crossed the toll bridge, which carried us over the Ohio river into Covington. From this town we had a gradual three-mile climb on a wide, slippery road, which, like much of the Kentucky roads, I fear would be rather bad in wet weather. While we were in the

one hand and with the other holding the halters of two or three newly purchased horses, which traveled behind his buggy. The horses were for the most part young and untrained, and the trouble in passing them may be imagined. We gave every assistance possible and most of the horsemen accepted the situation as a matter of course. There were one or two, however, who made sundry remarks regarding what they would do if they "had their gun." For traveling in Kentucky, sir, you will find it an advantage if your engine can be stopped when desired and easily restarted, and the more quietly you can start the more serene will be your progress.

There is a fine road from Georgetown to Lexington, and at the latter place, 88 miles from Cincinnati, we spent the night. Lexington is the center of the horse-raising section of the State. Good roads radiate from the city in every direction, connecting it with the great stock farms. The main street, just beyond the built-up section of the town, has been widened into a great speedway, where famous trotting horses are even more common than racing cars at Ormond and Briarcliff. Lexington was the home of Henry Clay, and we visited his old homestead outside of the city, as well as his monument in the cemetery.

Leaving Lexington, we had a splendid macadam road to Frankfort, 26 miles away, the capital of the State. Here we saw much of interest: the monument to Daniel Boone, the old State arsenal, the Capitol Hotel, where Goebel died, and the century-old State House, which impressed us even more than the magnificent new State House now nearing completion.

Bryan Orthodox on Roads Question.

It chanced that William J. Bryan, of Lincoln, Neb., was in Frankfort when we passed through. We talked with the famous orator and sounded him as to where he stands on the good roads question. We found that on this topic his views are entirely orthodox.

We had a very uneventful trip from Frankfort into Louisville, 80 miles from Lexington. This section of the State was settled very early, and we saw some fine examples of real colonial architecture. The last 15 miles into Louisville was over a fine, straight, perfect macadam road. We were very favorably impressed with Louisville, particularly with the wide well paved streets and the fine Hotel Seelbach. In the morning we drove through Cherokee Park and other parts of the city, so that it was noon before we headed southward.

The road was reasonably good for 40 miles, as far as Bardstown, one of the oldest settlements in Kentucky. I might say here that it was not until we had traveled more than 100 miles from Bardstown that we again saw a community that was anything more than a cross-roads hamlet. Beyond Bardstown, the country became wilder and the road gradually grew poorer. At Buffalo, 69 miles from Louisville, began a long stretch of very bad going. There was sand, mud, rock, water; in fact, everything except a smooth hard road. Eighty-five miles out from Louisville we crossed an iron bridge about 100 feet long, for which 40 cents toll was exacted.

We had realized all day that we would have to "rough it" that night and our expectations proved correct. We put up at a cross-roads, called Canmer, in a "hotel" which had three rooms for guests. We were served with sausages and raspberry jam for dinner and the same menu for breakfast. Our host sat down at the table with us, with his hat on, and asked us innumerable questions about ourselves. Incidentally, we obtained considerable information from him, including the fact that our road passed within 12 miles of the Mammoth Cave. We determined to take in this great natural curiosity, ranked as one of the "seven wonders of the world."

A Visit to the Famous Mammoth Cave.

The next morning, after 18 miles of bad going on the main north and south route, we came to Cave City. Here we left the main road and traveled over 12 miles of as bad road as I ever saw when we reached the cave. If it were not that we were told that the road is fairly good in summer, I could not conscientiously recommend this detour to any one. We were 3 1-2 hours in traveling the 30 miles between Canmer and the cave. Here we spent all told about three hours. The guide book says that there are 152 miles of avenues and grottoes in the cave. Visitors come from all over the world and spend days and weeks in exploring the place. As for our party, we all preferred traveling on the pikes, and we were satisfied to walk in for a mile or so and then turn around and walk right out again.

Then came 11 miles more of miserable road before we regained the main road at Glasgow Junction. From here we had an easy 24-mile drive to Bowling Green, where we spent the night. In this town the Confederate forces went through the formalities of installing a State government in the first year of the war, the members of which were promptly driven out by the Union sympathizers from other parts of the State.

ACQUAINTING HORSE AND AUTO—AND ALSO OTHERS.

"WHAT'S IN A NAME?"—WILLIAM SHAKESPEARE.

THE ROAD BETWEEN CAVE CITY AND MAMMOTH CAVE.

HENRY CLAY HOMESTEAD NEAR LEXINGTON.

LOOKE MONUMENT AT FRANKFORT.

ONE OF THE TYPICAL SOUTHERN MANSIONS.

From Bowling Green there is a direct and unmistakable pike right through to Nashville. Thirty miles from Bowling Green we crossed the line into Tennessee and left Kentucky behind us. Kentucky is a fine State; if poverty has any place there, it did not lurk near the roads where we traveled. Everywhere the land shows evidence of great fertility and the crops of tobacco and grain bring profitable prices. The houses in the country are substantial and comfortable, and there seems to be a fine saddle horse for every member of every family. Kentucky has many miles of fine road, and there has been no more gratifying feature of my trip than to see the evidences of projected road improvement work in almost every part of the State.

So far we have seen very little of the State of Tennessee—less than 40 miles. But as soon as we crossed the State line from Kentucky we noted a difference in conditions. The fields were not so carefully cultivated, there were broken-down rail fences instead of wire fences, and there were no bridges over the small streams. However, we had 15 miles of fine macadam into Nashville, and I will “suspend judgment” on Tennessee for the present.

A touring party, following the route which I have outlined above, would probably find it best to observe about this schedule: First day, Columbus to Cincinnati; second day, Cincinnati to Lexington; third day, Lexington to Louisville; fourth day (if early start is made), Louisville to Mammoth Cave; fifth day, Mammoth Cave to Nashville. While we spent two nights on the road between Louisville and Nashville, we had but a half day's traveling on the first day and the same amount on the third day. It is a reasonable assumption that the roads will be in better condition in the touring season than they are at present.

This is no country, however, for fragile machines or inexperienced drivers. There are no garages every five or ten miles as there are in New York and New England, and the touring party must be absolutely independent of outside aid. Finally, this is not a country for the scorchers—the roads are too rough for speed, and furthermore, the tourist must be prepared to stop his car and engine to allow horses and mules to pass by. To the trained tourist, who is looking for novelty, who is satisfied to cover an average of from 90 to 100 miles a day, who is considerate of the rights of other users of the highway, Kentucky extends the hand of welcome.

FOREIGN CARS COMING FOR NEW YORK-PARIS.

Foreign contestants have already commenced a journey which will not end, if all expectations are realized, until the automobile has put a girdle round the globe. Cable announcement from Paris is to the effect that the Brixia-Zust, one of the Italian contestants, has reached the French capital under its own power and will be shipped for New York next Saturday on the *Lorraine*. On its journey it was joined by the Motobloc, built at Bordeaux, and ran with that machine until the city boulevards were reached. Crowds in the streets became so dense that traffic was disorganized and the police were obliged to order the two automobiles to quit the stand they had taken opposite the *Matin* office.

There will be three cars on the *Lorraine*, due to arrive at New York on February 8, the number being made up of the Brixia-Zust, from Italy; a De Dion, and a Motobloc, from France. The only German participant, the Protos, will arrive one day later on the *Kaiserin Auguste Victoria*, having been shipped direct from Hamburg.

CANDIDATE W. J. BRYAN AND PATH-FINDER JOHNSTON.

A BRIDGE COMBINING NEW AND OLD TYPES.

SOME POINTERS FOR THE TROUBLE HUNTER

By CHARLES B. HAYWARD.

IN one or two instances, so-called authorities on the subject have been at pains to prepare a list of all the principal ailments that can afflict the automobile in one form or another. Seldom, if ever, has the compiler made any attempt to include *all* the things that can possibly happen to a car, and in view of the extreme rarity of many forms of ailments, the futility of even attempting to complete such a compilation must be manifest. Hence, only the principal defections of more or less common occurrence are usually included in such lists, though the impression made by their length is more than sufficient to suggest that a fine-tooth comb had been conscientiously employed in the process and that many an unknown disease has been brought to light for no other purpose than to show that it exists, and incidentally to swell the list. The feelings of the new owner of a car when he has an opportunity, for the first time, to survey such a list, are akin to those of the layman upon getting his initial glance at the interior of a medical work which gives him a faint idea of the truly wonderful variety of diseases that humanity is heir to. Whether gazing over a list of automobile ailments is apt to inspire thoughts of a nature akin to those of the average man who sees a remarkable coincidence between the symptoms described and his own, in almost every case, and thus make of the autoist a hypochondriac by proxy, is a question the answer to which inclines toward the latter view, for when hunting trouble that baffles discovery few clues are too slight to be followed and a long list is a most prolific source of inspiration.

If the beginner will observe the experienced trouble hunter round an automobile—particularly those who have achieved a reputation as wizards of their craft, he will not be forcibly impressed with any apparent following out of a well-defined system of searching for the cause of the ailment. On the contrary, it will appear as if the searcher jumped aimlessly from one thing to another, and frequently had scant idea of what to tackle next after his preliminary ministrations had failed of their anticipated effect. Of course, it is mighty disappointing when you have fully made up your mind that the carbureter is at fault and its malady is of a certain well-defined nature, such as a plugged-up jet, or a leaky float, for instance, to find that no such thing exists. "Well, then, it must be the ignition" may be the conclusion, and when a thorough examination reveals nothing wrong there, the amateur searcher all too frequently considers himself at the end of his resources.

System May Be a Valuable Aid.

Following out a set system of searching for trouble may constitute either an almost certain method of finding what is so eagerly sought, or quite the contrary, a means of wasting much valuable time and effort, with the sole final result of utterly disgusting the searcher with his task. Some of the lists referred to at the opening of this article would, if closely followed, be more than apt to have this result, from which it will be quite apparent that everything depends upon the system. It may seem that the average repairman in a garage goes aimlessly to work in looking for trouble round an engine, but a closer study of the methods employed in a large number of instances will reveal the fact that most of such men, where they have had considerable experience, have developed a system of their own. Practically every autoist does the same. In childhood, we learn most things that are beyond us purely by rote, and our only authority for the existence of a certain state of facts is the book. In the same way the new owner of a car looks to his "little book," but with

the knowledge gained from even a short experience such aids are discarded in favor of the teachings of the latter.

Probably there are few autoists to-day who, in the inception of their careers as such, did not place considerable store by the written word as expressed in the works of numerous authors on the maladies of the automobile, and who, before taking their first plunge, carefully primed themselves in advance with sufficient information to start a dozen balky engines. Strange to relate, though, it proved the hardest thing in the world to apply the knowledge thus gained to the matter in hand, and while everything seemed most beautifully clear as elucidated by the author with the aid of numerous illustrations and easy technical descriptions, the book might as well have been a work on the "infinitesimal interim" as on the automobile, so far as its help went in aiding the beginner when confronted with the reality. Not that it is desired to run down a book, or books in general, but merely to point out that their value is only appreciated to its full on a second or third reading in the light of experience gained during the intervals. It is difficult to appreciate anything that is not understood.

Make a Study of Cause and Effect.

Modern medicine does not direct its efforts half so much to the cure of the actual ailment as it does to the removal of the underlying cause, and the autoist who wishes to attain to that degree of knowledge where no defection of the motor, regardless of how puzzling it may appear, is sufficient to "stump" him, will do well to bear the fact in mind that there is always a direct and important relation between cause and effect in every stoppage of a gasoline motor. An engine that refuses to start from cold does not offer as good a subject for diagnosis, or the study of cause and effect as does one that has come to an apparently inexplicable stop while on the road. In other words, there is something to be learned from the manner in which the motor stops. A sudden and abrupt failure to fire may almost invariably be traced to the ignition system and just as forcibly points to a lack of current. But no battery "dies" suddenly, so that it stands to reason that a short-circuit or an open circuit, more often the latter and caused by the breaking of a wire or a connection, is responsible for the trouble.

Spasmodic and gradually weakening operation is most often due to a failing battery, or what is its practical equivalent so far as results are concerned, the gradual working out of adjustment of coil tremblers that have become loosened. This parallel is most often true of single and twin-cylinder engines, as the chances of all four tremblers of a four-unit coil getting out of adjustment in the same manner simultaneously is remote, but the resemblance between the two is so great that I have known more than one good set of dry cells to be thrown away for no other cause than that the poor adjustment of the tremblers caused every symptom of an exhausted battery to appear. A timer that has degenerated to a state where it only functions in an erratic manner, at times performing in a normal way for several minutes and then doing all sorts of "stunts," is also productive of symptoms that are frequently thought to emanate from the weakness of the source of current supply, or a gradually diminishing gasoline reserve. In connection with the latter there are most peculiar indications to record.

The last drop always tastes sweetest when there is no more to be had, and this seems to be the case with the gasoline motor as it runs so very well on the few last drops of fuel that a suspicion of impending disaster is furthest from the

mind of the driver. Just why a motor should stop suddenly when running at its best is naturally far more puzzling than where it gives up the ghost only after a more or less prolonged struggle against adverse conditions, and I have known more than one autoist to ardently wish that he could so adjust the carbureter of his motor to give results equal to those that it produces on the last remains of the fuel in the tank. But there is something different about the manner in which the motor stops from lack of fuel after giving this final spurt, and that of its sudden cessation of operation caused by a break in the ignition system—something that experience gives the ability to detect, as is true of so many other things.

Getting the Symptoms Confused.

It would be bad for the patient if doctors erred or disagreed in their diagnoses half as often as even the more experienced autoist does in his conclusion as to the cause of the malady, one instance that comes to mind at the moment being a case where the improper running of the motor was put down to the carbureter and every possible means of changing the adjustment of the latter having been resorted to without favorable result, its replacement was seriously considered. So firmly had the victim of the trouble become convinced that the carbureter and nothing else was at fault that it was only upon being shown by actual demonstration that the timer was responsible that he changed his opinion. As the car was of the light runabout type, selling at a low price, the device in question was not of a high order of efficiency, and experience with it on a number of the same cars had shown it to be afflicted with a chronic ailment inseparable from age and which was all too frequently put down to some other cause. This merely consisted of a weakening of the contact springs which so delayed the occurrence of the spark in the combustion chamber that the effect was the same as if the ignition had been retarded to an extreme.

In this connection it is well to remark before going any further, that the timer is very often responsible for the poor performance of the motor, or its stoppage, where the carbureter is blamed. The latter is a thing of mystery at times—even to the thoroughly initiated, and practically always to the beginner, so that it may seem more natural to suspect it than something simpler and more tangible, such as the timer invariably proves to be, for it must either work or fail while the carbureter has many intermediate stages of defection. In one instance that came to light a year or two ago the failure of this essential of the ignition system would have been responsible for the almost entire dismantling of the motor's accessories had it not been discovered in time—and time in this instance meant several hours of wearisome trying this, that and the other, a large part of which was lavished on the carbureter and its auxiliaries. It would be useless to attempt to detail the manner in which this long search was carried out or the endless number of expedients resorted to in trying to discover the trouble, which was finally found to consist of nothing more or less than a loose set screw.

The function of the latter was to hold to the timer on its vertical shaft, a recess in the latter being made for its reception. Owing to the vibration, or some other unexplained cause, the screw had backed out of this countersunk recess just sufficiently to hold at times and let go at others, with the added peculiarity that it always permitted itself to be picked up by the shaft when turning slowly, so that there was little or no difficulty in starting the motor by cranking, no matter how often it stopped. Its periods of continued running varied from one to two minutes to almost half an hour, being punctuated at times by sudden stops and equally sudden resummptions of action, caused by the timer being picked up again before the motor had lost its momentum, so that it automatically took up its cycle again. In the same way the ignition has been blamed for a miss that was finally

traced to a leaking inlet valve which had never been suspected.

As was the case in one of the instances already related, where study of the problem revealed the fact that half a dollar's worth of new timer springs were needed instead of the fifteen dollars' worth of new carbureter that the troubled owner had seriously considered investing in, a little reflection which takes into account all the phases of the matter will frequently not only lead to the discovery of the cause itself, but likewise result in a saving of considerable expense. Experience in giving "absent treatment" to a large number of cases, in other words, advising troubled owners at long range as to the cause of trouble with their cars, has shown that the average autoist is prone to overlook the fact entirely that the devices which are now apparently the cause of so much worry once gave satisfactory service and that for a long period. Failure to remedy the trouble by ordinary means seems to give rise to an insatiable desire to buy new parts or to go to other extremes of expenditure.

If the design or construction of the car were so radically wrong that nothing but a replacement or a redesigning of the part in question would suffice, which some of the owners in question seriously contemplate when confronted with defections of a nature apparently irremediable otherwise, how did the car ever come to give satisfactory service in the first place? Of course, it is a matter of common knowledge that most of the productions of earlier vintage embodied defects of design and construction of one form or another, and that it is possible to greatly improve such cars by redesigning some of their parts in accordance with what has come to be standard practice since they were first turned out.

A Little Reflection Will Help.

No one is in a position to know the history of a car so well as the man who has owned and driven it for two or three years, and it seems strange that in the light of the knowledge gained in this manner, that such owners should not reflect that what has given long-continued satisfactory service cannot be made to do so again by proper adjustment or repair. One of the things that is not taken at its full value is the effect of wear on moving parts. Take the wear on valve-operating mechanism as an example; it involves a dozen or more contacting surfaces, loss of metal from which tends to decrease the maximum valve lift and to hasten its closing, the only compensation for which is to be found in the lowering of the valve seat itself by grinding, so that after three or four years' use the valve timing is almost wholly deranged. Checking up the flywheel marking should reveal this.

Trouble has at times been traced to a combination of causes in which both the carbureter and the ignition system were contributors of the greatest importance, where failure of the motor to perform satisfactorily was concerned, and where completely remedying one did not prove effective for obvious reasons. But to go further into detail under the head of what might be termed complications, or, for that matter, any of the subdivisions which have been dwelt upon without any regard to a well-defined sequence, would require a volume.

In all motor trouble, and this comprises more than 75 per cent. of all the ills to which a car is subject to, barring tires, it should be borne in mind that a proper fuel mixture ignited at anything near the proper moment will give some evidence of its presence, and that where the motor will not produce so much as a "cough" under the most long drawn out and skillful ministrations, it has not "gone bad," nor is it "balky," or "hoodooed," or any of the other numerous bad things attributed to it by its puzzled owner. It simply means that one or the other, or both, of these cardinal necessities is not present in a form even remotely approaching that required for operation as the possible range of mixture composition and ignition timing under which a motor will show some signs of life is very great.

LETTERS INTERESTING AND INSTRUCTIVE

BALANCE OF FOUR AND TWO-CYCLE MOTORS.

Editor THE AUTOMOBILE:

[1,133].—Kindly give your explanation of combustion balance as applied to four and two-cycle motors. G. GRANT.
Bryn Mawr, Pa.

By combustion balance we presume you mean the balancing of the impulses of the motor, as distinguished from its purely mechanical balance, which has reference alone to the parts in motion. In comparing the two types of motors, it may be assumed that a four-cylinder motor is supposed in each case, as this gives the best balance attainable in the four-cycle motor, short of six cylinders. As you are doubtless aware, the pistons of the four-cylinder, four-cycle motor are placed in two groups of two each, the crank throws being arranged at an angle of 180 degrees, a typical arrangement being that in which two pistons in the same plane are placed at opposite ends of the shaft, while the other pair is between them. The impulse stroke of cylinder number one will then be balanced by the compression stroke of cylinder number three, which fires next and is balanced by the compression stroke of number two, the firing of the latter, which is next in order, being balanced by number four, and this in turn by number one, then repeating.

In the two-cycle motor of the same number of cylinders, there is no reason why they cannot fire one, two, three, four, thus permitting the use of a four-throw crankshaft with the cranks set at 90 degrees to one another round the crank-circle, and we believe this is the case in most four-cylinder, two-cycle engines. In other words, the motor of this type is practically the same as the single-acting steam engine, the only idle stroke being that of compression, the impulses thus being distributed much more evenly round the crank-circle than is the case with the four-cycle.

ENAMEL VERSUS PAINT ON A CAR.

Editor THE AUTOMOBILE:

[1,134].—There is so much trouble attached to the preservation and maintenance of the finish on the poorly-painted automobile and so much expense attached to the production of a really durable and high quality coach finish, that I have often wondered what objection there could be to the use of bicycle enamel on metal bodies at any rate. As all of us who had wheels will remember, these enamel finishes clung to the steel and presented a new appearance for an indefinite period under conditions of the hardest service. I always have understood that these enamels were applied simply by dipping and baking, without any precautions in the way of a multitude of coats or grinding down with pumice and rottenstone to produce a polish. So why are not enamels used on automobiles?

CLARENCE N. STUTTS.

Paducah, Ky.

We know of no reason why enamel should not be extensively used in the manner you mention, and, though without specific information that this is the case, we believe that several manufacturers employ enamel instead of paint. Its use undoubtedly is limited, however, by the considerable plant required for its proper application. Enamel cannot, as you suggest, be satisfactorily put on with a brush, but is best applied by dipping—a process that involves enormous tanks and large stocks of material for anything so large as an automobile body. And, besides the tanks, there are required ovens of similar magnitude, equipped with means for heating, and the maintenance of the temperature with only a minimum variation for many hours at a time. Undoubtedly enameling processes will come more and more into vogue as standardization progresses, unless there are objections to it with which we are not familiar. On this score, as well as on that of its present application, we shall be pleased to give space to anything that our friends in the trade may be interested enough to communicate to us.

EXHAUSTING ONE CYLINDER ON THE INTAKE.

Editor THE AUTOMOBILE:

[1,135].—Would you kindly inform me through "Letters Interesting and Instructive" as to whether I would gain anything by inclosing the pipe leading from the carburetor to the manifold through a sleeve and exhausting one cylinder through the sleeve, as per sketch. Have noticed slight popping noise at carburetor, especially at high speed. Carburetor is a Schebler and is new.

My spark plugs are wired through a single coil with a single wire running to the timer from the coil, thus causing both plugs to spark simultaneously. Would I improve matters by putting in a two-unit coil and a two-point timer?

J. L. DAVIS.

San Francisco, Cal.

We should hardly recommend such an arrangement as that illustrated by your sketch, which we are reproducing herewith. The amount of heat required for this purpose would not necessitate the direct use of the exhaust gases from even one cylinder. Instead of placing a sleeve such as you indicate round the intake, make one of a similar type to encircle the exhaust manifold and lead a somewhat large bore pipe from it to the vicinity of the carburetor, having it end in a bell-mouth so that it will discharge hot air on or against the carburetor itself. This may be found to prove an advantage, but such a very great number of cars run

PROPOSED HEATER FOR INTAKE MANIFOLD.

satisfactorily without any provision whatever for warming the carburetor, either by hot air or water, that unless good running cannot be obtained in any other way, it would seem hardly necessary to go to this trouble. The bonnet of the modern car is so tightly inclosed that the air under it is pretty warm at all times when the motor is running. The popping noise at the carburetor is usually caused by a weak mixture, which burns so slowly in the motor that it is still afire or under considerable pressure when the intake valve opens for the succeeding charge.

The ignition of the motor would doubtless be improved either by the retention of the single coil and the fitting of a combined two-point timer and distributor, or the use of a two-unit coil and two-point timer, although motors fitted as you state have often been run for a considerable period without great trouble.

WHAT IS THE CAUSE OF THIS KNOCK ?

Editor THE AUTOMOBILE:

[1,136].—I would greatly appreciate your help in finding the cause for a knock in my two-cycle automobile engine. When I start out it seems to pull quite well for a short time, but soon, on a slight grade, begins to knock if I advance the spark or not, and it seems to do best if I keep the throttle about 1-4 open and advance the spark some. I am pretty well satisfied that the bearings are snug and it seems to me like a premature explosion. The only thing I can think of is that there is something wrong with the cooling system. I have drained the water off several times and had one repairer go over the water circulation. How shall I clean it if you think that is the cause? I have had one cylinder off and did not find much carbon. I can feel that the engine has power until this

aggravating knock occurs. I cannot adjust my carbureter (a Schebler) so that the engine will run well with the throttle open and the spark retarded, especially when the car is standing still. Would a stoppage in the gasoline supply account for this? How can I tell if the flow is sufficient? If I open the cock under the carbureter while the engine is running wide open, should the gasoline still run out? The engine has automatic inlet valves.

Oakland, Cal.

A SUBSCRIBER.

If your statement that the bearings are snug could be regarded as true beyond a question, there might be some mystery in the knock you speak of, or as you say, it might be due to preignition, but from the remainder of your statement of facts there appears to be little doubt that it is caused by loose bearings—either in the wrist-pins or the connecting rod big-ends. The fact that the motor runs smoothly under no load, or a very light load, and immediately begins to make a knocking sound the moment a load is applied, is an almost certain indication of this, as a motor that is afflicted with a bad case of preignition will show the symptoms of its malady, even when running light.

It is far from desirable to run a motor with the throttle open and the spark retarded; the time of ignition should always be advanced as the fuel supply increases, otherwise there is not sufficient time for the proper utilization of all that is admitted and more or less back pressure is created, due to the fact that the charge is apt to continue burning after the exhaust valve is closed. If the motor will perform well at normal speed when hill climbing, that is, without missing, the gasoline supply is sufficient.

Failure of gasoline to run out of the cock at the bottom of the carbureter would merely be an indication that there was none in it, regardless of whether the engine was running or not, though if such were the case the engine would certainly not be running. The fact that the motor is equipped with automatic valves is somewhat at variance with your statement that it is a two-cycle, unless you refer to the ports or the check valves of the two-cycle type.

USING THE MOTOR FOR BRAKING.

Editor THE AUTOMOBILE:

[1.137.]—What is the best way of using a motor for a brake? This is a point, I am sure, which merits a good deal of discussion, for it undoubtedly is the fact that many otherwise competent drivers wear down the friction surfaces of the brakes, when a little knowledge of how to handle the motor in such a case would place at their disposal a ready means of retarding the car on long descents without burning up or overheating the brakes proper. The things I most particularly wish to know are: Is the greatest retarding effect secured with the throttle opened or closed? Should the ignition be switched off or not? And under what circumstances should the engine be driven by the car through the lower gears? With the throttle closed so little air is drawn in that the resulting vacuum must, by sucking the piston back on the next stroke, return a good deal of the power that had been absorbed. On the other hand, with the throttle wide open, full charges are inspired so a heavy retarding effect must be produced by the compression, but is not this nullified by the expansion in the succeeding stroke? These considerations make it difficult for me to figure out just what is best. I also would like to be told of some way to save the fuel while using the engine as a brake, for even though the ignition be cut out, the fuel must go through and be thrown away at a rate corresponding with the throttle opening.

ELMER WILLARD.

Dubuque, Ia.

Parts of your letter make it appear that you forget the cylinder of a four-cycle engine functions through a cycle of four operations just the same whether the ignition is off or on. Thus, with the throttle wide open, there is suction, compression, expansion, and exhaust, with the chief resistance in the compression stroke, and this resistance largely nullified by the immediately ensuing expansion which returns much of the power required for the compression. With the throttle nearly closed, there still are suction, expansion, and exhaust, with a resistance due to the production of a partial vacuum during both suction and expansion strokes, which is only partially nullified by the atmospheric pressure behind the piston during what would be the compression stroke had full charges been inspired. It follows, there-

fore, that an ordinary four-cycle motor gives a maximum braking effect when turned over against a closed throttle—a plan that further recommends itself through possessing the incidental virtue of saving fuel. Moreover, this being the case, it is not necessary to switch off the ignition, except to save current, provided, of course, that the fuel supply can be cut off completely. With a two-cycle motor, the conditions are different, and whether the throttle is closed or open, the suction in the one case and the compression in the other, tend to return the power that produced them, thus leaving only the friction, leakage, and heat losses, etc., to produce the desired retardation. The ideal way of using a motor for braking, though it probably would be objectionable practically, because of its complication, would be to have an extra valve mechanism that could be brought into action to the exclusion of the regular valve mechanism, and which would permit compression during each stroke and suction during each down stroke. As for the matter of gears, of course, by engaging a lower gear the car must turn the engine over faster than is required with a higher gear, in this way, opposing the greatest possible resistance to the car's motion. Very few cars will coast very fast no matter how steep the grade with the low gear in mesh and the clutch engaged and the engine dead. For cutting out the ignition, the usual method is simply to switch off the current at the regular switch. A rather more convenient way is to have a special cutout, placed so as to be conveniently operated by hand or foot.

TO GIVE BRASS AN ATTRACTIVE DULL FINISH.

Editor THE AUTOMOBILE:

[1.138.]—In a copy of "The Automobile," which I have lost, there was a formula to change brass to a blue or green metal finish. Will this wear and stay as you color the brass, or will you have to keep giving it a coat to retain that finish? Will you kindly put the formula in your next issue?

OMER M. SLOAT.

Worcester, N. Y.

To color brass a bluish black, make a solution composed of 15 parts nitric acid, 8 parts cupric sulphate, 20 parts alcohol and 12 parts water. Clean the metal thoroughly and remove every trace of grease, which may be done by dipping in a pickling solution composed of 10 parts sulphuric acid and 90 parts water, afterward rinsing clean in running water. Spread the above solution over the metal, then dry and rub with a clean rag, preferably linen. This is but one of a great number of such formulae for coloring metal, but it is doubtful if any of them give permanently satisfactory results. It is our impression that the latter are really only obtainable by electrolytic processes and that it would be more economical and certainly more satisfactory in the end to send lamps or similar parts to be given a dull finish to the electroplater.

STRANGE CASE OF UNEVEN WEAR OF GEARS.

Editor THE AUTOMOBILE:

[1.139.]—I am sending you under separate cover a gear that came out of the differential case of my Pope-Tribune Model 5. You will see this gear is badly worn on one end, while the other end is not worn away. The three gears that mesh into the left-hand axle are all worn like sample, while the other three are not worn any. The car has been run about 4,000 miles. Everything about the rear axle except these three gears is in good condition. What would cause these gears to wear in this manner?

J. R.

Claremont, N. H.

We are in receipt of the differential pinion to which you refer and must admit that the case is a puzzling one, without further information than the fact that the gears are worn as you state. We have inquired of the agents of the car in this city, but they do not recall ever having had a similar case. However, the cause of this one-sided wear can only be due to two things, acting either alone or in conjunction with one another. Either the load has been carried almost entirely on this side of the differential, or through some accident, the pinions in this side are of poorer material than those of the other, or, as already stated, both these causes may have been operative. The case is an interesting one,

and we should like to hear from any of our readers who have come across anything similar. The differential is the spur type commonly employed on low-priced American cars.

AUTOMOBILES FOR FREE RURAL DELIVERY.

Editor THE AUTOMOBILE:

[1,140.]—I am a subscriber and studious reader of your excellent journal, and would like to say a few words in your "Letters Interesting and Instructive." Why is it that there are not any machines designed and built for rural free deliveries use? I believe there would be a good demand for a good machine adapted for that special purpose. I have a plan for a machine of that sort, which has been pronounced by several as A 1, and would like to consult with some small manufacturers or some one contemplating automobile manufacturing. I have made this a special study for several months and sincerely believe this a good field for a good medium priced machine designed for that special purpose.

DELBERT DARE.

South Bend, Ind.

There is no doubt that the free rural delivery service of the U. S. Mail forms a most excellent field for a light and medium-priced car capable of standing up under hard and continued service, and while there are a number of machines on the market which may be considered as coming within this classification, there is still room for competitive effort, as no great numbers of any one make of machine have been adopted, either by individual carriers or by the Government. The postal officials of the latter in charge of this department, have, however, been doing considerable experimenting along these lines, and successful trials of small air-cooled machines have been made during the last year or two. These have led to the official adoption of several cars, but there is a tremendous field for automobiles of this type, not alone in the government service, but for the farmer and others living in the rural districts. You will find the announcements of quite a number of builders of small cars in our advertising columns, and we should recommend your getting in touch with them by correspondence in furtherance of your plans.

A MOST PECULIAR CASE OF TROUBLE.

Editor THE AUTOMOBILE:

[1,141.]—I have a two-cylinder 11-horsepower two-cycle engine in a 21-foot boat which makes about eighteen miles per hour. I used it all last summer, and at the end of the season I had some peculiar trouble with the spark plugs in the rear cylinder. As soon as I would advance the spark and speed up the engine the plug would get so hot that the metal point on the end of the mica center would melt off and the rest of the plug would blow out of the cylinder, while the cylinder would remain cool. This happened to four mica plugs. When I tried a porcelain plug the plug would get so hot that the cylinder would fire at the wrong time. I had this trouble with the rear cylinder only. Can you tell me where to look for the trouble? Thanking you in advance,

Utica, N. Y.

TWO-CYCLE.

We must admit that no case in any way similar to this has ever come to our attention before and we would not even venture to suggest an explanation any more out of the ordinary than that of a failure of the cooling water to circulate through the jacket of the cylinder in question. This would appear to be such a commonplace cause of the trouble and one so readily detected by anyone familiar with such motors that we presume it has been taken into consideration. We would, therefore, refer the query to the attention of our readers, confident that some one of them can doubtless give a better reason should the foregoing not have been the cause.

CONCERNING EXHAUST VALVE TIMING.

Editor THE AUTOMOBILE:

[1,142.]—Will you kindly give in your next issue of "The Automobile" the number of degrees the crank should have traveled when the exhaust valve should commence to open; also the position of crank when it is closed; what is the position in degrees when the intake opens and closes when mechanically operated? A. I. Q.

Swampscott, Mass.

We believe it is customary in American practice to have the exhaust valve open about 30 to 35 degrees on the crank-

circle in advance of the lower dead center, and have it close again either when the crank is exactly at the upper dead center or 3 to 5 degrees beyond it. The intake valve is set to open at the same time as the exhaust valve closes and remains open until the crank has passed the lower dead center some 15 to 20 degrees on the crankcircle. This is termed the lead given the valves, and its extent depends to a large measure upon the speed of the motor, its function being to insure the scavenging of the combustion chamber in the case of the exhaust and the aspiration of as full a charge as possible in the case of the intake.

THE POSITION OF AUTO HEADLIGHTS.

Editor THE AUTOMOBILE:

[1,143.]—Some years ago I read a suggestion to the effect that automobile searchlights could with advantage be carried as high on a car as practicable, even to the extent of placing them immediately beneath the forward end of canopy tops. The argument for this was that the higher the lamp the better the illumination is thrown into the small hollows and irregularities of the road. Since then I have seen a number of searchlights thus carried on canopy-top cars, besides the now common mounting on the dashboard. It has struck me that the same idea might be with advantage applied to the placing of the ordinary turn headlights, which, as usually mounted, throw their beams so low as to make every small inequality appear like a yawning pit, because of the intensely black shadow it casts. Has it never been attempted to mount these lamps higher—on the sides of the radiator, say—and does any one sell fixtures or brackets capable of being thus employed? And what merit do you think there is in the whole idea, and what, if any, are the objections to it?

ARNOLD WRIGLEY.

Chatanooga, Tenn.

While your suggestion is not, as you point out, altogether new, it certainly seems to merit the consideration of lamp makers, car builders and users generally. There is no question but that the very low position of many lamps largely discounts their practical value in the manner you mention, despite the provision of ample illuminating power. Some manufacturers, however, are evincing a tendency to mount the front lamps on very high brackets, and in at least one case—that of the Northern cars—the headlights are bracketed on the substantial front ends of the forward fenders, a placing that seems more desirable than your idea of brackets on the radiators. We shall be pleased to hear what, if anything, any one may have against these suggestions.

DIFFERENCE BETWEEN LIVE AND DEAD AXLES.

Editor THE AUTOMOBILE:

[1,144.]—What is a live axle and what is a dead one? Also difference between floating and live axle, if any? MPLS.

Minneapolis, Minn.

A live axle is one that is utilized to drive the car, in other words, a moving axle, while a dead axle remains inert. The former type is employed on shaft-driven cars on which the power is transmitted to the driving wheels through the live axle, while the second type, or dead axle, is a feature of double side-chain driven cars in which the axle does not move in connection with the driving of the car. There is no difference between a floating and a live axle, generally speaking. The former term is used because what are known as the driving shafts of a live axle, i. e., the two halves which extend from the differential to the two driving wheels are not firmly bound at either end. They are usually held by jaw or similar clutches at either end, so that they may be literally said to float, hence the term.

GAS IS WHAT PRODUCES THE HEAT.

Editor THE AUTOMOBILE:

[1,145.]—Will you please let me know through your columns which will heat a motor most, too much air through the carburetor or too much gas? F. S. P.

A slow-burning mixture, by which is meant one that contains either too little gas or too much gas, is apt to over-

heat the motor, but of the two the latter is naturally by far the worst, as it is the burning of the gas that produces the heat. As long as there is sufficient air to burn the gas, the more of the latter there is the more heat will be produced. But the overheating is not due so much to the fact that more heat is produced, as that, in the case of the slow-burning rich mixture, the heat is not utilized, a far larger percentage of it going to the cylinder walls and other parts of the motor. Probably the over-rich mixture does not produce as many heat units as the correct mixture would, but those of the latter are quickly utilized and the waste as quickly disposed of, from which it will be apparent that it is really the time element that is of the greatest importance.

INTERESTED IN DAIMLER DRIVER'S CERTIFICATE

Editor THE AUTOMOBILE:

[1,146.]—Will you kindly inform me through the columns of your journal if you know of a chauffeur's certificate given by the Daimler Company to men who pass an examination under their supervision? If so, kindly state where information can be obtained in regard to the conditions.
H. HUBBERSTEY.
New York.

We are not aware of any chauffeur's certificate granted by the German Daimler firm. The British Daimler Company has recently inaugurated a scholarship scheme the candidate chosen after examination being entitled to two years practical and theoretical training in their works and payment of \$500 per annum. At the completion of the two years' term the holder of the scholarship may be retained in the company's works at a salary of not less than \$750 per annum. There are also four minor scholarships granting the same facilities, but fixing payment at \$100 per annum. A number of European firms train mechanic apprentices, but training of drivers is now rarely undertaken by the factories.

WILL MR. DURYEA PLEASE OBLIGE?

Editor THE AUTOMOBILE:

[1,147.]—I want some information about the first public competition in a race of cars in the United States. I believe it was held in Chicago and that a Duryea won. I am not positive, however, and if you could tell me how many cars participated, how long the course was, and the time, I would be very much pleased. Your paper is fine and I couldn't get along without it.
Milton, Pa. MYRON L. DICKSON.

As Charles E. Duryea, of Reading, Pa., now consulting engineer of the American Motor Car Manufacturers' Association, was the winner of the race in question in a car of his own design and build, we should prefer to have him give the facts, which we have no doubt he will supply us with for publication in a forthcoming issue.

TO SOFTEN AND PRESERVE LEATHER.

Editor THE AUTOMOBILE:

[1,148.]—Will you kindly give me a receipt for softening and preserving leather, color dark red.
G. R. FERNALD.
Wilton, Me.

Wash the leather with a little soft soap and warm water, wiping it thoroughly dry. Then prepare a dressing composed of lard, 100 parts; castor oil, 20 parts; yellow wax, 25 parts, and white vaseline, 30 parts. The latter is given in a general collection of such formulæ, and we cannot guarantee its efficacy. Any reader who knows of a better one with which he has personal experience in applying to the upholstery of his car, may give it in these columns, if he wishes to do so.

INFORMATION WANTED CONCERNING DRY CELLS.

Editor THE AUTOMOBILE:

[1,149.]—Among your letters note particularly No. 1,090, regarding dry cells. I second the latter part concerning reprinting Mr. Jackson's letter, being a new subscriber who has had much trouble

with ignition; cannot use anything but dry cells, as I have no facilities for recharging storage batteries.
A. R. JACOBS.

Dillon, Mont.

Mr. Jackson's article concerning the use of the dry cell appeared in the issue of THE AUTOMOBILE of May 23, 1908, of which copy will be forwarded upon request.

FOR MR. MUNCH HAUSEN TO DIGEST.

Editor THE AUTOMOBILE:

[1,150.]—Possibly the solution of my experience in the matter of consumption of cylinder oil may be of interest to the writer of letter No. 1,109, published in your issue of January 16. During the past two years I have driven a Rambler Type 2 machine (double-opposed cylinder, 5-inch bore, 6-inch stroke) 3,744 miles with a total consumption (crankcase and cylinders) of seven gallons of cylinder oil—an average consumption of one gallon of oil for each 535-mile run, using round numbers. The engine is now and has always been in perfect condition.
C. J. W.
East Acton, Mass.

Editor THE AUTOMOBILE:

[1,151.]—In your issue of January 16, M. H., of New York, doubts the statement of J. G. C., of East Orange, as to his averaging \$81.09 miles on one gallon of oil. Although that is a fine average on that quantity of oil, it is a well-known fact that a great many cars of 20 horsepower are doing at least 100 miles on two quarts of oil all the year round. And I personally know of a certain make of car of 14 horsepower that uses only one quart for 100 miles, so I think that J. G. C. has made no error in his statement.
W. A. FOSDICK.
Dallas, Tex.

AGREES WITH DIAGNOSIS OF VIBRATION.

Editor THE AUTOMOBILE:

[1,152.]—In your column "Letters Interesting and Instructive," in letter No. 1,097, on "A Problem in Vibration," you say, if your idea is right, on a hack-handed motor the vibration should be greater. I will say that I have noticed the same thing on the cars that I drive. Am at present working on four or five Stearns and a couple of Oldsmobiles. The Stearns are back-handed motors and the vibrations are always greater on the left-hand side than the other, while the Oldsmobiles, being the opposite, the vibration is on the right. The Stearns are chain driven and the Oldsmobile shaft driven. I have often noticed the fact of the greater vibration, but until I saw this article I never gave it much thought.
Montello, Mass. JAMES E. FAUNCE.

HERE'S A CHANCE FOR THE A. A. A. LAW BOARD.

Editor THE AUTOMOBILE:

[1,153.]—I have just received a copy of the rules and regulations of the National Park in Wyoming, and I note that automobiles are absolutely prohibited from passing through the park. I am informed that the grades are fine, good and wide, and that there is no earthly excuse for excluding automobiles. The season opens about July 1, and, if enough influence is brought to bear with the Secretary of the Interior, these rules can be rescinded.

If your journal wants to receive the everlasting gratitude of a large number of autoists, this is a chance to get it.

Yosemite is open.

Spokane, Wash.

C. P. THOMAS, M.D.

A FOUR-WHEEL DRIVE WITHOUT AXLES.

Editor THE AUTOMOBILE:

[1,154.]—I have noticed letters in "The Automobile" regarding a four-wheel drive, and am accordingly giving you a description of a car of this kind that I am now building. The car is built without axles, the wheels running in independent frames, making a more simple and durable form of construction. All four wheels are driven, the front truck turning to steer the vehicle. I am now using a 24-horsepower motor on the rear truck with a chain drive, but a gear drive is equally applicable. No differential is employed.
Reno, Nev. P. A. HELCHER.

FOR "INTERESTED READER, DETROIT, MICH."

If the correspondent who has contributed a letter to this department regarding the controversy between the advocates of the four and six-cylinder motors, signing it as given above, will make known his name and address, the letter will be printed in the usual course. This information is not wanted for publication, but merely as evidence of good faith. Names and addresses will never be published where a request is made to that effect, but no communications should be sent anonymously.

THE success of the Stevens-Duryea cars may well be termed the reward of consistent adherence to a well-outlined policy adopted as the result of confidence in a particular type of car, as the builders, the Stevens-Duryea Company, Chicopee Falls, Mass., were one of the first manufacturers to market six-cylinder cars in this country. Realizing from the outset, however, that what was needed was not merely a fifty per cent. enlargement of the four-cylinder motor as it then stood—in other words, not a motor half again as powerful, but one of the same power with the advantages of the greater number of cylinders, the Stevens-Duryea engines are not merely replicas of their four-cylinder type, but have been designed particularly with a view to meeting all the conditions imposed by the new order of things. Two models are listed—the “Light Six” and the “Big Six,” as they have come to be known familiarly, their official titles being Model U, which is the 35-horsepower car, and Model S, the 50-horsepower type.

In addition to having been close adherents of the six-cylinder type of car from the earliest days of the multi-cylinder engine in this country, these builders have likewise devoted a great deal of attention to evolving a power plant that is distinctive in a great many features, so that it is natural that the engine in both the small car and its more powerful brother should be distinguished by the same characteristics. The chief of these is the unit form of construction and upon the value of this in the successful building of a six-cylinder automobile motor the builders of the Stevens-Duryea cars lay great stress. They were the pioneers in this field to adopt a three-point form of suspension for the motor, clutch and change-speed gear, which may be thus combined in one rigid unit, so that no amount of torsional strain of the car’s frame or other parts can be transmitted to the power plant, this being but one of the numerous inventions of J. F. Duryea. The great value of such a support in the case of the six-cylinder car is that it insures absolute permanency of alignment to the extra long crankshaft where most needed.

As already mentioned, the description of either of the Stevens-Duryea motors will apply in large measure to the other. The cylinder castings are made separately and the valves are all placed on the same side so as to be operated from a common camshaft, the

valves themselves being made interchangeable. The connecting rod and main bearings in the Model U, or “Light Six,” are babbitt bushings, while the main bearings of the 50-horsepower car are of the annular ball bearing type, thus requiring but a minimum of attention. The flywheel is placed at the forward end of the motor in each case, this being one of the most distinctive features of the Stevens-Duryea design, while the crankcase supporting arms, of which but two are employed, are placed at a point less than a third of the length of the crankcase from the forward end and are cast integral with it. Throughout the design it has been the aim of the builder to minimize the number of small parts. This will be apparent in the use of a single camshaft, while a second shaft driven through spiral gears from the camshaft takes care of all the motor accessories, operating the large centrifugal pump, the ignition timer and the oiler, the last-named being run through the medium of a flexible shaft extension.

The crankshaft is a one-piece forging ground on the journals to an accurate fit, the clutch member and flywheel fastenings being of the taper and key type, locking with a nut instead of the more usual form of flange construction. A commendable feature is to be found in the careful marking of the flywheel rim to indicate the valve timing, so that the latter may always be accurately readjusted after taking

THE STEVENS-DURYEA MODEL U, OR “LIGHT SIX,” LIMOUSINE IN COMPLETE RUNNING ORDER.

THE MODEL R, 20-HORSEPOWER, FOUR-CYLINDER TOURING CAR

the motor down. In the smaller model provision is made for the withdrawal of the camshaft through a hole in the flywheel, while in the larger car it is necessary to dismount the flywheel itself before this can be done. The timing gears are marked at their meshing point to insure accurate replacement of the camshaft. The manifolds have been made as simple as it is possible to do so on a motor of this number of cylinders, this having been attained in large measure, where the exhaust is concerned, by dividing it into two independent parts. The carbureter employed is of an exclusive design, and in the case of the Model S, or 50-horsepower car, is provided with a double jet, and there is special provision made for supplying it with warm air from the motor in addition. A float-feed is used in both cases. A six-feed mechanical oiler with an individual pump for each lead is conveniently located on the dash and takes care of the essential of lubrication. Ignition is of the high-tension type, while a cellular radiator supplied by the large pump shown is employed for cooling.

Although bolted together in one rigid unit by means of a cylindrical casing of aluminum alloy, none of the parts of the motor, clutch or gear set are any the less accessible on that account, as will be quite evident from the view showing the manner of removing the multiple disc clutch merely by the lifting off of the sectional portion of the housing which incloses it. In the Model U this clutch consists of a series of cork-faced brass discs alternating with a series of steel discs, the driving member connected with the engine shaft carrying the first set and the driven member the second. The two sets of discs are forced together by a powerful self-contained spring carried in the driving member. Adjustments for wear are easily made by means of a series of milled grooves, an adjusting pin and nut and six holes in the milled grooves of the driving member, which combine to make adjustment practically automatic, as the nut can only be locked at certain points. The clutch may also be dismounted bodily with but little trouble.

INLET SIDE OF THE MODEL U SIX-CYLINDER MOTOR.

THE THREE-SPEED GEAR SET SUPPORTED ON BALL-BEARINGS.

The gear set is of the standard sliding type and provides three forward speeds and the usual reverse, being the same on both cars. A patented self-finding device is employed on the shifting lever. Compactness of arrangement and a saving in weight and necessity for adjustment are gained by the use of annular ball bearings on the "Big Six." The final step in the transmission of the power is by means of a propeller shaft and live axle. Two sets of brakes are employed, the external contracting pair, or running brake, being

HOW THE MULTIPLE-DISC CLUTCH MAY BE DISMOUNTED.

pedal-operated in the usual manner, while the emergency brake is composed of the internal expanding members, which are operated by the hand lever.

Some of the other specifications of the small car are an I-beam forged front axle, chrome nickel-steel frame, 40 and 48-inch semi-elliptic springs, 114-inch wheelbase and 34 by 4-inch tire equipment on all four wheels. In the case of the 50-horsepower car, the wheelbase is 122 inches and the tire equipment consists of 36 by 4-inch front and 36 by 5-inch tires on the rear. Hess-Bright ball bearings are used throughout in this car. The Model R, four-cylinder, 20-horsepower touring car is also continued.

DETAILS OF THE CENTRIFUGAL CIRCULATING PUMP.

STUDEBAKER LIMOUSINE, MODEL H, 30-HORSEPOWER.

“FROM the viewpoint of the engineer, the gasoline automobile of the present day does not differ radically from a type that was accepted as standard almost three years ago. The problems that confront the manufacturers of to-day are of an educational nature. The day of exclusive features, which have been brought up by clever salesmen and thrown at prospective customers as ‘talking points’ is rapidly passing. The automobile of to-day does not depend upon sensationalism for its sales. It passed the experimental stage years ago.” The foregoing, which is quoted from the announcement of the Studebaker Company, South Bend, Ind., is given in explanation of the fact that it is not the business policy of this house to bring out yearly models of cars, such changes and improvements as are found to be necessary being made from time to time, the production of their different models neither being delayed nor precipitated by calendar dates. That this is sound business common sense has been commented upon editorially in these columns but recently.

Their present line consists of a 30-horsepower 5-passenger gasoline car, a 40-horsepower 7-passenger gasoline car and a complete range of electric vehicles for both pleasure and commercial service, the appended description, however, referring only to the chassis of the gasoline cars. In the case of both models only recognized

standards of automobile engineering have been followed, as a short résumé of their more salient features will show. Pressed steel frames of the usual channel section form the foundation in each case, the motors are of the four-cylinder vertical type, employing twin-cylinder castings with integral jackets, and a centrifugal, gear-driven pump is used to circulate the cooling water.

One point in particular will strike the observer who is familiar with the majority of American cars and the details of their power plants, and that is the accessible location of the

carbureter, this essential, in many cases, having had to make room for other accessories placed on the same side of the motor and in consequence being crowded into a most “ungettable” location. Ignition is of the low-tension type which the designer of the Studebaker chassis has so consistently adhered to and which has been brought to such a high state of development in this instance during the several years that the car has been on the American market. The source of current consists of a Simms-Bosch low-tension magneto, so arranged that it can be readily removed

[POWER-PLANT OF THE STANDARD 40-HORSEPOWER STUDEBAKER CHASSIS.

TYPE OF REAR-AXLE DRIVING UNIT EMPLOYED.

without disturbing any other part of the mechanism and so that it can be replaced without the necessity of retiming it to the motor. While the chassis in question show a great similarity in the majority of features, there is one in which they differ, and that is in the type of gear-set, or rather the method of its operation, in the case of the smaller car.

The 40-horsepower seven-passenger car is equipped with a slide change-speed gear, the shafts of which are mounted in annular ball bearings and which operates on the selective plan of gear-changing, while on the 30-horsepower chassis the progressive type of gear-set that has proved so eminently satisfactory in service on this model in past years has been retained without a change.

On both models the brakes have been made unusually large and substantial, and in the case of this essential also

ESSENTIALS OF THE TRANSMISSION, 30-HORSEPOWER CAR.

there is a slight change to be noted between the two chassis. On the smaller the pedal brake used for running service operates on a drum placed on the transmission, while the emergency brake consists of drums mounted on the driving wheels and is operated in the usual manner by means of a side lever. On the 40-horsepower chassis both sets of brakes are concentrated on the rear hubs, being of the standard internal-expanding and external-contracting type. A feature of the gear-set of this chassis is the provision of the direct drive on the third speed, the fourth speed being a step-up for speeding only, while the gear-ratio on the third speed, or direct drive, is made suitable for touring over the usual types of roads found in this country, as well as for overcoming anything but very stiff grades.

In both cases the forward axles are of the standard I-beam section and are drop-forgings of nickel-steel, while the rear axles are of the floating type. On the larger car, the latter is reinforced by a pair of side jack rods in connection with the central torsion rod of the propeller shaft drive. Comparing other features of both these cars, it will be realized how closely they adhere to the highest recognized standards as represented by current engineering practice in this field. The motors are conservatively rated, the dimensions of the larger, of 40 horsepower, being 4 3/4-inch bore by 5 1/4-inch stroke, its output being produced at a comparatively low normal speed; the smaller car is equipped with a motor the dimensions of which are 4 1/2-inch bore by 5 1/4-inch stroke.

The valve operation is identical in both cases, being of the direct thrust type, with both valves of the same size, while the motor accessories are the same in both instances throughout, an automatic carbureter, centrifugal pump, cellular radiator and positive type of mechanical force-feed oiler of the same make taking care of these essentials on both cars. The motor is protected from beneath by an enclosing aluminum pan, while the dash is made of concave form and of pressed steel. The suspension consists of semi-elliptic springs front and rear, the only difference between the cars being that of dimensions. The wheelbase of the smaller is 104 inches and its tire equipment consists of standard clincher measuring 34 by 4 inches on all four wheels, while the same dimensions in the case of the larger car are 114 inches for the wheelbase and 34 by 4 1/2-inch tires.

WHY THIS REAL ESTATE MAN USES AN AUTO.

ASBURY PARK, N. J., Jan. 27.—George W. Pittinger is a real estate broker and also an automobilist. No. 6 is his registration number, showing that he was one of the first motorists in this State to take out a license.

As a real estate man Mr. Pittinger, with his automobile, is in a class by himself. The other brokers use horses and carriages to take their clients about, but Mr. Pittinger is thoroughly up to date. It is safe to say that, all things being equal, people looking for houses to rent or buy call upon the man with an automobile first and have him take them out in his machine, going right by the other agents who have horses.

According to Mr. Pittinger his automobile is more economical, more reliable, and requires less care than a horse. His expense bill last year on the car (a single-cylinder Cadillac) averaged \$13.50 a month, which included the care of the car, repairs, gasoline, etc. He was able to do as much business with a single car as other real estate men could do with two rigs, because the automobile, unlike a horse, did not grow weary. Then there was not the need of a driver to occupy space in the vehicle, nor the necessity for hitching the machine every time a stop was made, so that, taken all in all, the advantages of the automobile in the service of this up-to-date real estate man saved its own cost many times over by reason of the increased business done.

TESTS OF GRAPHITE ON BALL BEARINGS.

There have from time to time appeared articles in the various trade papers condemning the use of graphite as a lubricant for ball bearings, says *Graphite*. Professor Goss, late of Purdue University, has made some extensive tests with Dixon's Ticonderoga flake graphite as a lubricant for ball bearings combined with kerosene oil, lard oil and vaseline, and found that friction losses were very much reduced and the bearings made to carry a heavier load. The following are extracts from Professor Goss' report.

The general appearance of the machine used in making the test is shown by Figure 1. The bearing tested was a grooved ball-thrust bearing and was made by the Standard Roller Bearing Company of Philadelphia, Pa. It consists of two hardened steel rings, each having a race to receive the balls. The bearing fits a 1 5/8 inch shaft and contains 23 7/16 inch balls. The lower race is caused to revolve through the action of the machine, while the

FOR TESTING BALL BEARINGS.

upper one is fixed in position. The pressure imposed upon the balls is regulated by means of weights applied to the lever arm, which is of such length that each ten pounds applied to the weight-pan gives a reaction of 90 pounds along the line of the spindle and thence to the test ball bearing.

It has been shown by previous experimentation that graphite can be efficiently applied as a lubricant when mixed in small quantities with oil or grease. Following this practice, six series of tests were run; the lubricant employed upon the test ball bearing being, respectively, kerosene, a mixture by weight of 96 per cent. kerosene and 4 per cent. graphite; lard oil, a mixture by weight of 96 per cent. lard oil and 4 per cent. graphite; vaseline, a mixture by weight of 96 per cent. vaseline and 4 per cent. graphite; the graphite in all cases was Dixon's Ticonderoga flake graphite.

As the result of these tests Professor Goss says in part that the following general conclusions may be drawn:

"A combination of graphite and lard oil makes a lubricating mixture which, when applied to ball bearings, will accomplish everything which lard oil alone will do and which at the same time will give a lower frictional resistance of the bearing and permit a large increase in the load which it may be made to carry. An oil as light as kerosene, when intermixed with graphite, will be converted into an effective lubricant for ball bearings when operated under light or medium heavy pressure."

AN IMPROVED FORM OF STEP BRACKET.

It has been customary with a number of automobile manufacturers to employ drop-forged brackets, or hangers, to support the running boards on their cars, but in view of the service these parts are called upon to perform this forms a comparatively expensive method of producing them.

The engineers of the Parish & Bingham Company, Cleveland, O., have made a study of this apparently unimportant part of a car, and as a result have found that both the drop-forged and the pressed steel hangers have their disadvantages. The latter are said to develop a weakness where they are riveted to the side frame and where they are bent to conform to the running board. They have accordingly designed a combination T iron and pressed-steel bracket which is shown by the accompanying reproduction from a blue-print. The illustration shows it riveted on to a section

of a side rail in such a manner that the T iron, pressed steel pieces and side rail become a composite whole when the job is finished. By referring further to the print, it will be seen that the dimensions B, C, D and E can be varied to suit the requirements of the individual manufacturer. Strength and rigidity at vital points are the advantages claimed over the pressed steel hanger, and economy of manufacture over the drop-forged type of the same style. The makers call particular attention to the pressed steel pieces on both sides of the hanger under the side rail, which act as a brace to prevent any lateral movement, a construction that is rather novel in the application in question.

THE MONKEY WRENCH IN AN EMERGENCY.

The writer was once called upon to get an automobile in running order after it had met with a collision, says E. A. Charles in *The American Machinist*.

The car was standing along the roadside out in the country, with the cooler and its supporting angle all twisted out

of shape. This cooler-supporting angle presented an appearance about as shown at A, Fig. 1, while it should have been straight, as in Fig. 2. To get the car running it was necessary to get this cross-member straightened. The only available tool was a monkey-wrench.

A wooden bar 6 feet long by 3 inches square was found along the roadside, and the wrench was fastened securely to one end of this by means of a wire, as shown in Fig. 3.

With this long lever arm on the monkey-wrench, the steel angle was straightened very easily, the cooler was placed in position and the car proceeded on its journey.

THE AMERICANIZED HELE-SHAW CLUTCH.

One of the most important developments of the past few months in the parts field has been the obtaining of the exclusive rights for this country of the Hele-Shaw multiple disk clutch by the Merchant & Evans Company, Philadelphia. Powell Evans, of the latter firm, has made considerable study of this clutch, and by making its essential elements out of

SECTIONAL VIEW OF FLYWHEEL TYPE.

effects a substantial reduction in the cost of production.

The chief difference between the Hele-Shaw and other multiple-disk clutches generally, is that in the former the rings, or disks, are made with V-shaped annular grooves formed by circumferentially corrugating the surface of the disk. The outer edge of one and the inner edge of the other of each pair of disks is notched to engage respectively with the bars or ribs of the outer casing and inner drum. The outer casing is made fast to the driving element, usually the flywheel in the case of an automobile, while the inner drum is attached to the driven shaft. In the larger sizes of these disks, the teeth are reinforced with shoes which offer an increased sliding surface.

The impossibility of obtaining long-continued satisfactory service with old types led to a close study of the problem by Professor H. S. Hele-Shaw, a well-known mechanical engineer, and after considerable investigation and experimenting he hit upon the simple expedient of employing an annular V groove in the disks. But this was not an end of the matter by any means, as exhaustive experiment was required before the proper angle for the groove to give the highest efficiency could be determined. The result of a great number of experiments finally led to the adoption of a 35-degree groove, and showed further that the rate of engagement or "pick-up" of these grooved disks was very uniform. The grooves make a clutch of the same number of disks much more powerful than the same number of flat disks under the same pressure, with a greatly reduced spring pressure to perform the same work, and at the same time no more room is required for disengaging.

Ample evidence of the maker's statement that the Hele-Shaw clutch is designed to be run continuously in a slipping condition without fear of buckling or in any other way injuring the plates, is to be found in the fact that the Brillie buses in Paris, on which they are used, operate in practice with two speeds forward, starting and running, the intermediate speeds being obtained by pedal control of the clutch. This is accom-

THE HELE-SHAW AUTO CLUTCH COMPLETE.

plished by distributing the load over all the surfaces in contact, the great number of plates with their thoroughly lubricated wedge area placing but a fraction of the load on each part, which also minimizes the wear. The Hele-Shaw clutch is made for a wide variety of uses, and in addition to a complete line for automobile, motorboat and industrial uses, the Merchant & Evans Company also manufacture the Evans change-speed gear, which is of the multiple direct-drive type combined with the rear axle, the Evans spring motor suspension chassis frame, for cab, touring car or truck use, and employing a straight-line drive requiring no universals, beside a number of other specialties such as the "Star" metal spare tire case, imported axles, and the like.

THE COMBINATION FAN-FLY WHEEL.

Numerous attempts have been made to combine the fan and flywheel in automobiles, says *The American Machinist*. These experiments have usually taken the form of a spoked flywheel with a number of sheet-metal blades cast in place between the spokes, but, owing to the very intricate pattern and core boxes, and the difficulty in moulding such wheels, their use has not been found practicable. An out-growth of these experiments has taken the form of a flywheel with several spokes—usually five or seven—which are themselves cast in the form of blades. Such flywheels have been found entirely satisfactory in practice, and some manufacturers are using them, thus dispensing with all fan parts proper at the expense of very little added complication to the flywheel. . . . Doubtless the thin sheet-metal blades of a specially designed fan would be more efficient than the thicker and rougher cast blades or spokes in the flywheel. There is another feature to consider. In front of the fan, in the space swept by the revolving blades, a slight vacuum is formed, into which the air is constantly rushing, and being carried through the fan and out of the openings provided for it. Before it is forced out through these openings, it is under a slight pressure. If the fan hub is small enough, there will probably be a space where the linear velocity of the blades, near the hub, would not be sufficient to force air against the slight pressure back of the fan, and the air currents would be reversed. For this reason the space in the flywheel occupied by the large hub would not be very effective were the hub of normal size. . . . Experiments show that for automobile service a 30-degree angle of the blades gives the best results. The edges of the blades should be as sharp as can be cast, with the center about 3-8-inch thick, and should be tied to the rim and hub by generous fillets. The general shape of the balance, and the blades and spokes of the same size and angle, each is made by a core made in the same core box. As this flywheel has seven blades, each core is one-seventh of the circumference, and contains one blade. This blade is made fast to the base of the triangular-shaped core box; the base is easily removable, as the blade parts near the hub. To further insure perfect balance, small bosses or lumps of metal are cast on the inside of the rim, between the spokes; these projections may be chipped as required when the wheel is machined and balanced. As these spokes are necessarily somewhat delicate, trouble is liable to occur through the severe strains set up in them when cooling, and fracture may result. It has been found by experiment that better results are obtained by placing the mould, after it has been poured, into a heated oven, and allowing it to cool gradually.

"In a gas engine there should be no boxes nor unnecessary ports: there must be holes for the valves, but there should be no pockets in the side, the valves all being in the head. In that way there is obtained a cylinder with the minimum surface for the maximum volume."—*Extract from Report Gas Engine Research Com. Inst. Mech. Engrs.*

THE NEW STOLP SHOCK ELIMINATOR.

Among the novelties brought forth at the Palace show last fall was one in the shape of a shock absorber that caused the technically wise to shake their heads skeptically when they saw it, and even the explanation of the inventor, Oscar Stolp, of the wire manufacturing house of Shepard & Stolp, of New York, did not suffice to convince them that the most unusual looking device was possessed of the merit claimed for it. Some of the worst doubters were taken out in Mr. Stolp's car fitted with his invention and the manner in which

STOLP DEVICE AS APPLIED.

it enabled the car to cross ruts and raised tracks without disturbing the comfort of the passengers thoroughly convinced even the most expert skeptics. But in order to demonstrate beyond any

question the practical value of his invention, Mr. Stolp has had a set of the shock eliminators fitted to one of the Locomobiles in the service of the New York City Fire Department. This car is employed in the Borough of Brooklyn, where there are many rough stretches, and the officials who have occasion to cover them at speeds are loud in their praises of the device.

The accompanying line sketch serves to illustrate both the Stolp shock eliminator itself, as well as the manner of its application. It also shows the relative positions of the connecting parts of the frame and axle, which are claimed by the inventor to be productive of a great increase in resiliency which is not accompanied by a corresponding increase in the rebound transmitted to the body of the vehicle. As will be plain from this sketch, the Stolp shock eliminator consists of a lever revolvably mounted at its after end on the axle of the car, and attached at its other end to the side frame through the medium of a helical spring. Means are also provided for the mounting of the car spring itself at a point on this lever slightly forward of the axle, instead of on the latter, as is the usual practice, from which it will be apparent that the principle of the device is radically different from that of the usual shock absorber in that the object aimed at is not to retard or control the action of the car springs, but to actually absorb the greater part of the shock before it reaches them.

The operation of the device is as follows: When the wheel passes over a depression or elevation, the axle is forced up and the car spring slightly compressed, the forward end of the lever being forced downward against its restraining spring at the same time as the main spring is pivotally attached to the lever, the latter continuing to oscillate slightly until the various members resume their normal positions. From this it will be apparent that the shock transmitted to the wheels and connecting parts, moving either to or from the car frame, will reach them in the form of two opposing forces, respectively applied to the main spring of the car and the auxiliary spring at the forward end of the lever. Since these forces are almost directly opposed to one another, their combined effect on the body of the vehicle is practically nil, as their effect is neutralized. The device is adapted to be attached to the forward wheels of the car in the same manner except that the levers are naturally designed to be placed in a position opposite to that shown. A patent was granted to Mr. Stolp covering it in April, 1907.

NOVEL REAR AXLE DRIVING UNIT.

Current engineering practice favors the combination of the gear set with the differential and bevel drive as a unit, and in designing a component of this kind the Standard Roller Bearing Company, Philadelphia, Pa., have embodied in it many features of merit. The housing is unique in that it consists of a single crucible steel casting, all the supports of bearings throughout both the gear set and differential systems being cast integral with it, thus absolutely preventing their disalignment in service. Aluminum is used in the covers to lessen the weight, one being employed over the top of the gear set and the other at the rear of the differential, thus making both very accessible. Three forward speeds are provided, the shafts and pinions being of high-grade chrome-nickel steel running on Standard annular ball bearings. The direct drive is obtained by a dental jaw clutch connection through the propeller shaft and the forward end of the secondary driving shaft, which is supported in the pocketed end of the propeller shaft on a roller bearing, thus insuring permanent alignment of the gear faces. The bevel gears and the master gear are made of high carbon steel having great capacity to resist torsional strains. The differential mechanism is mounted on Standard annular ball bearings, the driving thrust of the master gear being taken by ball thrust bearings on either side of the differential and the driving thrust of the pinion and secondary shaft being taken by a special ball bearing inserted immediately back of the pinion. Both the pinion and master gear are adjustable for wear, so they may readily always run silently. The rear axle drive-shaft and torsion tubes are of chrome-nickel steel, the last named being securely fastened

COMPONENTS OF THE STANDARD COMBINED AXLE AND GEAR-SET.

in the forward end of the main housing while it is provided at the upper end of the tube with a steel casting, carrying a ball thrust bearing and an annular ball bearing supporting the propeller shaft. The torsional strains due to stopping and starting, as well as driving, are transferred from the torsion tube directly through a cross member to the frame in a simple and effective manner. The accompanying illustration depicts the various essentials of the Standard rear-axle driving unit, which practically constitutes a complete transmission system minus the clutch, which is usually a part of the motor in reality as now constructed. In this photograph every loose or moving part has been dismounted and is displayed on the background while only the housing remains intact. From the view of the latter the accessibility of the various parts of the gear-set and differential will be apparent. A complete set of brakes is also a noteworthy feature.

MAPLEBAY AIR-COOLED RUNABOUT FROM THE NORTHWEST.]

A NEWCOMER FROM MINNESOTA.

From Crookston, Minn., has been sent forth a sturdy, speedy looking little runabout which should give a good account of itself, if its strenuous debut proves anything. The Maplebay Manufacturing Company, responsible for the newcomer, declare that it has been tried out under the severe road conditions of the West without any defect being discovered in its make up. A particularly strong feature for an automobile intended for a life on rough roads is its road clearance of 15 1-2 inches, the axles being the lowest part of the car. A four-cylinder Reeves air-cooled engine, developing 22 horsepower, is employed. A friction drive, of the firm's own design, and operated by a single lever, is employed on account of it being one of the simplest and most robust types in existence.

A HANDY SUBSTITUTE FOR A PIT.

Now and again it becomes necessary to get at the underside of a car in the garage and a means of accomplishing this without a pit is something that every autoist who takes care of his car, and many small dealers, require. T. Neville & Company, Oshkosh, Wis., have just brought out the handy truck, shown in the accompanying photograph, for this purpose. The frame is made of heavy angle iron supported by steel tubing, braced and mounted on double rollers. The bed is made of two-inch planks, so that the whole truck is very substantially made and is designed to withstand any amount of rough usage. Provision for blocking the front and rear wheels of the car so that it cannot run off the bed is in the shape of sets of movable blocks adapted to be fastened to the bed at any point by means of pins, so as to accommodate cars of any wheelbase.

HANDY TRUCK DESIGNED TO REPLACE PITS IN GARAGES.

AN EFFECTIVE SHOCK ABSORBER EXHIBIT.

That actual demonstration is worth more than all the talk that can be marshalled in favor of the good points of a device has long been recognized by the progressive manufacturer, but it remained for the Truffault-Hartford Suspension Company, 67 Vesey street, New York, to show how this could be done most effectively in the case of a shock absorber exhibited in the confines of a show booth. Two miniature cars were used, one fitted with Truffault-Hartford shock absorbers and the other without. The occupants of the former consisted of a pair of dainty wax dolls, while a rather ludicrous clown doll tried to hold down the other one. A rough road was simulated very effectively by revolving pulleys with bumps on them, the wheels being run at a normal speed. While the car fitted with the shock absorbers staid on the ground with its wheel constantly giving traction, the car without them was in the air half the time and its passengers certainly came in for a jolting. As a climax, one of the springs on the car without the shock absorbers snapped on the last day of the show, thus affording conclusive proof of their value in saving the springs.

HARTFORD-TRUFFAULT EXHIBIT AT RECENT IMPORTERS' SALON.

SEVEN CITIES WANT AUTO FIRE ENGINES.

KENOSHA, Wis., Jan. 27.—Seven cities of Southern California are ready to begin negotiations for the purchase of automobile fire engines, now that the two Rambler cars, specially built and equipped with fire-fighting apparatus for the city of Long Beach, have proven efficient.

Long Beach was the first city on the coast to order auto fire engines, and these were designed at the Rambler factory at Kenosha. They have 40-horsepower motors, a speed of thirty miles an hour is possible, and they will carry 800 feet of 2-inch jacketed hose, a 35-gallon copper chemical tank, and 200 feet of 2-inch chemical hose. Space is provided for buckets, hooks, several short ladders, axes, and four men.

In a competitive test between a Rambler car and the old horse-drawn apparatus, made before the order was placed, a short run of 3,880 feet was arranged. Everyone, except the Rambler man, put his money on the horses. The auto was to start with a dead engine. The Rambler won, making the distance in just two minutes flat. Immediately the city officials decided to replace all horse-drawn vehicles with automobiles.

Since the cars were installed the Rambler agent has invented a tilting incline platform on which the car stands level when housed. At the sound of the alarm the driver springs to the seat of the car and drops a hook which releases the chain securing the platform. The platform tips, the car glides down, and the engine starts itself and the race to the fire begins without the loss of a second's time.

HENRY FARMAN MAKING THE WORLD'S FIRST OFFICIAL FLIGHT OF ONE KILOMETER ON A HEAVIER-THAN-AIR MACHINE.

FARMAN TELLS HOW HE MADE RECORD FLIGHT

PARIS, Jan. 18.—“I had been training so long and had so much confidence in my machine and my ability to handle it that I was certain of success in my attempt to win the Deutsch-Archdeacon prize. But despite my confidence, there was just a little fear that some trivial accident might occur at the last moment and rob me of victory.

“Luckily everything passed off well; my aeroplane was perfectly stable, the motor roared powerfully and was regulated like a clock, and I knew as soon as I started upwards that success was mine. I took the turn gently, advanced the ignition as I got round, then on the straightaway home retarded the ignition, brought the machine to thirteen feet from the ground, then made straight for the flag. Before I had time to think anything more about it or gather any impressions I had won.”

It was thus that Henry Farman, champion flyer of the world, told his story of winning the Deutsch-Archdeacon prize of \$10,000, when found in his garage an hour after the event which history will recall as one of the most momentous in the struggle of man for aerial supremacy. Farman started up his motor at 10:15 on the morning of January 13, on the Issy-les-Moulineaux ground, outside the walls of Paris. After traveling twelve yards on the ground he rose to a height of thirteen feet and cut the actual starting line at that distance from the ground. An instant later he was veering towards the left and rising at the same time to a height of eighteen feet. Another second and he had swung round the post, the huge artificial bird answering her helm perfectly; another few seconds and the kilometer flight had been accomplished, time, 1 minute 28 seconds. Officially the distance is one kilometer, but as the committee's measurements are merely from the point at which the ma-

chine left the ground to the flagstaff which it succeeded in rounding, Farman should be credited, by reason of the curves which he described, with an actual flight of from 1,500 to 1,800 meters, equal to 1 mile, 140 yards.

Henry Farman, who must now be accorded the honored position of the world's champion flyer, was born in Paris thirty-five years ago. Cycling claimed him as one of its enthusiastic and skilled devotees; riding with his brother Maurice on a tandem, his victories were numerous. Racing automobiles took his attention later, and showed that he was as skilled behind the wheel of a roaring 120-horsepower as on the bicycle saddle. The story is still told in automobile circles of how in the last Gordon Bennett race he took a dangerous turn at 90 miles an hour, having mistaken it for an easier one, and shot over a precipice. The car crashed down several hundred feet, but Farman and his mechanic were caught in the branches of a thick tree. Recovering himself, Farman rolled a cigarette and called to his mechanic, unhurt a yard below, “Say, Jean, have you got a match?”

Farman announces that he will rest for a month while his second machine, on slightly improved lines, is being built by the Voisin Frères. His present aeroplane will also be strengthened and altered in a few particulars, the constant work which it has had to undergo during the last two months having weakened it. After that it is Farman's intention to go to England and compete in all the contests which offer reasonable chances of success.

During the public banquet, at which Henry Farman was presented with a check for 50,000 francs, honor was paid to the Voisin Brothers, builders of the aeroplane, and to Léon Levassor, the designer of the 50-horsepower eight-cylinder motor used on the successful aeroplane.

HENRY FARMAN, CHAMPION FLYER.

ANNOUNCEMENT

The Class Journal Company, owner of "The Automobile," has purchased "Motor Age," published in Chicago, thus signifying unhesitating confidence in the future of the great industry in the interests of which these papers are produced.

Instability of Design the Greatest American Fault.

In most lines of endeavor that can be compared to that of building automobiles, the man who has achieved success is duly appreciative of the means whereby he gained it and jealously guards the foundation upon which it is built.

The automobile-buying public may be fickle, but human nature is much the same regardless of what the thing to be bought happens to be. True, there has been a great deal

of slap-dash buying of high-priced cars in which treating has been one of the most prominent inducements, but this is now a thing of the past. The man who buys a car to-day wants to know what its predecessors were capable of doing—in other words, the reputation of its builder for stability of design, and with this fact before one, it is possible to mentally review America's most successful cars, noting that each one is distinguished by this qualification.

What inducement there may be for the successful designer of a car that has made a good name for itself to abandon his work for something new and untried is certainly a mystery, particularly in view of the fact that so many ventures of this kind get as their sole reward the obituary, "he guessed wrong that time," with a consequent shrinkage in the value of the name of the builder.

Motor Conquest of the Air Practically Accomplished. The second stage in a series of experiments which will only terminate with the complete conquest by man of the problem of aerial navigation has been reached by the magnificent exploit of Henry Farman, winner of the Deutsch-Archdeacon prize. The initial stage was reached in 1906 when Santos-Dumont first succeeded in flying through space on a machine of the heavier-than-air type.

The part played by the automobile in this titanic struggle is no inconsiderable one. Without the internal combustion engine, created and developed by the automobile, flight would have been a material impossibility. Levavasseur, whose name should be coupled with that of Farman, made flight possible by his preliminary work on lightweight motor boat engines, which he lightened, developed and perfected at a time when none but the most optimistic could see any future in the flying machine.

An Independent Organization That Is Representative.

Though only entering upon its third year of existence, the Society of Automobile Engineers is an independent engineering body that is already representative of the American industry and is daily becoming more so. A large number of designers of the best-known cars produced in this country are now enrolled in its ranks, and in view of the rate at which its membership list is increasing, there is little doubt that the present year will see the addition of many prominent names.

MONSTERS AND BABY RACERS BOTH HAVE A GRAND PRIX

PARIS, Jan. 20.—Nine foreign cars, representing Belgium, Germany and Italy, have already been officially entered in the French Grand Prix to be run the first fortnight in July on a circuit now being chosen. Those heading the list are three Germain cars to be handled by Degrais, Roch-Brault, and Perpère; three Benz, with Hemery, Hanriot and Earl as drivers, and the three Fiat with the classic team of last year, namely, Lancia, Nazzaro and Wagner. Indications are that before the list closes there will be between fifty and sixty cars entered for the greatest road race of the 1908 season. In view of such a possibility an elimination race had been spoken of, but the Racing Board has officially announced that none will be held.

Among French firms, Bayard-Clément, Dietrich, Renault, and Panhard have practically completed their teams. The three Renault cars, now well advanced, will be handled by Szisz, Caillois, and Dimitri. Bayard-Clément has signed up with Rigal and Gabriel, and is about to complete arrangements with Hautvast, the crack Belgian driver. Dietrich will have Rougier and Duray, as last year, and will probably fill the place left vacant by Gabriel by the engagement of the Italian Minoia. Demogeot and Cissac will join Heath in the formation of the Panhard team, Demogeot having become available through the decision of Darracq not to race.

Voiturette Grand Prix Will Unite Single and Two-lungers.

Whatever the number of entries, there will be no elimination for the voiturette race to be run the day before the Grand Prix, and to be known officially as the Voiturette

Grand Prix. In view of the extraordinary success which has attended previous races for single and two-cylinder runabouts of from eight to twelve horsepower, the event to precede the Grand Prix is expected to rival its successor in interest. Speeds were attained in last year's events which astounded even experts, and are a guarantee that on such a circuit as that of Dieppe an exciting contest between the baby racers will be witnessed. Regulations call for a bore of not more than 100 millimeters (3.9 inches) for single cylinder cars, 78 mm. for two cylinders, 68 mm. for three cylinders, and 62 mm. for four cylinders. Taking 4.9 inches as the longest practical stroke with a 3.9 inch bore, this would give an engine of about 15 horsepower on European rating.

Judging from previous experience, one and two-cylinder engines will be in the majority, "fours" not being popular in France for very small powers. Maximum weight for all machines is fixed at 1,322 pounds empty, but with oil in the crankcase and gear boxes. Quick change rims and dismountable rims are not allowed. A racing body, providing two seats side by side, both of which must be occupied, is allowed, mud guards and running boards being optional.

First entries for the Voiturette Grand Prix are three Isotta Fraschini, to be driven by Trucco, Minoia, and Giovanzani. The distance to be covered will be from 250 to 300 miles, racing rules in general being similar to those of the Grand Prix, drivers alone being allowed to change tires, make repairs and fill tanks. Entrance fee has been fixed at \$200 for a single car, \$360 for a team of two, and \$500 for a complete team of three cars.

NEW HAVEN'S CHIEF OF POLICE CALLS HALT.

NEW HAVEN, CONN., Jan. 27.—Chief of Police Cowles, who was recently installed at the head of the local police department, has announced a campaign against reckless drivers and the use of siren and calliope whistles on autos within the city limits of New Haven. Chief Cowles holds that the sirens come under the ordinance dealing with nuisances and has issued an order warning autoists that their use must be discontinued, at least within the city limits. Many of the Yale college students who own and drive autos in this city have been vying with each other to see who could produce the lauddest calliope or siren whistle, until the principal streets sound like the yards of a big railroad terminal.

A petition has been presented to the board of aldermen by automobilists, asking that one day each week, to be known as "auto day," be specified in which autos and other self-propelled vehicles will be allowed in East Rock, West Rock and Fort Wooster parks. These parks, which are the finest and best known natural parks in this section of the country, comprising many acres of beautiful roads and scenery, are at present closed to all motor vehicles, under penalty of a \$20 fine. This action was taken some time ago owing to a number of serious runaways and other accidents which were laid at the door of the autoists.

NO DEWAR TROPHY RACE AT ORMOND.

There will be no race for the Sir Thomas Dewar trophy at the Ormond-Daytona meet in March, the Contest Committee of the Automobile Club of America having decided to substitute a mile race for a special trophy.

The first entry for the Florida speed carnival has been made by W. Gould Brokaw, who nominated Christie's front-drive racer, built for the French Grand Prix last year. Blakely will be the driver.

NEXT A. A. A. TOUR UNDER CONSIDERATION.

Conditions for the next annual tour of the American Automobile Association, in competition for the Glidden trophy, were discussed last week, when Chairman Frank B. Hower, of the A. A. A. Touring Board, met S. D. Waldon and Windsor T. White, representing the manufacturers on the A. A. A. Central Conference Committee, and H. O. Smith, of the A. M. C. M. A., who was specially appointed by the N. A. A. M.

One of the routes most favored is said to be a start at Buffalo, west to Cleveland, south to Pittsburg, Hagerstown and Washington, and north to Baltimore, Philadelphia, New York and Boston, with the finish at Bretton Woods, in the White Mountains. The object is to obtain a route that would be difficult and at the same time lead through a district that can be of most benefit to the automobile industry. There are several suggested changes in conditions, and a definite announcement is expected next week.

THE LATEST BILL AT ALBANY, N. Y.

ALBANY, N. Y., Jan. 27.—Senator McCall introduced a bill to-night amending the motor vehicle law so as to change the speed limit for motor vehicles from one mile in six minutes to one mile in five minutes. This would permit the driving of autos at a rate of twelve miles an hour instead of ten miles an hour, as the law now prescribes in cities, villages and all localities which are built up.

A. M. C. M. A. ANNUAL, DETROIT, FEB. 8.

In accordance with a vote of the members of the American Motor Car Manufacturers' Association, it has been decided to hold the annual meeting of the association in Detroit, Mich., Saturday, February 8.

AMONG THE ACTIVE DOERS IN CLUB LIFE

BAY STATE A. A. TO RUN WASHINGTON'S DAY.

BOSTON, Jan. 27.—The Bay State Automobile Association is to open the 1908 competitive season with an endurance run on Washington's birthday, February 22. The recently-appointed runs and tours committee made this announcement to-day, and it also announced that the run would be 150 miles in length over a triangular course of 50 miles to a leg. The route will be from Boston to Providence, Providence to Worcester, and Worcester to Boston. In selecting this route the committee has had in mind the probable condition of the roads the latter part of February, and it believes that the roads that have been chosen will be the best available at that time of year. They are less likely to be covered with snow and ice than are the highways to the north and east of Boston.

No rules have yet been announced, but the committee has this matter under consideration. The run to Keene last July was so successful and the club received so many compliments upon its conduct of the contest that it is probable that the same rules will be taken as the basis of those governing the coming contest. The committee has in hand, however, the rules of the Chicago and the Philadelphia endurance runs and will make such changes as seem desirable. As the date of the run is only about a fortnight before the opening of the Boston show, when all the dealers will have their new models and when public interest in the new product will be greatest, it is believed that there will be many entries in the run. The committee in charge consists of J. C. Kerrison, chairman; Horace G. Kemp, E. A. Gilmore and Alfred N. Robbins.

SEASON PLANS OF THE WASHINGTONIANS.

WASHINGTON, D. C., Jan. 27.—President Caverley, of the Automobile Club of Washington, has sent a personal letter to each of the members urging their co-operation in increasing the membership. His letter in part is as follows:

"Some ambitious projects are contemplated during the coming season. A race meet at the Benning race track under the auspices of the club is planned for Decoration Day. A club run to Natural Bridge, Va., via Winchester and Staunton, a distance of some 200 miles over some of the finest roads and through one of the most picturesque sections of the country, is also on the cards. This trip has been taken by several members of the club, who are enthusiastic about the valley of Virginia as a touring ground, where cars, both large and small, find easy traveling. Several short runs to Braddock Heights, Md., Buena Vista Springs, Va., and other interesting points within a radius of 100 miles of Washington, are also in prospect."

CHICAGO A. C. TO WORK FOR NATIONAL LAW.

CHICAGO, Jan. 27.—The Chicago Automobile Club has voted to give its hearty support to the Legislative Board of the American Automobile Association in the congressional campaign for the Federal registration bill. Sidney S. Gorham and his colleagues on the legislative committee of the club have been instructed to give active assistance to the national body. Illinois motorists in favor of the proposed national registration are urged to write their views to Congressman Sterling, of Bloomington, Ill., who is a member of the judiciary committee of Congress, to which the bill has been referred. The directors tabled a communication asking the club to join a revolt against the present state of affairs in the management of the A. A. A.

NOTABLE AUTOISTS AT A. C. OF P. BANQUET.

PHILADELPHIA, Jan. 27.—There will be a great gathering of the automobile clans on the occasion of the annual banquet of the Automobile Club of Philadelphia, on Friday evening, February 28. Among those who will probably attend, and have something to say, are Charles T. Terry, chairman of the Legislative Board of the A. A. A.; Colgate Hoyt, president of the Automobile Club of America; John Bancroft, president of the Delaware Automobile Association; Osborne I. Yellott, president of the Maryland State Automobile Association; Robert P. Hooper, of the Pennsylvania Motor Federation and the Automobile Club of Germantown; Cortland F. Bishop, president of the Aero Club of America; Robert B. Caverly, president of the Automobile Club of Washington, D. C., not to mention numerous local and State officials, including Governor Stuart and Mayor Reyburn.

With a membership of about 550 the Automobile Club of Philadelphia was never in such a flourishing condition, and the attendance will, in all probability, be very large.

LONG ISLAND CLUB TO CONSIDER FEDERAL LAW.

BROOKLYN, N. Y., Jan. 27.—Charles Thaddeus Terry, Chairman of the A. A. A. Legislative Board, will address the members of the Long Island Automobile Club on Friday, January 31, on the Federal Registration bill and the Uniform Motor Vehicle bill drawn up by his board.

By a decision of the board of governors the club has been empowered to secure surety company bail bonds for the use of members, the same to be furnished upon request of any member arrested for alleged violation of the motor vehicle law, the expense thereof being regularly charged to the account of the member securing the use of the bonds.

PENNSYLVANIA HAS ANOTHER AUTO CLUB.

NEW CASTLE, PA., Jan. 27.—At a meeting last week the Auto Club of Lawrence County put itself on a sound basis and adopted by-laws, rules and regulations for its future guidance. Over a dozen new members joined the club at the meeting, and a strong effort will be made to enlist the co-operation of all automobile owners of the district, a committee being appointed to call on automobilists for this purpose. Arrangements were made for the banquet of the road supervisors of Lawrence county, and the decision formed to hold a meeting first Monday in February for the election of officers. David Jameson is now chairman of the club.

STRONG RECOGNITION FOR CHICAGO A. A. A.

CHICAGO, Jan. 27.—President L. E. Myers, of the Illinois State Automobile Association, announces the appointment of the chairmen of five of the committees of that association as follows: Signboards, Joseph V. Lawrence, Chicago Motor Club; legislative, Sidney S. Gorham, Chicago Automobile Club; good roads, L. C. Boardman, Chicago Motor Club; membership, Burley B. Ayres, Chicago Motor Club; publicity, C. G. Sinsabaugh. Paul Picard has been made a director of the association.

RICHMOND COUNTY CLUB ELECTS OFFICERS.

ST. GEORGE, N. Y., Jan. 27.—At the annual meeting of the Richmond County Automobile Club, of St. George, N. Y., Charles A. Schultz was re-elected president. Other officers chosen were vice-president, O. W. Sprigg; secretary, J. J. Worrell; trustee for three years, Dr. J. W. Musgrove.

SAVANNAH COURSE :

A race for six-cylinder stock chassis will form one of the novel features of the speed tests over the 18-mile course near Savannah, March 18 and 19. The race will not be held unless there are five entries, but in view of the popularity of the six-cylinder runabout, this condition will certainly be met. The trophy will be the Southern Six-cylinder Cup. The six-cylinder contestants will be limited to a cylinder displacement of 575 cubic inches.

Preceding the six-cylinder contest will be a stock runabout race for machines not exceeding 375 cubic inches piston displacement, the trophy to be the Southern Runabout Cup. The big feature of the meet will be the 360-mile speed test for stock chassis not exceeding 575 cubic inches piston displacement, the prize being the Southern Challenge trophy, valued at \$3,000.

Harvey Granger, treasurer of the Savannah Automobile Club Race Committee, on a visit to New

SCENES ON THE SAVANNAH COURSE, WHERE STOCK CHASSIS RACES WILL BE RUN MARCH 18 AND 19.

THREE BIG RACES.

York to complete arrangements, reports tremendous enthusiasm in the South over the proposed races. The militia companies who will provide an efficient guard over eighteen miles of the finest and most picturesque road to be found in the country, are so enthusiastic over the event that they turned out in full force when a call was made for them to assemble for field telephone practice. The Transportation Committee has succeeded in getting excursion rates on all railroads in Savannah from points 200 miles around, and has promise of a rate of one fare and a third for the round trip from New York. Some of the citizens of Kokomo, Ind., in their enthusiasm to watch the performance of the Apperson Jackrabbit, have chartered a special Pullman car for the trip. The Apperson people state that they will have four cars on the ground early in February; the Premier Company will ship three cars within a week.

CONCERNING SPEED INDICATORS OF CENTRIFUGAL TYPES

Editor THE AUTOMOBILE:

IN your issue of December 19, 1907, you published an article under the title "Principles of Speed and Distance Recorders," written by Charles B. Hayward, in which appear several statements that are wholly inaccurate and misleading, and one in particular, to which we take exception. On page 912, first column in his description of the centrifugal force type of speedometer, he says:

"It will be evident from this that the faster the spindle turns, corresponding to an increased speed on the part of the car, the greater will be the tendency of the brass ring to take up a position at right angles to its shaft. But, bearing in mind the varying tension or compression of a spring with an increase in its load, the question will naturally arise: How can the instrument be made accurate at all speeds over a range from a few miles an hour up to a mile a minute? In the first place, the dial is calibrated according to the varying control of the spring at different speeds, the divisions accordingly not being uniform over the entire scale."

If Mr. Hayward was thoroughly posted on speedometer construction, or had only examined the dials of the Stewart and American speedometers, he could have seen at a glance that in these instruments at least the dials are equally calibrated their entire length.

Our catalogue also explains this exclusive feature of our speedometers under the heading, "Description of Instruments," from which we quote as follows:

"The Stewart speedometer embraces a device for transmitting the movement of a part, which is centrifugally actuated, and modifying that movement to actuate the indicating pointer proportionate to the change in speed. To cause the angular movement of the index finger to correspond perfectly to the changing speed, variations in the force, caused by the speed of the centrifugal element and variations of the strength of the spring restraining it, must be compensated for. In the Stewart speedometer this is accomplished by interposing a cam between the centrifugal element and the indexing means. The profile of this cam is shaped in the final assembly of each instrument so as to cause the index finger to indicate exactly the speed at which the vehicle is traveling.

In the process of manufacture, each instrument is mounted on a specially devised calibrating machine and all speeds from minimum to maximum are corrected by means of changes in the profile of the previously described cam surface. Once these corrections are made, the instrument is accurate forever—wear sufficient to cause appreciable inaccuracy being negligible."

Again in our catalogue, page 15, under the title, "Scale Is Equally Spaced," we say:

"The evenly spaced scale is evidence of a principle properly applied. The difficulties that makers formerly contended with and endeavored to correct by using an unequal scale, we correct in the mechanism of the instrument itself, which feature is fully covered by patents.

"The unequal scale is not only a disfigurement, but tends to deceive the eye. There is also a tendency to doubt the accuracy of an instrument that will measure the first ten miles in inches and the last twenty miles in a space so small as to be read with difficulty. Observe the ease with which the Stewart dial may be read."

Mr. Hayward also states that the extreme of simplicity is not secured in the centrifugal type and in another type, which he describes, claims it to be competent of a degree of accuracy unattainable in other fields, from which the reader must infer that the centrifugal force type is of complicated construction and inaccurate. Inasmuch as he has erred regarding equal calibration of the centrifugal type, it is evident he is not acquainted with the construction of Stewart or American speedometers and may have qualified his statement as regards simplicity and accuracy had he been familiar with these instruments. When an instrument is absolutely accurate, it leaves nothing to be desired in the degrees of accuracy, and as our patented cam (as explained) permits of adjustments that secure indisputable accuracy, it is difficult to distinguish the degree of accuracy he credits to this other type as not attainable in ours.

We take exception to Mr. Hayward's statements because it is due to the many thousands who are using Stewart and American speedometers to know that the failings he ascribes to the centrifugal force type of speed indicator do not apply to ours. After all is said, a theoretical discussion of the relative merits of different types counts for nothing as against what the same instruments will do in actual service. It is the tried and proven that must be recognized as against the unproven. We want to say for the benefit of those car owners who may be at a loss to know which type to purchase that they test for themselves the different types and we will gladly at all times furnish either of our instruments to be put on the car in competition with any other on the market and abide by the result.

STEWART & CLARK MANUFACTURING COMPANY.

CHICAGO, Jan. 27, 1908.

AKRON TIRE COMPANIES HOLD ELECTIONS.

AKRON, O., Jan. 27.—At the annual meeting of the B. F. Goodrich Company this week, the old board of directors were elected as follows: Col. George T. Perkins, F. H. Mason, B. G. Work, E. C. Shaw, H. R. Raymond, C. C. Goodrich, George W. Crouse. The directors elected officers as follows: President, B. G. Work; first vice-president, F. H. Mason; second vice-president and general sales manager, H. E. Raymond; secretary, C. B. Raymond; assistant treasurer, W. A. Means; general manager of works, E. C. Shaw.

The annual meeting of the Swinehart Clincher Tire & Rubber Company resulted in the election of the following directors: J. A. Swinehart, B. C. Swinehart, W. J. Frank, J. W. Rock, C. O. Baughman and W. H. Rudgers, who chose the following officers: President, J. A. Swinehart; vice-president, B. C. Swinehart; secretary and treasurer, C. O. Baughman. According to the report of the president, the past year has been a prosperous one, and in support of his statement he stated that in the year 1904 the output of the company was 2,527 tires, while at present the company has out and in use over 20,000 tires. Mr. Swinehart stated that the increased business was largely due to the more favorable attitude of garage men. The company will establish branch houses in Philadelphia and St. Louis soon.

RETAIL DEALERS WILL FORM AN ASSOCIATION.

A movement is on foot for the enrolling of the 2,000 retail automobile dealers of the United States into a national organization, to be known as the Association of Automobile Dealers of America. It is declared that the dealers, who last year sold 50,000 cars at a valuation of nearly \$100,000,000, could, by co-operation, bring about many much needed reforms in transportation charges, improve the second-hand car business, keep records of salesmen, mechanics and chauffeurs, and do much to remedy unbusinesslike methods. Charles A. Wardle, who has for some years been connected with the A. L. A. M., will be manager of the association.

GROUT FACTORY NOW IN NEW HANDS.

ORANGE, MASS., Jan. 27.—The entire plant of the Grout Bros. Automobile Company in Orange has been sold to Wm. L. Grout, the millionaire sewing-machine manufacturer, of Greenfield, Mass.—the Grout Bros. having completely withdrawn from the business. The future active management will be in the hands of well known automobile men, and the plant will be run upon a larger scale than ever before. The latest model embraces all of the latest and best features in automobile construction.

AFTER THE BIG SNOW IN WISCONSIN PURCHASERS OF RAMBLERS WERE GIVEN DEMONSTRATIONS NEAR THE KENOSHA FACTORY.

MR. BRISCOE'S WESTERN OBSERVATIONS.

THAT the recent financial crisis was only a rich man's panic is the belief of Benjamin Briscoe, chairman of the Committee of Management of the American Motor Car Manufacturers' Association, who has just returned from a two weeks' Western trip. In speaking of his trip Mr. Briscoe said: "There is no question in my mind that the recent crisis in Wall Street was merely a rich man's panic, brought on by certain conditions which I believe can be blamed to a group of financial pirates who have been plunging heavily and recklessly; many of them using the people's money. I have come to this conclusion after thoroughly studying the situation and after lengthy talks with prominent Western banking and manufacturing interests. The West was never in a more healthy and flourishing condition. The crops are heavier than at any time in the history of the country."

COLONEL CLIFTON ON THE OUTLOOK.

BUFFALO, N. Y., Jan. 27.—The recent financial troubles which were felt throughout the country did not materially affect the working forces of the George N. Pierce Company and the E. R. Thomas Company, of this city. Col. Charles Clifton, of the Pierce Company, said: "The future of the automobile industry does not hinge upon the present financial conditions. The fact seems to be that every line of industry suffers from the stagnation, and the automobile makers are seemingly but waiting for the revival which is not far off. I have learned that other industries have even cut their helping force in half. This is not true in automobile circles, for to-day we are employing nearly our entire force and turning out more cars than last year." The word from the Thomas factory is that the great demand is for their highest priced car, the big six-cylinder Flyer.

A TOUCH OF REAL WINTER IN CENTRAL PARK, NEW YORK CITY, AND THE PACKARD DOING DUTY AS A SNOW PLOW

AMERICAN ROADSTER THAT MADE FASTEST TIME AT HOUSTON.

ENDURANCE RUN OF HOUSTON'S AUTO CLUB.

HOUSTON, TEX., Jan. 27.—Weather conditions that were favorable ushered in the day set for the endurance run of the Houston Automobile Club, on January 12, and fifteen cars participated. A most successful run it promised to be, but several accidents, one in which one of the cars collided with a street car resulted fatally, resulted in the run being officially called off by the officials. All of the cars, with the exception of three, finished with perfect scores, however, and the best time of the day was made by the American Roadster, driven by E. A. Sontag, who covered a distance of five miles on the straightaway shell road between Cypress and Houston, at the rate of seventy miles an hour. The endurance test was not to be a race, but local rivalry between car owners and dealers made the run decidedly interesting from a speed standpoint. The following cars finished with unofficial perfect scores:

- American Roadster, 40-horsepower, driven by E. A. Sontag, for Empire State Motor Company.
- Frayser-Miller, 50-horsepower, owned and driven by W. T. McCallip.
- Bulek, 22-horsepower, owned and driven by Max Stubenrauch.
- Dixie-Flyer, 28-horsepower, driven by Mr. Ayres, for Southern Motor Company.
- Ford, 20-horsepower, driven by Van Curtis, for Wade Cox.
- Frayser-Miller, 50-horsepower, driven by W. C. Monroe, for Barden Electric and Machinery Company.
- Wayne, 30-horsepower, owned and driven by Edward F. Marone.
- Overland, 20-horsepower, owned and driven by John Patrick.
- Ford, 40-horsepower, driven by Wade Cox, for H. T. D. Wilson.
- Maxwell, 14-horsepower, owned and driven by R. W. Aiken.
- Thomas, 40-horsepower, owned and driven by J. K. Foley.
- Ford, 15-horsepower, owned and driven by R. R. Ratcliff.

The Houston Automobile Club now has a membership of 60 and is rapidly gaining in local influence. An appropriation of \$500,000 is to be spent on the roads of the county, and the club has had much to do with securing this handsome sum for road improvement. Harris county now has 200 automobiles, the largest number of any county in Texas.

DIXIE FLYER THAT FINISHED WITH A PERFECT SCORE.

OWEN STARTS ON SECOND "MUDLARK" TRIP.

ALBANY, N. Y., Jan. 27.—Equipped with a formidable array of shovels, picks, ropes and tackle for emergency work, Ralph Owen, in a 40-horsepower Oldsmobile, arrived here to-night on a pathfinding trip from New York to New Orleans. The object of the trip is three-fold. The first being the gathering of data relative to the roads between New York and the metropolis of the gulf; the second to gather data relative to the political situation, and the third it is expected that the car which Mr. Owen is driving, at the completion of its trip, will be used as the official car at the Mardi Gras celebration beginning the end of February.

From Cleveland to Louisville, Birmingham and New Orleans, Mr. Owen will attempt to find the shortest and best roads. The information and route will be published in pamphlet form for the benefit of the motoring public.

At Cleveland F. L. Smith will join the party, and from then on will make a canvass of the towns through which they pass relative to the political situation, endeavoring as far as possible to get the strength of the various presidential candidates. The information thus gained will be given to the newspapers and to the national political committees.

RALPH OWEN IN HIS OLDSMOBILE READY FOR THE START.

JANUARY AUTOMOBILE TRADE DIRECTORY.

Three hundred and four pages comprise the January issue of the "Automobile Trade Directory," published quarterly by the Class Journal Company, Flatiron Building, New York. The Directory, which covers not only the entire automobile industry of the United States, but includes every industry which in any way contributes to the production, operation or care of horseless vehicles, is classified in the simplest and most efficient manner. An idea of the extent of the ground covered is obtained from the fact that the index to classifications alone calls for more than 1,400 headings. Manufacturers in each branch of the automobile industry are classified under the heading of the goods they produce, there being sufficient divisions in all the branches of the trade to make the reference as simple as possible. Thus under the heading tubing, are separate divisions for makers of brass and copper tubing, flexible metallic tubing, soft rubber tubing, hard rubber tubing, and steel tubing. This system is pursued throughout the entire industry. The compilers claim that the lists are brought up to date with each issue, that every firm is included, and that all the firms are producing the articles under which they are classified. A series of tables and data for engineers form a valuable addition for reference purposes.

CLEVELAND PATHFINDER, FULLY EQUIPPED FOR THE PIONEER RUN FROM JACKSONVILLE TO MIAMI, FLA.

ORMOND PATHFINDER REPORTS PROGRESS.

Official Pathfinder Cleveland, forerunner of the batch of tourists who will make the trip from Jacksonville to Miami, Florida, reports a complete string of signposts in its wake as far as Ormond.

The big Cleveland touring car, with James Laughlin, 3d, at the wheel; George E. Sebring, of Daytona; Walter S. Drennen, and Photographer Spooner, in the tonneau, and a pioneer outfit on the running board, started from Jacksonville on January 23, and reached St. Augustine the same evening. It had been intended to make Ormond that night, but owing to several departures from the right track for the purpose of verifying the cross roads and placing signs, much time was lost. Though the finding of the path the first day out was a comparatively easy matter, the party managed to get lost twice. Roads consisted, for the most part, of a hard and sometimes rough path through the scrub palmetto, and the only scenery was the same scrub and the high pine trees cut and bucketed by the turpentine men. Six fords had to be passed through, but they were all of hard bottom.

Partly because the shades of night were overtaking them fast and partly because a raging forest fire overtook them seventeen miles from Ormond, the Cleveland pathfinder had to be pushed to its utmost at the close of the second day out. The fire was an unrehearsed thriller which loomed up one hundred yards away when the car had just passed over the second automobile bridge erected by Thomas White, of Cleveland. After a second's hesitation it was decided to rush the machine along the edge of the forest conflagration. It was an exciting moment, for the flames rose to a height of ten to fifteen feet, and threatened to reach the automobile. A wild cat rushed yelling before the flames, then a dense wood with thick overhanging foliage was plunged into and the car pulled up finally at Ormond, having covered a distance of 84.9 miles for the day. There was a stretch on the fine shell road outside St. Augustine where a speed of 55 miles an hour could be maintained, but the average going through turpentine camps and stills was of a much more modest nature. Though there will be some rough riding, there will be no difficulty in finding the trail, for the Cleveland pioneer has placarded every spot.

S. A. E. BECOMING MORE REPRESENTATIVE.

That the need for independent engineering investigation wholly free from any trade affiliations is generally recognized is evident from the manner in which the membership of the Society of Automobile Engineers is rapidly increasing. Though only entering upon its third year of existence, it already includes in its ranks a large percentage of the designers of the most prominent cars built in this country.

Among them are Russell Huff, engineer of the Packard Company; David Fergusson, designer of the Pierce cars; A. L. Riker, designer of the Locomobile; Harold B. Anderson, chief engineer of the Winton Company; Henry Ford, head of the Ford Motor Company, and designer of all the Ford cars; B. D. Gray, chief engineer of the American Locomotive Automobile Company, builders of the Berliet; J. G. Perrin, designer of the Lozier; W. A. Wall, of the National Motor Vehicle Company; Alanson P. Brush, former designer of the Cadillac, and more recently of the Brush runabout; Hiram P. Maxim, late chief engineer of the Electric Vehicle Company, and designer of the Columbia gasoline and electric cars, and who is now building a line of new electrics; John Wilkinson, designer of the Franklin cars; Harry A. Knox, president of the Atlas Motor Car Company; Thomas J. Fay, who was responsible for the first Simplex cars and later designed the Ellsworth; Walter C. Baker, formerly of the Baker Motor Vehicle Company; Henry Souther, consulting engineer and metallurgist of the Association of Licensed Automobile Manufacturers; C. R. Greuter, designer of the Matheson cars; C. T. Jefferys, of the well known firm that builds the Rambler cars; Howard E. Coffin, of the Thomas Detroit factory; E. T. Birdsall, designer of the new Selden cars; F. B. Stearns, head of the company of the same name building the Stearns cars; Joseph Tracy, the well-known racing driver and consulting engineer; Charles E. Duryea, consulting engineer of the American Motor Car Manufacturers' Association; Herman F. Cuntz, the leading technical spirit of the Licensed Association and a number of others prominent in the automobile world. It is the intention of its founders that it should be representative of the industry as a whole, and to accomplish this end it is open to manufacturers of accessories and their authorized technical assistants, who are admitted to associate membership.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The first Model H Marmon water-cooled car arrived in Boston last week. Howard Marmon, of the Nordyke & Marmon Company, is explaining its many new features to the local agent, F. E. Wrag.

Two licenses were revoked by the Massachusetts Highway Commission last week, and among the large number of new licenses granted was one to an 11-year-old son of a prominent Boston auto dealer.

Its plant having been badly damaged by fire, the Delaware Auto Storage and Repair Company, of Wilmington, Del., has gone into the hands of a receiver, Christopher L. Ward being named as such by the Court of Chancery.

The Brown Auto Top Company, of Philadelphia, has inaugurated a new deal by establishing a general automobile repair shop at the Belmont avenue entrance to Fairmount Park. The new shop will be run in connection with the Belmont Garage.

Registrations in the State of New York, on Thursday, January 23, reached the 50,000 mark, license number 50,000 having been issued to the Lozier Motor Company. This number will be carried by the Lozier demonstrating cars during the 1908 season.

Though it was only incorporated in 1904, the London Auto Supply Company, 1229 Michigan avenue, Chicago, makers of the London auto tops, Lasco folding glass fronts and windshields, has found it necessary to increase its manufacturing facilities and obtain more room on several occasions. Due to the general satisfaction given by their tops and glass fronts, their sales were more than doubled during the past season. An attractively illustrated catalogue showing the entire line has just been issued.

In connection with their electric pleasure and commercial cars, the Studebaker Automobile Company, South Bend, Ind., are now marketing mercury arc rectifiers to transform alternating current, as commonly employed for lighting and power purposes, to direct current, in order that it may be utilized for charging batteries. The introduction of the rectifier is claimed to reduce the already low cost of operation of the electric more than one-half, so that where the expense of charging a two-passenger electric vehicle has formerly averaged \$25 to \$30 a month, it should not now exceed \$8 to \$10 a month.

The factory of the Wayne Automobile Company, in Detroit, is one of the number that has not been completely shut down at any time during the recent financial disturbance and preparations are now being made to resume with a full force in a very short time. Further evidence of the fact that these builders have not been disconcerted in the least is to be found in the fact that they are now going ahead with the construction of a large testing course adjacent to the works in Piquette street, Detroit. When the property was acquired some years ago, a large piece of land was left vacant for this purpose, but it was not until the present year that the company cared to go to the expense of building the track.

The effect of ball-bearings on the efficiency of a car is immediately apparent in its ton-mile capacity per gallon of fuel, and the Hess-Bright Manufacturing Com-

pany, Philadelphia, Pa., calls attention to the showing of cars equipped with Hess-Bright ball-bearings as compared with those not having this advantage. The Chicago Economy test of last fall brought out 23 cars of 18 different makes, the distance being 95 miles. The winning car, which averaged 45.4 ton-miles per gallon, was equipped with "HB" bearings, as were also 12 cars of 7 different makes which averaged 32.7 ton-miles per gallon, as against 28.3 ton-miles for the remainder. The cars that scored second and third were also thus equipped.

Suit has been entered by Hopewell Brothers, of Cambridge, Mass., through their patent attorneys, Crosby & Gregory, against the Boston branch of the Post & Lester Company, of Hartford, Conn., for selling the Perfect tire case manufactured by W. H. Wiley & Son, of Hartford, and which is alleged to be a direct infringement of their patent. The recent action brought against the Auto Supply Company, of Boston, agents for the Allen tire case, has been discontinued, a satisfactory settlement having been reached. The Allen Auto Specialty Company, of New York, will henceforth handle the Hopewell Brothers' fabric line in its entirety in the States of New York, New Jersey and Pennsylvania.

As the result of the "Continental canvass" made by General Manager J. M. Gilbert, of the Continental Caoutchouc Company, he has found that things are not half as bad as they seem to some people. "Automobiling as a sport is in a pretty lively condition as yet," said Mr. Gilbert when seen at the Continental headquarters, at 43 Warren street, New York City. "There is plenty of vitality in the industry and the demand for new cars goes to show that there are a good many people who have ready cash and who are willing to spend it for what they want." Mr. Gilbert's canvass was not of the haphazard or hearsay order, inquiries being made throughout the country and the results carefully tabulated, the manufacturing establishments in Detroit, Cleveland, Buffalo, Chicago, Indianapolis and other cities being well covered. Many of the plants that were shut down entirely are now running full time and many others are making preparations to resume shortly.

NEW AGENCIES ESTABLISHED.

Jacobs & Bartlett have opened their new salesrooms at 887 Boylston street, Boston, and will represent the Allen-Kingston cars in Boston and vicinity.

A motorcycle store, devoted to motorcycles only, has been opened by the American Motor Company, 218 Clarendon street, Boston, where the M. M. motorcycles will be carried exclusively.

The Glide car will be handled in St. Louis and western Missouri during the present year by the Weber Implement Company, 415 West Main street, St. Louis. The Dupree Commission Company, Waco, Texas, will handle the Glide in central Texas territory.

J. D. Lee, Jr., local manager of the Girard Motor Car Company, of Philadelphia, has just secured the agency for the Fiat for Eastern Pennsylvania. Allen Dalley was the former local representative. The

Girard Company already handles the Cleveland and the American Mors.

C. A. Benjamin, of the Aerocar Motor Company, of Detroit, has been taking a whirl through some of the Eastern States during the past ten days closing contracts for agencies for 1908, and reports the following connections to handle the Aerocar line: The George H. Lowe Company, Boston; G. M. Drake, Huntington, L. I.; George A. Bauer, Rochester, N. Y.; Maxwell Auto Company, Erie, Pa.

Arrangements have been completed by Paul Lacroix for direct Renault representation at 1549 Michigan avenue, Chicago. The Western house, which will be in charge of C. T. Ziegler, will be a branch of the Renault Frères Selling Branch at New York, and, like the metropolitan establishment, will carry all models, be completely supplied with spare parts, and equipped for repair work. An expert mechanic is being sent from the Billancourt factory to take charge of this department. Philadelphia and Eastern Pennsylvania will be supplied with Renault cars by Prescott Adamson, located at Broad and Spring Garden streets, this agency, now handling Columbia gasoline and electric cars, having closed contracts for the representation of the popular French marque.

RECENT TRADE REMOVALS.

The Boston Auto Light Company, formerly located in the Motor Mart, that city, has moved into a larger salesroom, more centrally located, at 751 Boylston street.

The local G. & J. tire agency, at 711 North Broad street, Philadelphia, will move to much larger quarters next door, at No. 713, about March 1. The new building is 30 by 140 feet in dimensions, and will afford ample accommodations for the rapidly growing business of the agency.

The Cameron Motor Car Company, of Brockton, Mass., has purchased the building and equipment of the Beverley Manufacturing Company, at Beverley, Mass., which was formerly devoted to the Upton transmission gears. This plant will be run in connection with their present works at Brockton. The main offices of the company will be at the Beverley plant.

The Palmer & Singer Manufacturing Company are now installed in their new quarters, at 1620, 1622 and 1624 Broadway, from which address the Simplex, the Isotta-Fraschini and the three lines of Palmer & Singer cars will be marketed. Four floors of the building are devoted to the garage, which has a capacity of 150 cars, making it one of the largest on Broadway. Owing to its convenient situation, it has sprung into immediate popularity with the residents of the Circle district.

PERSONAL TRADE MENTION.

P. O. Sheehan, well-known throughout the bicycle and automobile trade, resigned last week as sales manager of the Old Colony Light Company, of Boston, makers of the Puritan gas tanks.

J. S. Draper, of the Wayne Automobile Company, is the guest of the Boston representatives of the Wayne, the Morrison-Price Company. Mr. Draper reports that business is steadily improving in the East.

INFORMATION FOR AUTO USERS

Stitch-in-Time Vulcanizers.—The prolongation of the life of an automobile tire is assured by attention to the use of a vulcanizer whenever defects reveal themselves. Three distinct models of these instruments, now extensively used by automobilists, are manufactured by the Stitch-in-Time Vulcanizer Company, Topeka, Kansas. The latest of the trio is the "Stitch Nine" vulcanizer, specially

THE NEW "STITCH NINE" VULCANIZER.

designed to fit flat tread tires, and for mending inner tubes. Its special features are that it can be heated by either gas or gasoline without changing burners, will fit any tire from the smallest to the largest, in both circumference and diameter, and has a swivel yoke admitting of the faces of the vulcanizer adjusting themselves to equal pressure at every point of contact. The "Stitch Nine," which is made of aluminum and weighs only three pounds, will vulcanize either on the tread or side close up to the rim. The two other instruments are the "Pig" vulcanizer, which will take a patch from 9 to 10 inches long the full oval of the tire, to 1 1/2 inches of the rim, and the "Stitch-in-Time" vulcanizer for smaller repairs.

Dover Safety Waste Cans.—The rules of the Board of Fire Underwriters call for the placing of all oily waste and rags in a metal receptacle with a cover of the same material, as such substances are apt

DOVER WASTE CAN WITH SPRING COVER.

to take fire spontaneously. To meet these requirements, the Dover Stamping & Manufacturing Company, 385 Putnam avenue, Cambridge, Mass., are putting on the market a can of this type which is provided with a recently-invented self-closing cover. The device is extremely simple and durable, beside being positive in action, so that

the cover is always kept tightly closed. The can itself is of heavy, durable construction. By a new method of construction exclusive with these makers, no solder is used in the construction of the can. The material consists of black steel sheets, galvanized after making, so that they will stand the hottest fire without falling apart. They are made in six sizes, ranging from 12 by 15 inches up to 24 by 38 1/2 inches, and have been especially designed for garage and factory use. The illustration gives an idea of the general appearance of the complete can, as well as that of the self-closing cover.

Half-Nelson Emergency Tires.—Running on a flat tire means the price of a new shoe as well as a new tube, while any distance on the rim entails the expense of a replacement there, so that it certainly does not pay to be caught far from home or a repair shop without some means of protecting the wheel and rim. Realizing this, the Half-Nelson Tire Company, 1917

Portland street, Minneapolis, Minn., have brought out a patented emergency tire of this name which will pay for itself by the aid rendered in a single case of emergency. The Half-Nelson emergency tire consists of a number of independent sections with a double hook and eye device that cannot possibly pull apart, the last joint which is tightened up when the tire is in place on the wheel being made with a right and left-handed screw. The details of the two forms of joints are shown in the accompanying illustration.

METHODS OF FASTENING HALF-NELSON TIRE.

Pence Limousine Heater.—The necessity for heating the interior of a closed car during winter is evident, while the problem entailed would appear to be of the simplest nature, as many times the amount of heat required is being wasted through the muffler every minute the motor is running. But not every attempt at

accomplishing this has proved successful by any means, many having the disadvantage of introducing the burnt gases from the cylinder directly into the car, making the heat a cause of annoyance rather than a comfort. To overcome this, the Pence Automobile Company, 717-719 Hennepin avenue, Minneapolis, Minn., has

HOW THE PENCE HEATER IS APPLIED AND USED.

recently perfected an improved type of heater for this purpose. As shown by the accompanying illustration, it consists of a special jacket for the muffler with an inlet for pure cold air at the bottom forward, and an outlet for the heated air connected with a register placed flush with the floor of the car. Only pure air is warmed and introduced.

A Speed and Distance Recorder.—The latest development in the line of speed indicators is the Velograph, produced by Velograph, Limited, of Berlin, and sold in America by the National Sales Corpora-

VELOGRAPH, SHOWING THE INTERIOR.

tion, of 296 Broadway, New York. Total distance covered, speed at every portion of the journey, and all stops are permanently recorded on a circular disc in the instrument, thus giving a complete record of the movements of the vehicle, which is especially valuable for commercial automobiles. The Velograph is wound up like a clock at the commencement of the day's work. A circular disc divided into hours and minutes is driven by the clockwork, while a pointer carrying a pencil and operated by a flexible cable from a road wheel makes a continuous record around the outside edge of the disc. Simultaneously with the up-and-down movement of the pointer, the disc revolves around its center, a zig-zag line being traced, the more acute the angle of the zig-zag the quicker the speed, and vice versa. The instrument is used very extensively in Germany by the postal authorities and important business houses.

THE AUTOMOBILE

Autoing Through the Island of Sugar and Tobacco

HAVANA, CUBA, Feb. 1. —Silhouetted against a dark, clear sky like stately sentries, a hundred palm trees framed such a picture as inland Cuba has never seen. Close by a trickling stream at the bottom of a stony valley, a huge flaring fire of palm leaves cast theatrical lights on a quintet that was viewed with much wonder by two Cubans on horseback and a barefooted native who stood in awed silence before the group. In the deep gloom under a cluster of palms stood the big black thing in which they had come—an automobile. It was wonderful. Automobiles they knew the great Americanos had to skip over country where there were roads. Here there was no road. This route through the hills was but a path for horses and that rock-strewn ascent—surely the big automobile could not go up such a hill. The Americans laughed and asked about the country and its trails. The dark-visaged doctor and his servant answered in that rapid fire of Spanish which makes a Cuban conversation like the popping of a Hotchkiss. But neither the exuberant Spanish tongue, nor the skillful interpreter was able to express the full measure of Cuba's surprise at such a vehicle in such a country.

It was the adventurers' first night under the star-brilliant skies of Cuba. That afternoon they had gayly skipped out of Havana, leaving behind a wholesale stock of pessimistic warnings. At garage, hotel, store, restaurant—every Cuban and every American had said: "Impossible; it

can't be done. Why, there are no roads at all in the interior. You will not get twenty-five miles away from Havana. You had better stick to the delightful speeding on the San Cristobal road, like the orthodox tourists who yearly come here."

Perhaps the wide and glorious fame of the San Cristobal road had brought these Americans

southward via the False Impression Air Line. But now that they were here, they would go into the back yard of Cuba whether or no, roads or no roads. Thus when the first day's sun sank behind a palm-fringed screen and, without even a twilight overture, the whole big night filled the stage four Americans and a leased Spanish Voice gnawed hungrily at the Cuban-cooked guinea hen which had been bought of the barefooted farmer, while they talked with the strange doctor who rode abroad at night in a wide, wild country.

"Is this the road for Matanzas?" queried an American.

"Este es el camino para Matanzas?" echoed the interpreter. And the answer started with "Si, Señor," but ended with something that sounded like a nickel-in-the-slot piano and

meant that it was about 45 leagues to Matanzas; that we could have gone another way; that the road was nothing but a series of stone-stepped hills and ragged ravines; that the next town, about a league and a half away, was called Jaruco; why had we ventured such a hazardous and altogether impossible journey; who were we, and from where did we come?

To the best of our knowledge the conversa-

GETTING ROAD DIRECTIONS FROM TYPICAL CUBAN FARM FOLK

tional transfer told the attentive audience that we hailed from Detroit; that the longest one, with the khaki suit, was S. D. Waldon, sales manager of the Packard Motor Car Co.; the other being Senors George, Crebbin, and Estep; that the automobile was a Packard, and that we intended to stay a week or more touring in the interior of Cuba. At least he talked enough to have told all this and then a little.

Thirty Miles the First Day.

That first day we had made thirty miles between 2 o'clock, when we pulled away from the Pasaje Hotel, and when darkness caught us at the spot we named Camp Jaruco because it had never been properly christened. It had been a hard afternoon's drive, and in a degree the evil forebodings of the Havana skeptics had been realized.

We left Havana down an aisle of palms, floored with velvet macadam and sentineled with an occasional block house which added romance to the picture of low huts dotting the rolling hills. The macadam terminated soon in a stretch of freshly graded but uneven road where a new state highway is being built. This gradually went from bad to worse until it reached the ordinary and typical Cuban trail which has never felt a roadmaker's hand. Six or seven leagues out of Havana we seemed to be in the midst of an elementary country and it was easy to imagine all manner of hardship as companion woes to the steep hills and rough ditch-like trails that formed the only route we could find. We discovered that the rough fields were often better than the trail. So we climbed a couple of hills over plowed ground and then all but jumped down a near precipice to Camp Jaruco. There was little sleep that night. We made a bed of palm leaves and brush on the ground, but it was not a good bed. The night proved chilly. We tried all places and positions, and then, in the main, devoted the silent, rather awe-inspiring hours to gathering palm bark and other fuel for the fire.

We commenced the second day on a frugal breakfast of tea and crackers and a hill-climb through a field to a peak where a farmer had a hut which overlooked so much of Cuba that we shut our eyes to the prospect. It was on this day that we began learning Cuba in earnest. We met strange things at close range. After having toiled laboriously and precariously over some rocky ridge or crept along a ravine where the one wheel would have to bump from rock to rock and the other follow a sloping ledge, we would strike a brand new fantastic setting, laugh at its quaint and innocent actors, blush at its deshabelle, kill a scorpion or two, go splash, dash through a minor ford, or stop for a moment at some hut with the inevitable:

"Oiga, chico! Este es el camino?"

We lunched at Jaruco with the whole town as audience, which retired with a yell to box seats in their respective windows when we started the motor and rushed on. For an eighth of a mile we "beat it," and remembered the Glidden tour. Then we pitched off into the middle of Cuba and for the afternoon were again lost in a land of beautiful flowers and majestic trees; red clay soil which has been out deep with the long-worn ruts of giant ox carts; ruins that seem yet to smolder with the fire that Weyler lighted; stones which carpet the earth so thickly that the only way around them is over them. Once the road dropped into a trough in the red earth. Just wide enough to let us through, it was like riding down some winding flume, not knowing whither, because the grass on the banks reached high above us. Often we found the only passage to be along the wriggling fences, and with hatchet and machete we cut down the underbrush to clear a trail we could follow.

Cuba's Roads Are Varied and Doubtful.

There is no continuation of any kind of road in a day's travel through Cuba. The face of the country changes rapidly and the character of the route in still greater proportion. There are no four-wheeled vehicles of any kind. We were

REPAIRING A PUNCTURE ON SANTA CLARA TRAIL

PACKARD CLIMBING HILL IN HAVANA PROVINCE

TYPICAL FORD IN SANTA CLARA PROVINCE.

TAKING A HACK AT THE ROAD AHEAD.

in a land where the only hauling is by ox carts whose wheels are from seven to ten feet high and which are dragged by from three to five yoke of thick-shouldered, powerful oxen and bulls. The clearance of these carts is always more than forty inches. When the ground is soft they simply plow it into straggling furrows from two to four feet deep. The only other travel is by horse. Water, food, vegetables, fruits—everything except the sugar cane and the logs goes about on the backs of ponies or pack mules.

A comparatively level path across the red soil may, in a quarter of a mile, abruptly end in a valley which is nothing but a mass of huge boulders; it may lead to a score of mud holes or to a long stretch where the ruts have been cut so deep and so numerous that they will never be erased and where there is only one course—to jump around on the ridges in a restraining, nerve-racking, wheel-twisting, tire-abusing effort to avoid dropping into any of them. Then, again, a few miles will bring you to a country where the road is marked by long rows of palms set by early Spaniards but between which there is nothing except an endless river of rank grass, hiding stones, stones, stones.

That second day we began to get into the region of rivers and went through a rehearsal of the great continuous show of succeeding days, the act of wading into a river to find out where might be a safe path for fording it. We were glad to end the day, with 34 miles gained, at a farm-house hut with a few square feet of grocery store in one corner. We ate the typical country meal, garlic-flavored, greasy and made up of eggs, chicken and rice, tomatoes, fried potatoes, and bread. We added tea. Coffee in Cuba is "solo," which means so black that one must be in good training to drink it; or "con leche," which means about half-and-half with warm Cuban milk, which is not the kind of milk a foreigner is used to. We slept on cots in a well-ventilated corner of the house—at least we stayed on the cots, while we listened to queer night noises, fought fleas and discussed this peculiar "land of Manana," where nothing is done to-day and where a lot of things that ought to be done probably never will be done.

Where There Was No Bridge.

At daylight we swallowed some coffee and struck off on the nine-mile stretch to Matanzas. We met a section of State road in process of construction, and mounted its rough stone but level surface only to reach, in a few hundred yards, a wide chasm where the bridge had not yet been built and the river flowed between banks a hundred feet deep. This is a bad habit of Cuban rivers. They can be forded by carefully selecting a course over ridges in the solid rock which forms their bed. It is a harder task to reach them. The only way down the precipitous

IN THE SPOT LIGHT AT JARUCO, BEING EXAMINED BY THE CURIOUS.

bank is through some ravine or washout. This invariably is a crooked path of rock with steep drops and actual steps three and four feet high. Sometimes a crooked, lengthwise rut, worn by years of horse travel and by ox carts which have been hauled up the path, made it necessary to run the car down with the wheels on the almost vertical walls of the rut. Often we were forced to take the mattock and cut a slender shelf for several yards along such a wall, in order to give the car even the slightest footing. Once at the bottom, there is the strip-and-wade-into-the-river act to determine the proper place to cross; the ford itself, with a rubber coat over the radiator to keep water out of the bonnet, and then the climb up a ravine that matches the one by which the descent was made.

We stopped a few hours in Matanzas to buy some groceries, search for gasoline and add to our supply of road-making implements. We also changed interpreters, and this time got one Geerken, clerk of the Hotel Paris, whom we called Roe and who turned out to be not only capable and willing but comedian enough to help turn many a deep mud hole or turbulent river into a joke.

Eastward the Star of Hope took its way in a Packard car, over a new good road which stopped after nine miles so

ENTERING A FARMYARD, WHICH MEANT SUPPER AND A PLACE TO SLEEP.

CENTRAL CUBA ABOUNDS WITH GAME.

suddenly in a natural stone quarry that we once more adopted across-lot tactics. A river which had been described as fifteen feet deep turned out to be almost dry and we hardly missed the bridge which had once been there but which the Spanish army had destroyed while industriously engaged in keeping a big bunch of machete slingers from following. Towns were thick along here, and we much enjoyed coming out of a hard fight against ruts and stones into a level area where from the collection of houses there invariably streamed a horde of young and grown-up children whose eyes popped out, whose tongues could hardly answer our "Que hay!" and whose feet finally pattered rapidly on the stone as they chased us up the road to prolong the final view of this new American invasion. We had a lot of trouble convincing the natives that we did not belong to the United States army. What else but that great, all-powerful United States army could have such a vehicle wherewith to travel over such trails as those of Cuba? Our day netted 44 miles, which was pretty good considering our four-hour wait in Matanzas. We ate under the flickering flame of an acetylene lamp in the main room of a farmhouse called Tosca. In rural Cuba the poor use candles or simple kerosene lamps, but the more pretentious have acetylene, manufactured in a small generator kept outside the house.

Into Heart of Sugar Cane Region.

Now we were getting into the heart of the sugar cane region and our fourth day earned us 60 miles, some of the going being pretty good. Ruts we encountered by the mile for there was much hauling of sugar cane hereabouts. Also more stones and rivers and those long stretches where there is no road, and we simply picked a way to our taste across the stone-strewn, grass-covered hills and flat lands. Everywhere ruins to remind of the war, and in the towns "Vive la

AMERICAN NATIONAL GAME IN CENTRAL CUBA.

"QUE HAY DE NUEVO, SENORITA!"

libre Cuba" signs calcimined on the sides of the houses. The fighting had evidently been the real thing in this neighborhood. In fact the rural guard who sold us a machete said he had killed seven Spaniards with it.

We stopped at an immense sugar mill to get a glimpse of its inner workings, and a drink of water which was brought to us in a "porron." This is a bottle which you must not touch with your lips but must hold several inches away and try to hit your mouth with the stream of water.

Macagua was an interesting night rest. The whole countryside had come to town, for it was Sunday and there had been a ball game between local teams; also there was a dance in the hotel office that evening and we attended this in full dress—flannel shirts, khaki knee trousers, leggings, mud and four days' growth of beard. It was not much fun, so we went outside and showed a lot of fussing, jabbering town celebrities how to send up a big colored paper balloon.

Into Hillier and Wilder Country.

For five more days we went on into the hillier and wilder country. Monday was our record day—63 miles. Most of these were made through an immense flat country which was either swamp, out of which grew grass higher than the car and which hid wet and hard ground and stones alike, or it was a high plateau, where there was not a thing in sight but royal palms, scattered clumps of shrubbery and ponds. Here the surface was fairly hard, although to a northern road-trained eye it would have looked rough and arduous of travel. We got over it fairly well until we lost our way and only found populated country by cutting to the railway track, which we knew to be to the south of us, and then by following along its right of way to the next town. Some time when you are riding on a train, look for a place where the right

JAI ALAI—THE CUBAN NATIONAL GAME

TOURING IN TENNESSEE, ALABAMA, AND GEORGIA

By PATHFINDER.

ONCE leaving Nashville, the route which we have followed in our White steamer is practically the same as that taken by the armies during the Civil War as the Union forces slowly but surely advanced into the territory of the Confederacy and swept the Southern troops before them. This is not a coincidence, for I deliberately planned our route after consulting the Civil War histories. There are no road maps covering this section of the country, and I could think of no better way of finding out the lines of least natural resistance, and, therefore, the probable location of the best roads, than to search into the records of the war.

Before leaving Nashville, we visited several points of interest about the city, including the tomb of President Polk and the famous "Hermitage," the old home of Andrew Jackson. The latter is located about twelve miles from the city on what is known as the Lebanon Pike. The afternoon was half over when we finally started on our way and we had an easy three hours' ride through Murfreesboro to Shelbyville (57 miles from Nashville), where we spent the night. Nashville is in Davidson County, and the roads in that county are free, but thereafter there were toll gates at frequent intervals, and we paid all told \$1.95 between Nashville and the Alabama boundary.

At Murfreesboro we saw what is left of the fortifications which were erected at the time of the famous two-day battle, and at Shelbyville were other sights to revive war memories, as it was here that the Confederate army spent the winter after their defeat at Murfreesboro.

At Shelbyville we could have turned southeastward and made Chattanooga in probably one day's ride, but I preferred to go southward into Alabama, following the lines of the military operations. The toll road continued south from Shelbyville through Fayetteville and almost to the State line. And here I would like to offer a word of warning to those tourists who may follow this route. The toll gates are kept down and are not raised until the toll has been paid. This procedure is all very well—provided you see the gate. We were bowling along toward Fayetteville at a good rate of speed when suddenly we saw a toll gate blocking the road only a few yards in front of us. I jammed on the brakes with every ounce of strength I could muster and brought my car to rest with scarcely a foot to spare. The gate was an unpainted affair of almost the same color as the road, and it is no wonder that none of us saw it until we were right upon it. I remonstrated angrily with the

gate keeper. "It is the orders to keep the gate down," he explained. "But surely you hang a lantern at night?" I asked. "No sir," he replied, "never had any order to do so." It was then that I began to realize a general truth which was more and more impressed upon me as we advanced, namely, that in this section of the country, as

A PAUSE ON THE SUMMIT OF ORCHARD KNOB NEAR CHATTANOOGA.

regards the maintenance and condition of the highways, the traveling of motor cars over them has not received any consideration whatever. The conditions are adapted to horse-drawn vehicles—and that is all.

A Century from Nashville to Alabama Line.

It is almost exactly 100 miles from Nashville to the Alabama line. This section is distinctly Southern. The "Soldiers' Monument" in each town is invariably a Confederate memorial. On this part of our journey we had our first glimpse of the cotton fields and realized we had arrived in Dixie.

GEORGIA PICKANINNIES GROUPED ABOUT THE WHITE STEAMER.

ALABAMA COTTON GIN WITH WATER POWER.

From the State line we had 18 miles of fair road to Huntsville, Ala. Here we turned east and soon had the pleasant sensation of crossing two considerable ridges on a road without water breaks. After leaving the town of Gurlie, we crossed what could fairly be called a mountain, for the first time since leaving Pennsylvania. The road over the mountain was only partially completed and was so mushy that we used almost as much power going down as we had going up. What was our surprise, therefore, to turn from this road abruptly into a stretch of perfect macadam. We had come into Jackson County, Ala., and soon we learned not to be surprised at anything within its borders. Never have I seen such contrasts between good roads and bad roads as we saw in Jackson County. Possibly 75 per cent. of the going was over fine pikes and the other 25 per cent. was over roads which are apparently absolutely neglected.

We spent that night at Woodville, a little hamlet 150 miles from Nashville, having covered 93 miles for the day. There was more rain that night and the next day we struck many soft places where the only thing to do was to get brush and stone to put in the path of the wheels. Interspersed with roads of this kind were occasional stretches of fine pike, with here and there a road made up mostly of loose stone where we found that we needed every bit of the unusually liberal clearance which distinguishes the White steamer. The distance covered that day, to our night stopping place at Bridgeport, amounted to only 58 miles; from which it is evident that Jackson County, Ala., is not an ideal touring section at this time of year. We were told, however, that in summer the roads are in very good condition.

Leaving Bridgeport the next morning we had very good roads to Jasper, and here we found the person we had been seeking for two days, namely, an individual who was able

FORDING THE SHALLOW SEQUATCHIE RIVER.

to tell us how to get into Chattanooga. Here let me point out that we have had the hardest time in getting road information ever since leaving Nashville. At that city even John T. Landis, who has driven his car from Nashville to Quebec, confessed that he had never been to Chattanooga and he did not know of any one who had. When such a veteran tourist could give us no information, imagine how much we could learn from the farmers along the road. Please keep in mind that Chattanooga is not an easy place to reach by automobile. Nature seemed to have tried to shut off Chattanooga from the outside world and Man has done but little to thwart her purpose—at least from the autoist's point of view. Chattanooga is located in a little valley from which mountains rise on every side. As if this was not sufficient isolation the Tennessee River twists and bends about the city, seeming to press it back against the mountains. Therefore, two problems had been before us ever since leaving Nashville, where we could cross the mountains and where we could cross the river. Our historical guides failed us completely, as the army had, at will, taken to the railroad right of way or had been carried on the river in boats. We were, therefore, highly pleased when we chanced to meet at Jasper a gentleman who owns a White car and who gave us the desired information.

Acting in accordance with his directions, we turned toward the Tennessee River and headed for Rankin's Ferry. Here we were taken across in a flat-bottom boat, propelled by oars, and, on the other side, we had a fine little job of road building to make our way up the muddy incline which, but two days before, had been part of the river bottom. What good did it do for us to suggest to the ferryman that he dump a little stone into this quagmire? As I said before, the peculiar necessities of the automobile have not entered into the calculations of the people in this section.

From the ferry we had seven miles of rather rough going, crossing in the meantime Raccoon Mountain. On our way up the mountain we several times forded a mountain stream and the fording places looked as if they might be deep at certain seasons. On the far side of the mountain we struck a good pike, which led us into Chattanooga, 247 miles from Nashville by our indirect route.

Before reaching the city this pike leads along the side of Lookout Mountain. If one should slip over the side of the road he would land in the Tennessee River, several hundred feet below. If it were not for this feature I might venture to suggest Lookout Mountain as a suitable place for a great hill climb. We arrived in Chattanooga in time for lunch and had a half day in which to look over the city. The next morning we resumed our journey southward. A boulevard leads from the center of the city to Missionary Ridge, where commences a fine stretch of government road.

From Lafayette and on through Summerville we found the road fair to poor. The soil is composed of reddish clay and sand which washes out freely and leaves the road full of ruts and holes. Yet we had good solid ground under our wheels and made good progress to Rome, 75 miles from Atlanta, and here spent the night.

The next day it rained continuously, and we had an opportunity to see what a fine slippery mixture the Georgia clay can make. Although it was hard work keeping the car in the center of the road, we found that there was considerable bottom to the road.

The 400 miles between Nashville and Atlanta have been by far the worst we have yet covered. The heaviness of the road, however, has been due entirely to the abnormally heavy rains, and I have no reason to believe that the tourist who has made his way as far as Nashville will find the journey from there to Atlanta particularly severe at a more propitious time of the year.

SEVENTEEN MILES OUT OF DAYTONA ROAD IS EXCELLENT.

CROSSING ONE OF THOMAS WHITE'S TRESTLES.

FLORIDA COAST ROUTE EXPLORED.

Though the Cleveland pathfinder, which has just accomplished the run from Jacksonville to Miami, has made no attempt to remove mountains or to make the difficult path plain, it has done sufficient useful work for the main body of tourists to appreciate its pioneer trip. There are enough natural difficulties on this run of 371.8 miles down the Florida coast without calling upon the participants to add to their difficulties by picking out a trail where automobile had never before penetrated. The coast run is possible, but only on condition that the automobile attempting it is of robust construction and handled with skill and intelligence.

James Laughlin, 3d, who drove the Cleveland 40-horsepower Pathfinder, reached Miami one day ahead of schedule, notwithstanding the breakage of a front spring between St. Augustine and Ormond. Tire trouble was *nil*, the Continentals employed being as good at the end of the trip as at the commencement. It was necessary, however, to take advantage of every bit of daylight for driving and to work on several occasions late into the night to prepare the car for the arduous trip of the morrow.

In the pathfinding trip the hardest day's work was from Grant to Jupiter, a distance of nearly one hundred miles. Grant, a city of one house and an hotel, was reached late at night from New Smyrna. Arrangements were made with some fishermen to ferry the car across the river Sebastian, where a guide was to be picked up. In the seven miles of deep woods leading to the ferry the party became lost at 2 o'clock in the morning and ran around for two hours trying to discover an outlet. A house was finally found and a guide secured. After being ferried over the river by hand power, a second guide was secured at Vero, and after plowing through 20 miles of sand, reached Fort Pierce.

Reuben Carlton, an old-time cow puncher, here plunged the party into the deep woods in search of the Capron trail. For thirty miles the going was through a roadless country spotted with roots which frequently had to be cut away, with long wiry grass reaching up to the radiator, and swamp patches that occasionally caressed the hubs. The bridge had been washed away from one stream and it was necessary to construct a ford by digging away eight-foot banks at either side. When the car finally lunged down the steep side the angle was so steep that the driver only was able to maintain his seat. A twenty-five-mile trail through the pine wood followed, then there was a plunge into a swamp road, which called for the travelers to step out into a mocassin snake den. After more bridge building and the hacking away of stumps, Jupiter was reached at a late hour. The terrestrial city's accommodation was found to be limited to three visitors at a time. As there were five in the party two had to turn in for the night under a tent by the side of the car.

Now and again a spot would be come across where a speed of 20 to 30 miles an hour was attainable with ease. As such spots were generally through beautiful orange groves and pineapple fields, and to the accompaniment of sweet singing birds and the drone of winged insects, the 30-mile limit was quite sufficient.

There are now signposts the entire distance from Jacksonville to Miami, marking the route to be followed by the tourists, who will leave the former city on February 18. Those already entered for the run comprise a couple of Maxwell cars, two Cadillacs, two Clevelands, an Elmore, a Ford, and a Winton. There is no restriction as to horsepower or equipment, all cars being available on an equal basis, and an interesting trip is confidently expected.

BETWEEN ST AUGUSTINE AND ORMOND—MAKING A FORD.

REMOVING A STUMP THAT BLOCKED THE WAY.

HOW THE MOTOBLOC HAS BEEN FITTED FOR RUN FROM NEW YORK TO PARIS.

FEATURES OF FRENCHMEN FOR WORLD TOUR.

PARIS, Jan. 27.—Though all are destined for the same struggle, there is a wide diversity in structural features and methods of equipment of the four French cars which will be embarked on the *Lorraine* for New York February 1.

One of the first cars to be ready was the 40-horsepower Motobloc, built in Bordeaux. Structural features are a 40-horsepower, four-cylinder engine with flywheel between the two pairs of cylinders, motor, clutch and transmission forming one block—hence the name. Chain drive is employed. Except for the frame being lined with soft wood, the chassis follows standard lines of construction. Pneumatic tires have been abandoned in favor of a special type of cushion tire with individual air chambers. The body is practically a four-seated runabout, the rear seats being brought sufficiently forward to allow of a large chest being built at the rear for storing provisions and carrying parts. A rack above the chest allows for loose cases being carried. In the demonstration about town champagne cases occupied this position. Running boards are wide and fitted with trunks; searchlights are over the fore end of the mudguards; the body is covered with a folding hood, and driver and mechanic are further protected by a short leather wind shield. Patriotically the bonnet has been painted with the national colors; commercially the body bears the name of its maker, the car of its constructor, the trunks of the supplyman and the wine basket the name of a well-known brand. Godard, who will handle the car, drove the Spyker from Pekin into Russia, where he had to abandon with magneto troubles.

De Dion has selected a standard 40-horsepower model, strengthened in every feature, filled the frame with soft wood, and wrapped it with felt and insulating cloth to protect it from the cold. In the lower part of the specially designed body provision has been made for 260 gallons of gasoline. Above the tanks are commodious lockers for carrying supplies, and above this the seats, the whole being protected by a cape hood with side cur-

tains, making an entirely closed-in car with provision for sleeping. A mast is stepped forward, the intention of the driver being to use a sail in journeys over the ice. Before the driver is a compass, a sextant, and a roll map of the country to be traversed. A small electric motor will provide light at night. Collignon and Cormier, who went through the Pekin-Paris run, have personally supervised the fitting out of the car. Hans Hendrik Hansen, the explorer, will be the driver. No expense has been spared in fitting out, and De Dion is a decided favorite among the foreign starters.

Sizaire & Naudin, being builders of a light low-powered car, have stuck to their standard chassis for the race, the vehicle being a 12-horsepower, four-cylinder car. Paul Pons, who started from Pekin on a Contal tricar, has been chosen as driver of the little car.

Little has been learned about the Werner, which M. Lelouvier, said to be the originator of the tour, will drive from New York. It is in the motorcycle and small car field that the firm has earned its popularity, and it is rather surprising, therefore, to find that a 40-horsepower engine is being used. Officials and organizers, including the *Matin* editor, will travel with the contestants to New York.

AEROPLANE'S FIRST FLIGHT ENDS BADLY.

PARIS, Feb. 3.—After flying 65 yards at Bagatelle, M. Delagrangé procured a new aeroplane, almost a duplicate of the one used by Farman, and met with disaster on the Issy ground. When traveling at a rapid rate one of the propeller blades snapped off, breaking the crankshaft and cracking the crankcase. The power plant had been especially well studied, the eight-cylinder Antoinette motor being of the latest model and equipped with a tubular radiator carried in a forward portion of the frame. The forward equalizers were a feature not tried before on aeroplanes built by the Voisin Brothers. No reason can be discovered for the breakage of the propeller, the material apparently being perfect. It is expected that further trials will commence in a week.

DELAGRANGE AEROPLANE, WITH EIGHT-CYLINDER ENGINE AND RADIATOR FORWARD.

SOME OF THE VENTURI TUBE PECULIARITIES

By E. A. HUENE.

THE increasing use of some form of Venturi tube carbureter shows either a revulsion in favor of simplicity at any cost or the recognition of some element in this type which in practice accomplishes the best results achieved by other forms using some system of supplemental air orifice, or oil retardation at the nozzle. Nevertheless, a review of late contributions by various engineers upon the Venturi type fails to disclose harmony, either as to what it accomplishes or as to scientific reasons for its conduct in practice. From a late article by David Landau on "Carbureter Design

FIG. 1.—Showing point of depression.

with Reference to the Venturi Type," it may clearly be deduced, if not actually expressed, that it does not produce the necessary compensation between air and oil by reason of its inherent arrangement: Not being within the province of this article to question premises when the conclusions arrived at are indisputable, it is sufficient here to state Mr. Landau's conclusions: "The velocity of discharge in the various sections is inversely proportional to the area of the sections. Hence it is evident. . . that the pressure is. . . least in the smallest." With this simple explanation, we arrive at the real fact, which he sets forth thus: "When a pressure gauge is placed at *a* (Fig. 1) the pressure is found to be less than atmosphere; in fact, the fluid is discharged into a partial vacuum." After much valuable formulæ and deduction the practical conclusions arrived at are that, as to mixture, the Venturi possesses these advantages: "Homogeneity of mixture. . . reduction of wire drawing. . . and facility in starting."

Upon the other hand the several makers of this type for the market value it apparently as accomplishing air and oil compensation, without the complication of the supplemental air type. This view is specifically set forth as follows by F. E. Watts in his recent contribution to a contemporary on "Carbureter Requirements in Two and Four-Cycle Engines," where he says: "It is claimed with certain forms of converging air nozzles, like two hollow truncated cones with their small ends brought together, there is a point where the suction remains practically constant whatever the velocity of air flow. If the fuel nozzle is located at this point we shall, of course, have a constant mixture at all speeds."

If the results obtained with the Venturi type were in all ways equally good as those from the well designed supplemental air type at its best, it would not be worth while from any but an academic standpoint to discuss the reasons for such conduct. But it has already appeared, with but a small part of the authorities quoted, that this is still debatable ground. Consequently it seems desirable to further analyze the actions of this type and consider the laws of physics which govern them.

Take for a starting point the gauge demonstration that there exists a space, or volume of low pressure, at some point in the throat of the Venturi tube. The shape and boundary lines, even if well defined and constant, which they probably are not, are not subject to exact calculation, nor to very close observation, though the latter may be

had in a rough way by constructing a tube Venturi with flat, parallel glass sides, as in Fig. 2. Upon blowing smoke through this tube, the form of low pressure space can be observed in two dimensions, as the smoke, in spite of its tendency to follow the flat glass sides to some extent, still leaves a low pressure area thereon. This area may be considered, then, as a section cut through the center of a true Venturi tube longitudinally.

Having demonstrated that it exists, the next inquiry is as to the laws governing it, after which may be discussed the effect on the oil flow. Mr. Landau determines the matter from the following laws: "Equal quantities of air pass given points of varying section in the same time," wherefore "the velocity of the air in the various sections is inversely proportional to the sectional areas." Hence his conclusion that the pressure is greatest at the largest section and least at the smallest section, the throat. There seems some doubt, however, whether these laws fully apply to the phenomena observed, as there are some other laws governing the flow of gas and air along surfaces which, though less important in general, have much, if not complete, control of the action of the Venturi tube.

The original Venturi experiment consisted of emptying a reservoir of water by means of driving a stream of water up a gently inclined plane from the level of the stream to the edge of the reservoir. Later experiments determined that a stream of air through air or through water produced like action. Many simple experiments show this action, such as the flame of a candle bending toward a stream passed close by it, or the action of a curved vane pivoted at its center with a stream directed tangentially along one surface, when it moves toward the stream and may be made to revolve in that direction by advancing the stream; when a stream of air is blown through the bottom of a hemispherical cup in which a light sphere is lying, by the inability to dislodge the sphere which, if inverted, resists gravity. In a similar manner a light sphere may be suspended in a flowing jet of air or liquid. These phenomena are generally designated in physics as the pneumatic paradox. It is apparent that upstream surface pressure is diminished by reason of the radial streams until down stream surface pressure predominates. To more clearly understand this statement take the experiment of the hemispherical cup, Fig. 3.

Let *ab* represent the hemisphere and adjoined upstream tube, *c* the sphere and *de*, *d'e'* the radial streams. It is quite evident that friction, or adhesion, which was considered

FIG. 2.—Illustrating the anomalous action of the Venturi tube.

the reason of the original Venturi phenomena, cannot here apply, as its assumption would work a quicker discharge instead of retention of sphere *c*. Nor has the presence of the hemisphere *ab* any bearing on the phenomena, as the sphere suspended in a free air jet demonstrates. Directly applied to the carbureter there will be found little in the above experiments and laws applicable, the nearest approach, probably, being that the same well known laws that do here apply solve the phenomena of the sphere, Fig. 1 and kindred. The law of centrifugal force needs no exposition, there-

fore it is only necessary to state one other law, or proposition, to wit: A moving fluid tends, on account of adhesion, to follow a surface, where the velocity of the fluid and the curvature of the surface are not too great.

Referring back it will be observed that Fig. 2, which for the moment may be considered the Venturi tube of common carbureter design, is but a modification of the hemisphere of Fig. 3, minus the contained sphere, which sphere is in the latter experiment surprisingly approached in form and location by the low pressure or vacuum space of Fig. 2.

The curvature of the air stream beginning at the throat is, then, caused first by the adhesion to, and consequent following of, the diverging wall surfaces. The centrifugal force tending to resist this turning once having been overcome, adds its effect in enlarging the inner, low - pressure space. Consider the

FIG. 3.—Experiment of the hemispherical cup.

oil nozzle inserted into this space of low pressure at the throat and the conditions are complete for study of the effect of carburation. Upon induction stroke of the motor the air in the tube assumes the position shown in Fig. 2; into the low-pressure space oil from the nozzle readily expands in a finely divided state and is readily taken up by frictional contact and affinity between it and the inner surface of the surrounding shell of passing air.

Some general observations in conclusion, deduced from the matters set forth, are: That the assumption that the Venturi tube carbureter has a compensating action which neutralizes the tendency of overrichness of gas at high speed is not well founded; that it may, nevertheless, well give very good results in practice up to a certain speed for a given throat angle design on account of the homogeneity of its mixture, which is largely promoted by the location, shape and uniform expansion of its low-pressure space in action. Its limitations in furnishing a well commingled charge of gas are readily seen to be at the point where, with given throat angle and given speed, the surface tension of air following carbureter walls is overcome by its tangential centrifugal force tending to pass the air by nozzle in a circular column of constant diameter instead of as a hollow oval of varying length.

Some suggested improvements in this type are: A deflector of such form at the throat as to positively establish and maintain the radial streams around nozzle; "rifling" the throat for the same purpose, thus inducing a vortex, or whirlpool beginning at nozzle and extending downstream. By the use of a proper throat angle in this connection a low pressure space may be induced which will not contract in diameter at any induction speed, but will uniformly expand downstream. It is quite possible that this construction may promote good mixture to such an extent at all motor speeds as to leave little necessity for supplemental air compensation. If such compensation is deemed desirable, a direct vacuum oil balance is possible.

GAS POWER SECTION A. S. M. E. MEETING.

The first meeting of the Gas Power Section of the American Society of Mechanical Engineers will be held on Tuesday evening, February 11, in the Engineering Societies Building at 29 West Thirty-ninth street, New York. The subjects discussed will be varied and interesting.

PARIS 1908 SALON TO BE RUN ECONOMICALLY.

PARIS, Jan. 27.—Parisians will not be deprived of their annual display of automobiles in the luxurious palace in the Champs-Élysées, the Chambre Syndicale de l'Automobile having decided in principle to hold an eleventh annual exhibition next December. Soon after the tenth annual show turned out its thousand of electric lights the question of the advisability of holding the Salon every two years, instead of annually, was brought up for consideration. It was understood that if this were done some arrangement should be arrived at with the promoters of the rival show in London, by which the British event should also be held at intervals of two years only. Apparently no such entente was possible, and the Grand Palais will see an eleventh annual automobile exhibition before the end of the year.

The lavish expenditure which marked the tenth annual show will not be a feature of the coming event, the manufacturers' committee having decided to recommend its members to adopt a more modest type of ornamentation. The central committee, however, will maintain the same decorative display for the interior and exterior of the hall. After expenses have been met a certain part of the profits will be distributed among the exhibitors. Free entries will be considerably limited, those given being made strictly personal, either by the use of photographs on the cards or other means. Of late years free passes have been so extended by the promoters that crowding of the hall by non-purchasers has resulted.

WIRELESS TELEGRAPHY AN AUTO EQUIPMENT.

PARIS, Jan. 27.—Marconi has been taken into the automobile fold. The first application of wireless telegraphy to the most modern of methods of travel was seen at the recent Brussels exhibition, where a Pipe limousine was fitted with Marconi's transmitter and receiver. The tall mast above the roof of the limousine would doubtless be found a considerable inconvenience in touring, where overhead bridges and other obstructions are met, and there is little probability of the arrangement becoming a standard equipment on touring cars. It is stated that the automobile wireless telegraph station has been used extensively in army operations and found to be eminently satisfactory. In comparison, even the ordinary field telegraph service was vastly inferior for transmitting orders.

FIRST "WIRELESS" STATION FITTED TO AN AUTOMOBILE.

A GASOLINE METER FOR AUTOMOBILE USE*

UTILITARIAN ideas in connection with the automobile do not appear to be fertile, judging by the experience of the Association Générale Automobile, a French body which desired to develop the best apparatus for abolishing smoky exhausts, for preventing light-fingered gentry from borrowing an automobile without going through the formality of asking the owner's permission, a device to enable drivers to hear sounds in the rear of the car, to see what is passing behind the vehicle and to measure the exact amount of gasoline consumed. Schemes are plentiful, but few of them had the merit of being sufficiently practical to warrant a reward. Among the exceptions were a "Flic automobile" to prevent a car being stolen, and a gasoline meter designed by Chauvin & Arnoux.

There is a sufficiency of machines on the market for measuring liquid for the problem to appear, at first sight, a simple one. Closer examination soon shows that there is little in common between an instrument for measuring water, gas or electricity and one to be used on an automobile to indicate the amount of gasoline consumed by the engine.

FIG. 1.—Sketch showing principle on which the gasoline meter operates. Gasoline arrives at U, is driven under pressure by the piston J into Cylinder T, and travels to carbureter through valve S and piping V. By rack and pinion M the number of liters is registered at O; number of revolutions of the crankshaft are registered at G.

The driver of a car is lord and master of every bit of mechanism about it, and although, in his case, the object is not to make the indicator show as little, but as much as possible, he could soon accomplish his ends if special pains had not been taken to thwart him. For instance, with an indicator fixed somewhere on the piping, between the gasoline tank and the carbureter, all that would be required would be to disconnect the piping at the carbureter, turn the pipe into a can and pass through as much gasoline as was considered necessary. In such a way the car would consume ten, fifteen, or twenty gallons in a very short space of time, every drop of which would have been registered without the motor making a revolution.

In the Chauvin & Arnoux instrument this has been guarded against by making the flow of gasoline impossible except when the motor is running. Thus, supposing a 30-horse-power machine consuming two gallons of gasoline per hour at 1,600 revolutions a minute, the chauffeur would be obliged to turn his engine over at 400 revolutions for four hours in order to gain two gallons. Any man who would undertake this would certainly be entitled to the fuel he obtained.

Principle on Which Gasoline Meter Is Based.

The principle of the apparatus is simple. A Pulley A (Fig. 1) is connected to the motor by a belt, the gearing being such that for one hundred revolutions of the motor shaft the pulley makes one complete turn. Thus, whenever the motor

*Translated from *Omnia*, by W. F. Bradley.

has made one hundred revolutions, the cam C, attached to the shaft of the pulley A, will have made one. With each revolution of the cam the arm D (Fig. 1) is driven to the right; as the arm is keyed to the connecting rod H, this and the piston are operated by the same cam. If the arm D is in contact with the cam the maximum movement will be obtained; if the two are separated, the movement will be in proportion to the distance between them.

It will be thus seen that the function of the cam C is to drive the piston from left to right, while the function of the spring I is to bring about an opposing movement. Supposing the apparatus to be full of gasoline, it will be readily understood that the cam, by driving the piston to the right, will aspire gasoline into T, under the leather-faced lips of the piston, while the spring I will drive the same liquid through the valve S to the engine.

The amount of gasoline contained in T should, in consequence, be sufficient to meet the wants of the motor during the time necessary to make one hundred revolutions, for, as has already been seen, the cam C only causes one aspiration per 100 revolutions. The dimensions of the cylinder Q have been calculated so that with the motor running at full power the whole of the gasoline contained in T will not be consumed during the 100 revolutions. In practice, indeed it will be found that the opposite will occur, the motor being throttled down to such an extent that it will consume but a half, a quarter, or may be but a tenth of the full amount of fuel contained in T. In such a case, the liquid being practically incompressible, the spring I cannot drive the piston more than a half, a quarter, or a tenth of its maximum stroke. The reciprocating movement of the piston is therefore always proportionate to the amount of gasoline consumed by the motor. If fuel con-

FIG. 2.—Two-way cock by which gasoline arrives from tank, is passed to the gasoline meter, and sent to carbureter. Position in sketch shows the meter open.

FIG. 3.—Sketch of the complete apparatus as seen through plate glass front. Upper dial shows amount of fuel used; lower one indicates hundreds of revolutions of the motor. At base, outside the casing, are shown flexible shaft, inlet and outlet.

sumption is high the reserve in *T* is rapidly used up, the spring drives the piston *J* to the end of its stroke, and the cam *C* produces a complete aspiration of gasoline. Inversely, the movement of the piston is small if consumption is low.

Revolutions and Fuel Consumption Shown Concurrently.

This arrangement gives at one and the same time the number of revolutions made by the motor and the amount of fuel consumed by it. On the shaft of the cam *C* is mounted a pinion *B*, which, operating through *E*, drives an ordinary counter *F*; this registers the number of motor revolutions.

On a certain length of the connecting rod, corresponding to the maximum stroke, is a toothed rack to which is connected a pinion *K* carrying two ratchets operating in one direction only. On the intake stroke of the piston the pinion turns from left to right and the ratchets drive the wheel *M*, within which they are mounted, thus operating the counter *N*. Naturally this wheel is only carried round a distance corresponding exactly to the movement of the rack; if the aspiration is small, the wheel *M* only revolves a few teeth,

is more favorable to moderate fuel consumption than is low speed. One motor on which it was tried was found to consume double the amount of gasoline when running at 500 revolutions per minute without load than when driving the car under normal conditions. If the constructor had been able to obtain use of the apparatus when testing his engine he would certainly have made changes. The loss of gasoline through leakage is readily determined by the use of the apparatus. The results obtained over ordinary roads can be noted and compared with the consumption of the engine at any future time.

How the Simple Theory Is Modified in Practice.

For practical purposes it has been necessary to make several departures from the simple sketch shown and referred to. Thus, the spring *I* is replaced by two long springs at each end of a balance arm, drawing the piston towards the left. A comparison of the two designs, Figs. 1 and 4, will show in what respects the simple principle has had to be modified to obtain a practical application. The eccentric *B* has been re-

FIG. 4.—Elevation of the mechanism of the gasoline meter. This will be better understood by comparing it with Fig. 1, indicator letters being the same on the two. Fig. 1 shows the elementary simplicity of the apparatus; Fig. 4 represents it as it is actually constructed.

and the counter only registers a small movement. When the rack moves towards the left (outlet) the pinion *K* turns from left to right with its ratchets, but the wheel *M*, and in consequence the counter *N*, are not disturbed. The amount of fuel consumed, which corresponds exactly to the movement of the connecting rod of the piston, as explained, is obtained in larger or smaller fractions, the volumes consumed being totalized by the counter.

It should be noted that there are two separate indicators, one registering the number of liters consumed and the other the number of revolutions of the motor. By means of these it is possible to read the consumption of the engine with the throttle at varying positions, the motor running free, or on various gears, etc. A glance at the sketch will show that the design of the apparatus is such that at every hundred revolutions a pointer moving over a dial *K* registers separately the amount consumed during the last hundred revolutions. The value of this hardly needs amplification. To take but a few examples, it was shown by the apparatus that the consumption of a motor in town work was considerably higher than in open country. Other things being equal, high speed

placed by a disc carrying a short shaft *E''* on which the wheel *E* revolves. The pinion *E* is twice as small as the fixed tooth wheel *W*, and disengages from this latter to allow the movement of the piston obtained by the eccentric.

The disc *W* is driven by the shaft *B''* operated by a worm gear through a flexible shaft connected up to the crankshaft of the motor, the camshaft, or the pump shaft, as may be most convenient. The entire mechanism is contained in a metallic case with a strong glass front, every part thus being visible from the outside. To the connecting arm carrying the two springs is attached a metallic band *X*, which drives the drum *K* in one direction only. A small spring maintains the band stretched to its limit; the arrangement within the drum is the simple one of a ratchet and free wheel. It is by means of this dial *K* that the consumption per liters per hour can be obtained instantly. If, for instance, at the moment of aspiration the indicator marks the figure 20, the driver knows that, providing the same conditions are observed for one hour, the consumption of the motor will be 20 liters.

Under the gasoline meter is installed a two-way cock by means of which the flow can be opened or cut off.

LETTERS INTERESTING AND INSTRUCTIVE

ABOUT RETIMING A MAGNETO.

Editor THE AUTOMOBILE:

[1,133.]—Will you kindly give me some information as to how to time a Bosch high-tension magneto that has been removed from a four-cylinder engine, without first having marked the gears or couplings, whichever may be used for driving it?

Saratoga Spa, N. Y.

A FRIEND.

Open the petcock of the forward cylinder, or take out the spark plug, if located in the head, so that the position of the piston may be noted. This may be done by taking a piece of small gauge stiff wire and inserting it in the hole thus made. Turn the engine over until the wire ceases to drop and starts to rise again. This will give the lower dead center and the upper dead center may be found in the same way. Take off the valve covers of the same cylinder and, by noting the action of the valves, turn the engine over slowly until it is brought to a point where the piston of the first cylinder, counting from the radiator rearward, is at the upper dead center and about to start downward on a power stroke. This will be the case where both the valves have remained closed during the last upstroke, corresponding to the compression.

Uncover the contact breaker as well as the distributor of the magneto, and turn the shaft of the latter by hand until the armature is in a position where the contact breaker has just opened the circuit to fire cylinder number one. Mesh the driving and driven gears of the magneto drive as closely as possible at this point. It may be found necessary to move them half a tooth one way or the other to effect this, and this should be done with the magneto gear. The allowance for advancing and retarding the time of circuit opening in the latter will compensate for this. Reassemble and test the engine in this position. If it is found that there is insufficient allowance for timing the spark one way or the other with the coupling in this position, disconnect the magneto and move ahead or back one tooth and try again. For running under normal conditions the spark should occur a short time before the piston reaches the upper dead center prior to a power stroke.

VALUE OF LONG OR SHORT STROKE RODS.

Editor THE AUTOMOBILE:

[1,134.]—Please advise me if the wear on connecting rods in a short stroke engine is greater than in one with a long stroke. A practical repair man, disinterested in the make of any automobile, claims that where there is a long connecting rod, the angle is not so acute, which prevents sidewise thrusts on the connection at the crankshaft, thus preventing the wear and tear at this point. Theoretically this seems to be correct, but does it apply practically? The Reo makes a long stroke engine, the Maxwell short stroke, and by inquiry I learn that the latter owners have no more connecting rod adjustment to do than the former. Can you explain where above mechanic's views are wrong in columns of "Letters Interesting and Instructive?"

L. C. BURGARD.

Columbia, Tenn.

The mechanic is quite correct in stating that there is less strain imposed on the connecting rod of a long stroke motor than where the latter is very short, owing to the angle at which the latter operates and the fact that you do not find any great difference in a single instance is hardly sufficient to disprove this. It is correct both theoretically and practically, but the difference between what is a "long" and a "short" stroke in the case of an automobile motor is slight—so much so that the corresponding difference in the service rendered is practically a negligible quantity. The longer stroke also imposes less side thrust on the cylinder wall, this being overcome to a great extent in many instances by offsetting the cylinders on the crankshaft center.

HOW TO TEST VIBRATOR COILS.

Editor THE AUTOMOBILE:

[1,135.]—Referring to letter No. 1,132, in which the writer suggests that 1-4 ampere is ample to get good results from dry batteries, would like to know how to make this test. I have a four-cylinder Winton and always carry with me a pocket ammeter. In adjusting the buzzer on the coil I have always simply examined it to see if it would vibrate, and nothing more. Can I with a pocket ammeter regulate the coil so that I will use only 1-4 ampere, and where do I connect the ammeter to make this test? Must the connection be made with the buzzer on the coil, or where?

Newark, N. J.

F. H. THOMPSON.

The ammeter should be connected directly in the primary circuit, that is, the wire leading from the battery to the coil to be tested so that all the current employed will pass through it. To do this, disconnect the battery wire from the coil and connect it to one of the terminals of the instrument; the second terminal of the latter should then be connected to the coil so that the ammeter practically forms a link in the circuit between the battery and the coil. Start the engine and run it at about normal speed. Then adjust the vibrator until the current consumption is reduced as low as it possibly can be, consistent with good running of the engine. However, the ordinary ammeter, or battery tester, is not well adapted for making such a test, as it is calibrated to read up to 25 to 30 amperes and, as a consequence, the divisions are very small. Special instruments are on the market for this purpose, their scales only reading to 3 amperes by tenths. Owing to the fluctuation of the needle it would be practically impossible to adjust a coil to take not more than .25 ampere with the ordinary battery tester, as the needle will swing over several divisions of the dial, amounting to as many amperes, every time the current passes.

IS THE IGNITION TIMING DERANGED?

Editor THE AUTOMOBILE:

[1,136.]—Please inform me how you could connect the ground wire and positive wire so as to make a magneto run. Does it call for a two point switch? The magneto is connected to the motor.

I also wish to know why I can advance throttle and spark the full length of the quadrant when clutch is disengaged without a knock, but running on the level or on a hill with the spark half way advanced, I can at no time when the clutch is engaged advance the throttle of not over quarter way without getting a knock. Even doing this I get a knock going down. I know it is not in the bearings, or because of carbon, as all have been cleaned. I thought perhaps the gearing of the car was too high. Please give me all the information you can.

F. R. B.

The data you give concerning your magneto is very ambiguous, but we presume it to be of the low-tension type, as you speak of a "positive wire," by which we presume you mean one taken from the generator to the ignitors. There is generally no outside ground connection on a magneto, whether low or high tension. The winding of the armature is grounded on the core of the latter, so that fastening the magneto in place on the motor grounds it without further attention. By "connected to the motor" we presume you mean a mechanical connection, but are not certain; in fact, find it impossible to get at just what you wish to learn and must ask for further and more detailed particulars.

Regarding your second query, if you are quite certain that the knock is not due to the bearings, which cannot be presumed without a close examination, particularly in view of the fact that the engine will run quietly when idle, it would appear that the ignition timing may be deranged. That is, the actual occurrence of the spark in the cylinder takes place at a point greatly in advance of what is represented by the position of the spark-advancing lever, so that the result is

equivalent to that of preignition. That is, going on the assumption that neither loose bearings nor carbon deposits are the cause. Your suggestion that the gearing may be too high, in turn suggests the question, Has the car always given this trouble, or is it something of recent origin? An inherent fault such as this would be more than likely to show itself earlier in the use of a car. Investigate the ignition timing, also the bearings, and see if one or the other is not faulty.

HOW TO MAKE A HOME-MADE VALVE-GRINDER.

Editor THE AUTOMOBILE:

[1,137.]—As I am very much interested in your "Letters Interesting and Instructive," I wish to do my share in making it interesting to others. The enclosed cut will speak for itself. It is a home-made valve-grinder. I made it from an old brace such as is used by any carpenter. I straightened out the crank part and then cut it off about 8 inches long, heated it and made a regular screwdriver point on it; then, forcing the hand off the top of the rod, I bored a hole in a piece of pitchfork hand and slipped it on the rod, pinned it fast by a steel pin, after boring an eighth of an inch hole clear through wood and steel rod. I then took a stout, heavy cord and tied a knot in it and then to the pin, gave it several turns around the wood and fastened a weight to the lower end and took hold of the upper. In this way I can seesaw and grind a valve in good shape. In case one does

DETAILS OF THE HOME-MADE VALVE-GRINDER.

not have a horizontal engine and the valves are vertical, one can work it with both hands or it can be worked without the cord. I find this one of the handiest tools I have in my set, which I always keep in the auto tool box. In my motor I have an opposed air-cooled engine, laying horizontal under the seat; it is a 4 by 4, and the fan flywheel, instead of driving the air from the engine, sucks the hot air away from the engine. Is this the best plan? Seems to me if the engine would drive the hot air off the cylinders instead it would not heat as quick. V. R. LANE.
West Liberty, Ia.

The sole object of the fan is to induce a draught of air over the heated portions of the engine and whether it does this in one way or another is immaterial. In fact, on many present-day cars, both methods that you speak of are employed, the fan behind the radiator drawing cold air through the latter and throwing it on the engine, while the flywheel fan draws the warm air away from the engine.

FIGURING THE RATIO OF PLANETARY GEARS.

Editor THE AUTOMOBILE:

[1,138.]—Will you kindly tell me in your next issue what the ratio is between the low speed and direct drive in a planetary transmission as follows: Driving gear on crankshaft 20 teeth. pinions on spider or driving sleeves, 12 teeth, internal gear 44 teeth. Now, when the internal gear is held stationary, how many revolutions does spider or driving sleeve make to every 100 revolutions, and what is the rule for determining the above?
Calumet, Mich. GRANVILLE BENSON.

Let G = driving gear on the shaft = 20 teeth; I = internal gear = 44 teeth; P = pinions = 12 teeth. With the internal gear I held and the central gear G running as a driver to reduce the speed, the planets or pinions P turning on studs in

the spider, it will be evident that G will have to make one more complete turn to drive the planet round its orbit than the direct relation between the driving gear and the internal gears G and I . Thus with G half the size of I , the ratio would be 3 to 1, and with the figures you supply, it is 3.2 to 1. In the same manner, when the planet is made the driver, it will give the central gear one more turn than the ratio between the internal gear and the sun or central gear. The easiest manner to figure this is to divide the internal gear by the central gear and add one, which will give the low-speed ratio in this case. There are probably a dozen or more different methods of calculating these ratios, many of them of a highly complicated nature, but where the number of teeth in the various gears are evenly divisible, they may be figured without any great difficulty by adding or deducting one turn, according to which gear happens to drive.

FIGURING THE POWER OF TWO-CYCLE ENGINES.

Editor THE AUTOMOBILE:

[1,139.]—Will you please send me the formula for figuring the horsepower of a two-cycle engine?
Chicago, Ill. A. J. OESTERBECK.

About as simple a formula as any is the following,
$$\frac{D^2 \times L \times R \times N}{18,000} = \text{Horsepower, in which } D \text{ is the diameter of}$$

the cylinder, or bore; L , the length of the stroke in inches; R , the number of revolutions per minute, and N , the number of cylinders, while the denominator is an arbitrary quantity based on the use of gasoline as a fuel. There are numerous other ways of figuring the power of a two-cycle engine, though the foregoing will be found as simple as any, and likewise about as accurate as any of the others. The brake test is really the only definite means of knowing what an engine's capacity is. The only difference in calculating the indicated horsepower of a two-cycle engine, as compared with a four, is to allow for the extra power impulse.

MORE IN AID OF MR. WEBB.

Editor THE AUTOMOBILE:

[1,140.]—In letter No. 1,117, J. S. Webb asks for information in regard to a Ford runabout. Last summer a car was pulled into the garage where I was employed; it wouldn't go. The motor acted as Mr. Webb's did, and they could not make it run. The first thing I did was to test the coil, and found that one of the vibrators was stuck in such a manner as to short-circuit the current and keep the other buzzers from going. It would fire on the stuck vibrator, but not good and strong, as it should. After this was fixed it would stop the whole engine on high speed, and it would stick partially and cause the motor to miss, as if it was faulty carburetion. Finally, by changing the units and putting in new platinum, the difficulty was overcome.

Would you kindly advise me through your columns if there is a technical school for learning automobile engineering as you would learn any other branch of engineering?
Roselle, Ill. E. A. MARTENS.

The New York School of Automobile Engineers, located at 146 West Fifty-sixth street, New York, offers such a course as you inquire about.

USING A VOLTMETER TO TEST CELLS.

Editor THE AUTOMOBILE:

[1,141.]—I made a mistake in my query. Is a voltmeter as hard on batteries as an ammeter when testing?
Warren, Mass. LOWELL ELLIS.

Owing to its high resistance, a voltmeter does not run a cell down in the same manner as an ammeter, but testing dry cells with a voltmeter gives but little indication of their condition, as a cell may show practically full voltage and still be all exhausted. The voltmeter, however, should always be employed in connection with storage batteries; in fact, it is dangerous to use an ammeter on a fully charged accumulator and is apt to result disastrously to both the ammeter and the accumulator.

CAN ANYONE SUPPLY THIS INFORMATION?

Editor THE AUTOMOBILE:

[1.142.]—I have a runabout which is a Buckmobile. I bought it second hand. I cannot find out where it is made, nor do I know, but I think the firm that made them is out of business. Will you, if you can, give me the address of the firm if it exists, and if not, who could I address that could give me information about it?
J. H. TOWNSEND.

Danbury, Conn.

We do not know the address and are under the impression that the firm is out of business. Probably some of our subscribers can furnish more definite information on the subject.

TO USE GAS IN A GASOLINE MOTOR.

Editor THE AUTOMOBILE:

[1.143.]—I would like to have you advise me what changes have to be made in the ordinary gasoline engine to use illuminating gas as fuel.
T. F. W.

Providence, R. I.

It is only necessary to remove the carbureter and connect the engine to the gas supply through the intermediary of a gas-mixing valve, which can be obtained from any supply house. The function of this valve is to mix the gas and air in the proper proportions to obtain a suitable fuel.

VIEWS OF A TIRE EXPERT ON REPAIRS.

Editor THE AUTOMOBILE:

[1.144.]—In your issue of January 23 I notice that you have a subscriber who wishes to know the best cure for a blow-out in an automobile tire. As I am considered an expert on tire works I have decided to give you my opinion. There is only one way of curing a section or blow-out, and that is in a steam vulcanizer in a sectional mold. That is dry heat, created by steam, and the heat of such cures depends entirely on the stocks used on repairs. When you put a section in a tire and place it on a rim, and wrap it and put it into a steam kettle, you certainly overcure the old rubber and make it soft, and when it does dry, it will harden and crack. It is also liable to separate the fabrics. It is all right to put a retreaded tire through the kettle, as that is the simplest method. Of course, some tires are molded in a complete mold.

A section or blow-out repaired properly with good stock and cured properly with a strong pressure on air bag in the proper mold cannot be equalled in strength, looks, or service by a wrapped steam cure.

I am doing repair work for the best house in Boston and have very rarely a section come back that has done less than 500 miles and in many cases over 1,000 miles. I cure all my casings in an automobile tire vulcanizer with section molds. Only yesterday I cured fifteen sections, and they were all perfect and hard to beat for looks or strength. I have made tires in two factories and worked in three. Have been repairing bicycle single tubes, automobile tires, and the up-to-date tires of all makes and descriptions, and want to see the tire I cannot repair if it is profitable to the owner of such tire, since 1896—about eleven years—and I think my opinion is worth considering.

My ideas of repairing are my own and cannot be beat like other tire men. I keep them to myself because it makes my business better. I pass judgment on about 3,000 tires in a season.

Boston, Mass.

JAMES P. BROPHY.

IN REBUTTAL FROM MR. POOLE.

Editor THE AUTOMOBILE:

[1.145.]—As Mr. Fay's reply (No. 1,124) to my comment (No. 1,106) on his article consists chiefly of quibbling, it is rather difficult to continue the discussion in good temper. Mr. Fay originally made the broad general statement that the mixture drawn in by a gasoline engine at high speed is poorer than that drawn in at low speed; he did not say that this was true if the carbureter had an auxiliary air valve poorly adjusted; he stated it as a general proposition without reference to the type of carbureter used. He evidently realizes now that his statement was erroneous and tries to take refuge behind the fact that his article contained an illustration of a carbureter with an auxiliary air valve, to which no reference was made in connection with the criticized statement. This not only is unfair, but it does not make his original statement true as it stands.

The question of scavenging is a difficult one to discuss. I can only say that experiments made by myself and others have shown that, within the limits of rational engine speed, better scavenging is obtained at high than at low speeds, provided the exhaust valve is not too small for the engine. With a properly proportioned

exhaust valve, increased speed will, by reason of the increased "suction" effect of the outgoing exhaust gases, give better scavenging up to the speed where the increased friction of the exhaust passages just neutralizes the increased suction effect; beyond this point, the scavenging effect decreases rapidly with increased speed for which the engine is adapted. Of course, I am referring to engines working on the four-stroke cycle and taking practically the same quantity and quality of mixture per cycle at all speeds. In making a general statement of any kind it is usually understood that all conditions remain fixed except those affected by the statement.

Mr. Fay's quibble over the word "combust" is unwarranted. He deliberately clouds the discussion by talking about "combustion" and "combustible," to which terms I did not refer at all, and indulges in some irony about the age of dictionaries. The facts in the case are these: Mr. Fay used the verb "to combust" in the sense of "to burn"; the verb "to combust" means to cause popular clamor or to excite the public mind, and no matter how ancient Mr. Fay's preferred dictionary, he will find in it that definition, in substance; the definitions of "combustion" and "combustible" have nothing to do with the definition of "to combust" and were not referred to in my letter.
CECIL P. POOLE.

New York City.

INTERESTING EXPERIENCE AND INFORMATION.

Editor THE AUTOMOBILE:

[1.146.]—In reading over your "Letters Interesting and Instructive" in the current issue, I felt inspired to write the following:

Regarding letter No. 1,113. Your correspondent might find considerable trouble, at times, from the timer binding posts contacting with pieces of the crankcase, transmission, etc. The timer is tucked away carefully in a cute little nest under the dash between the planetary change gear and engine frame. I often had this trouble. Maybe I should have said wires, instead of binding posts grounding.

Concerning the carbureter trouble. Your correspondent speaks of "dash regulation," which suggests the Holley carbureter. I have a Holley on my Model N; it has dash control, and I have a trouble similar to the one described in your paper. Mine was caused by the cork float absorbing gasoline and changing the level in the air passage.

C. S. G. states, in letter No. 1,128, that for 6,000 miles his car only cost him 4 1-2 cents per mile to operate. Repairs alone cost me almost that. I got my car last June, and started keeping records July 1. On December 1 I totaled things up. In that time, five months, I had driven same 3,500 miles, used 215 gallons of gasoline, paid out \$125.70 for repairs and replacements, of which \$22.30 went for dry cells and \$22.35 for springs, new and repaired. I got wise and put in a Holley magneto and stopped all ignition expenses thereby. I used 22 gallons of lubricating oil, getting only about 160 miles out of a gallon, and I declare I don't see how anyone can possibly get 500 miles with one of these cars. Expense per mile sums up like this:

Replacements and repairs.....	.358 per mile
Cleaning and garage rent.....	.068 " "
Gasoline (24 1-2 cents per gallon).....	.150 " "
Lubricating oil050 " "
Tires100 " "
	<hr/>
	.726 per mile

Since I have had the car, I have spent a little over \$200 on improvements, which covered lamps, magneto, carbureter, top, etc. Have a very trying road to travel, 10.1 miles each way, over natural Colorado roads, good a short time, and full of chuck holes most of the time. Make this trip nearly every day; are building a mill at the terminus, concrete. Drive a good bit besides this, for pleasure.

The machine has done very well indeed, and while I have had villainous carbureter and ignition troubles, before I tore out the crude equipment that came with the car, have never failed to make my trips on schedule, 40 minutes. When the road is heavy with mud, as it is very rarely, probably has been for two weeks altogether in the time mentioned, it takes seven minutes longer to make the trip. However, the car is now pretty well racked; every rivet is loose from the eternal jarring.
T. B. RENNELL.

Florence, Col.

TO THE SUPPORT OF MR. FAY'S VIEWS.

Editor THE AUTOMOBILE:

[1.147.]—As Mr. Fay says, the needle valve is a makeshift, and should not be tolerated on any well designed car, for reasons as follows:

It complicates the carbureter by making extra parts. It is something for the novice to fool with when he wants "to improve the running of his car." It destroys the true nozzle effect. Its construction is such that it gives a very small opening all around itself—the least bit of dirt, corrosion, water or in fact almost any-

thing is prevented from passing. It is not at all essential to the operation of the carburetor.

Only last week, having a carburetor to adjust on a two-cylinder, 4x4 3-4-inch engine, I made an experiment as follows: The carburetor was adjusted by the needle valve, float and air valve, to give the best results and the performance of the car noted. Three nozzles were then made with fixed openings, Nos. 54, 57 and 60 drills being used. Nos. 54 and 57 were tried and found too large. No. 60 was then tried and found to give fair results. No. 54 was plugged with solder and reamed out slightly smaller than No. 60. This gave as much power and speed as with the needle valve, without any of its faults, besides being able to run the car at a very low speed with little or no vibration, an impossibility before the change was made. The principal reason for making the change was the constant plugging up of the nozzle on account of the very small opening around the needle valve, obliging the driver to get out and open the valve, to wash the obstruction out. This same trouble was on a number of cars the writer has had to do with.

The needle valve seems to be a feature of the cheaper American cars, being very seldom used on the high grade cars, and practically not at all on the foreign cars.

If as Mr. Poole says, the scavenging effect is better and the timing of the spark is as accurate, the engine should deliver its maximum power at its highest speed, which is very seldom the case.

C. T. BATES.

South Easton, Mass.

MORE IN SUPPORT OF THE "SIX."

Editor THE AUTOMOBILE:

[1,148].—I beg leave to take up the cudgels in the four-cylinder versus six-cylinder controversy. It seems to me that many of the articles lately appearing in the various trade papers and magazines are written either by people who are ignorant of the actual properties of the six-cylinder engine, or else know nothing of the practical mechanics of the gasoline engine in general.

If the ones who are always howling about the sixes being no better than the fours would only take a little ride in a six, they would soon change their minds. The six has less vibration than

seems queer, to say the least. Also, I would like very much to see the carburetor that will make the power strokes overlap as in a six. In order to show this overlapping graphically I am enclosing a rough drawing which may serve the purpose.

While I am at it, I would like to take sides with Mr. Fay in his discussion on carburetors. As he says, when a carburetor is especially designed for the engine to which it is attached, and if it takes its air supply through a perforated sleeve surrounding the exhaust pipe, the quality of the air entering the carburetor remains so nearly constant that a non-adjustable spray nozzle will give most excellent results. But if the carburetor has a plain cold air supply, absolutely unheated, every change in the temperature and humidity of the air will affect the mixture to an appreciable extent; a fault that can be most quickly and easily remedied by changing the amount of gasoline flowing through the nozzle. It would seem, therefore, that an adjustable nozzle would be best in such cases. I may add that these last facts concerning carburetors are taken from actual personal experience.

GEORGE SAUTTER.

Newark, N. J.

FROM AN OHIOAN ABOUT BLIND DRIVERS.

Editor THE AUTOMOBILE:

[1,149].—I have read with considerable interest in your issue of January 23, the account concerning a bill which is soon to be up before the Ohio Legislature, and gotten up by the Hon. Elijah Hill, to make it lawful for a blind man to operate an automobile in the State of Ohio. Living in Ohio myself, I am, of course, very much interested, else I would not have given the article a second thought. There has been, from time to time, various schemes brought forth for the purpose of drawing revenue from the autoist, but this one seems to be about the cap sheaf of them all. It would seem to me that any person whose vision is in any way impaired would drive in a very careful manner or else quit the game entirely, if only for his own safety.

This bill not only hits the owner, but the chauffeur as well, who must dig up five of his hard-earned plunks to help maintain this soft, specially created \$1,500 job, and all he has to show for his money is a paper which tells him he can see just as good as he could before.

I sincerely hope that when the bill comes up it will be killed dead, for I and, I think, a good many other Buckeye autoists are tired of constantly paying out five dollars for this and five dollars for that. However, my views may be wrong or prejudiced; if so, I am willing to stand corrected.

R. J. THOMPSON.

Orlando, Fla.

THE TROUBLE IS IN THE TIMER.

Editor THE AUTOMOBILE:

[1,150].—Some three or four issues ago, in Letters Interesting and Instructive, I noticed a communication from a man who owned a Maxwell car. He had experienced trouble with a motor missing, particularly at high speed, and he believed that the trouble was in the carburetor.

The writer is very familiar with the Maxwell, and I am positive that the trouble was not in the carburetor. As a matter of fact, the Maxwell car, though not automatic, is simple, and not liable to get out of order. I believe the trouble in this case was in the commutator. The tension is controlled by a small spring. This frequently loses its elasticity, so that when the motor is speeded up the spring is not able to return the arms into position in time to make the next contact.

If your reader will put on a stiffer spring, or attach two of these springs instead of one, I think he will have entirely eliminated the trouble. Of course, the trouble may also have been with the contact arms, as well as the cam being badly worn. If this is the case, it is a very inexpensive matter to replace with new contacts.

New York City.

H. A. GRANT, M.E.

IN AID OF A FORD OWNER.

Editor THE AUTOMOBILE:

[1,151].—In your issue of January 23 I note the trouble had by J. S. Webb with his Ford runabout in regard to throttle action. Have had a like experience with my car and remedied it by draining the gasoline tank, in which I found a little water, which was the cause of the trouble. I think if Mr. Webb will do likewise and put in a new supply of clean gasoline it will eliminate the trouble.

J. C. JEKEL.

Independence, Ia.

ROADS INFORMATION WANTED FROM GEORGIA.

Editor THE AUTOMOBILE:

[1,152].—Kindly answer in the columns of your "Letters Interesting and Instructive" the following: Are the roads in Southern Georgia, near Waycross, too sandy to drive an automobile on?

Toledo, O.

H. L. Y.

the four, and no amount of theory can disprove this. The six furnishes stronger driving power than the four at all speeds, is more silent, has more perfect carburetion, and is as simple to take care of as a four. Anyone doubting these facts would do well to investigate the six thoroughly. In regard to the comparative simplicity of the two types of motor there seems to be a good bit of disagreement. For instance: "Fifty per cent. more ignition apparatus," shouts one manufacturer, while another facetiously replies that "if a four-cylinder motor requires one magneto, we hasten to assure an innocent and unsuspecting public that a six-cylinder motor does not require one and a half magnetos." Take the magneto as a concrete example; is the six magneto 50 per cent. more complicated than the four? Not by quite some. It has two additional contact points, with no more moving parts, and that is all. Again, it seems perfectly natural that an engine maintaining a continuous suction in the carburetor will get a more perfect mixture than one that keeps up only a fitful and constantly varying suction.

Some of the authorities (?) in the automobile world seem to lose sight of the original object of their argument in their anxiety to outdo each other in this so-called "nature faking." Then, again, there seem to be others who bring in arguments that have no foundation in fact, and palm them off as convincing. Two gentlemen, for instance, claim the remarkable powers of producing constant torque by means of carburetors and flywheels respectively. I cannot help but feel sure that there is a fortune awaiting both of these gentlemen when they succeed in doing what they claim to be able to do. No matter how heavy the flywheel, at every impulse of the piston it is going to receive a certain amount of acceleration, and during the succeeding idle stroke (in a single cylinder, for example) it is going to lose a certain amount of its momentum. That the torque of such an engine should be called continuous

THE SIX-CYLINDER, 75-HORSEPOWER GEARLESS LIMOUSINE FOR 1908.

THOUGH the line of Gearless cars for 1908 will comprise three distinct models, doubtless the makers—the Gearless Transmission Company, Rochester, N. Y., will devote a large part of their time and attention to the production of their Model 60, which is a convertible five or seven-passenger touring car. The cylinders of the motor of this model measure 5 inches bore by 5 3-4-inch stroke and are offset on the crankshaft center. They are cast in pairs and the valves are all placed on the same side and are operated from a common camshaft placed on the left hand side of the motor. The crankshaft is turned from a solid billet of high-carbon steel and is finished by grinding. It is supported on three liberal-sized bearings of Parson's white brass. The valves themselves are made of nickel-steel, and advantage has been taken of the method of valve arrangement to place all the auxiliaries of the motor on the right hand side, thus making them very accessible. The timer and magneto are both located at the rear, just forward of them is the carbureter, the intake pipes being led over the tops of the cylinders between the two pairs, thus making an extremely simple intake manifold, as will be evident from the valve side of the Model 60 motor, which is shown herewith.

Further forward on the same side is the mechanical force feed oiler, having eight individual leads, which are taken to the main bearings, the lubrication also being supplemented by splash in the crankcase. Dual ignition is provided, one system comprising a self-contained unit in the shape of a Bosch high-tension magneto, while the other consists of a standard four-unit

vibrator coil, low-tension timer and set of accumulators as a source of current supply. Independent spark plugs are employed for each system, those connected with the magneto being placed over the inlet valves, while those of the second system are placed over the exhaust valves.

The heavy car of the Gearless line is officially known as Model 75, and more familiarly as the Gearless "Great Six," which is equipped with a six-cylinder, 75-horsepower motor. The latter also forms the power plant of the "Gearless Greyhound," which is the third member of the line and is a high-power roadster model of the same type that made a name for itself by accompanying Weston at a four-mile-an-hour pace for almost 800 miles last November. In consequence the description of the motor of the touring car will apply to both. The cylinders measure 4 13-16-inch bore by 5 1-2-inch stroke. The valves are oppositely disposed and have their seats water-jacketed, while the carbureter is placed on the right hand side of the motor, a very simple type of manifold being employed. The Bosch high-tension magneto employed for ignition is also placed on the same side of the motor, two independent systems being employed as on the smaller motor. Simplicity and accessibility have been the aims of the designer throughout, the gears for operating the camshafts, timer, magneto and pump consisting of a steel pinion on the crankshaft, two bronze gears on the camshafts and steel pinions on the latter operating the magneto and pump. These gears are all housed in an aluminum casing and are run in oil, thus being free from grit and mud. The water

THE SIX-CYLINDER ENGINE, SHOWING ITS COMPACTNESS.

INTAKE SIDE OF THE MODEL 60 MOTOR

pump is of the centrifugal type and is permanently fastened to the engine.

To provide the necessary lubrication, a supply tank of oil is attached to the forward face of the dash, thus placing it in a position where the oil is constantly maintained at an even temperature in spite of weather conditions. From this tank individual tubes of liberal diameter lead directly to the main journals of the engine. Upon reaching the main bearings, which it serves to lubricate, it passes into holes drilled through the crankshaft, so that it also oils the crank-pins. This oil is drawn to the pins by centrifugal force and from there is thrown off in a fine spray, thus taking care of the piston and cylinder lubrication as well as that of the wrist-pins, combining in this manner all the advantages of the force feed and splash systems of lubrication. The surplus oil drips down from the interior of the motor and collects in a receptacle formed in the aluminum oil pan on the bottom of the motor, from which it flows to a pump by gravity and is automatically returned to the supply tank, first passing through a fine-mesh double screen which thoroughly cleans it.

The carbureter is of the multiple jet type, two independent jets being employed. It is employed in connection with a piston throttle and is water-jacketed, thus economizing fuel and facilitating the starting of the motor in cold weather. The advantages of this type of carbureter are that it practically embodies two carbureters in one, allowing the driver

EXHAUST SIDE OF THE MODEL 60 MOTOR.

to handle the car at very low speeds with the throttle nearly closed, using the small carbureter only. By opening the throttle further, the larger carbureter comes into action automatically, thus supplying the engine with the proper quantity of fuel at different speeds. In this motor both spark plug terminate in the intake valve pocket, those of the magneto being placed at the side and at right angles to the cylinder, while the others are placed over the valves.

As is naturally to be supposed, while the motors of the Gearless cars are by no means lacking in distinctive features, interest centers in the change-speed gear from which the cars take their names. This is the patented gearless transmission, giving two speeds forward and reverse without the use of any gears, the high-speed being direct, in which the change-speed elements revolve together as a unit, with no internal friction nor rolling contact, the entire change-speed unit revolving together as a flywheel. It consists of six large special fiber rolls of conical shape revolving on and in an exterior and interior cone. These two cones coact with a sliding, double-faced, solid jaw clutch, which

PLAN VIEW OF THE PATENTED GEARLESS TRANSMISSION.

is moved to the extreme forward position to give the low speed forward, and to the extreme rearward position to give the reverse. The internal cone is constantly pressed toward the external cone by means of a spring, so as to always insure "bite" enough to make the six cone rollers revolve without slipping in the low speed and reverse drives.

The Gearless transmission has the advantage of no change-gear friction whatever on the high speed, or direct drive, and rolling friction engagement in the low speed and reverse. The coned rollers are held laterally in a cage of large diameter and press against a gray iron cone made fast to the extension of the motor shaft. On their opposite faces they press against an internally faced cone, also of gray iron, and which is concentric with the propeller shaft of the car. The cone, roller and cup angles are such that the three elements roll together without any sliding, and hence without sliding friction, save in case of the slipping of the six rollers. To avoid the slipping of the rollers on the cone or in the cup a heavy spring pressure is applied to the cone cup to force it towards the driving cone, this pressure being sufficient to make it impossible for the motor to slide the roller surfaces on the cone or in the cup.

THE ELMORE "40"—THE TWO-CYCLE, FOUR-CYLINDER, "VALVELESS" CAR.

SO far as the substantial elements of their construction are concerned, the Elmore cars for 1908 are, well—the Elmore cars, for there are so many distinctive features about these consistent advocates of the two-cycle principle that nothing short of this suffices to describe them in a word. Numerous improvements have been made on the models for this year, chief of which has been the adoption of the Atwater-Kent spark generator as the means of ignition. The makers of the Elmore, the Elmore Manufacturing Company, Clyde, O., had this system under test for a long while prior to its formal adoption as a part of the standard equipment of their cars, and it showed up so strongly under the most rigorous of tests that its adoption was a foregone conclusion right from the start. The installation of this system on the 1908 Elmore cars has enabled the builders of the latter to achieve results in battery economy in the running of their cars that are almost incredible. As a matter of fact, every one of the carefully conducted tests made by the company showed that it was possible to get more than 2,000 miles' running out of a single set of six No. 6 dry cells, which is said to be many times greater than the average mileage obtainable with any other ignition system employing dry cells as the source of current supply.

The builders of the Elmore still retain the distinction of being the only makers turning out a three-cylinder car, this being their 24-horsepower model, known as the Elmore 30, which is listed both as a touring car, and a roadster, the chassis being the same in each case. The heavy car of the line is the Elmore 40, which is the four-cylinder type rated at 40 horsepower. Some of the changes in design made since the preceding year are the placing of the steering arm of the knuckle above the axle instead of below as in the former years, thus protecting it from injury when traveling over rocky roads or bad country. The hubs are now made extremely large, and the balls and hubs of the bearings are now made larger than was the case in last year's models. The belt drive of the oiler has been done away with in favor of a more positive and reliable drive. An im-

proved type of irreversible steering gear has been adopted, this being so constructed that all lost motion due to wearing of any of its parts can readily be compensated for by a simple adjustment. The power plant and all the elements of the transmission, such as the clutch, gear box, propeller shaft and rear-axle unit, have been brought practically into the same horizontal plane, thus minimizing the wear on the universal joints and giving a higher percentage of efficiency at the rear wheels. A honeycomb type of radiator constructed of seamless tubes has been adopted, thus eliminating the frequent trouble from leaks where soldered joints are employed.

Where the motor itself is concerned, lighter pistons are now used than was formerly the case, this being also true of the connecting rods, which are now one-piece drop-forgings. So far as the principle or operation of the motor is concerned, there have been no radical changes. It is the three-port, two-cycle, water-cooled type, the water being circulated by means of a gear-driven pump. The cylinder dimensions are 4 inches bore by 4 1-2 inch stroke, giving the car a speed range of from four to 45 miles an hour on the direct drive. On good level roads, these cars can attain a maximum speed of 55 miles an hour, while their flexibility is surprising. The makers lay special stress on the reliability of the lubrication employed on the Elmore cars, this taking the form of a mechanical force-feed oiler, which forces the oil into the intake pipe, thus insuring an even distribution of the lubricant to all of the cylinders. The carbureter is of the standard float-feed, automatic type, while, as already stated, an Atwater-Kent spark generator and dry cells take care of the essential of ignition.

The gear-set is of the sliding type working on the selective plan of operation by means of a single side lever, and provides three speeds forward and reverse, the final drive being by propeller shaft to the live rear axle. Shafts are fitted to the

ONE OF THE FEW THREE-CYLINDER CARS MADE HERE—THE ELMORE "30."

SHOWING THE GREAT SIMPLICITY OF THE ELMORE CHASSIS.

differential by means of squared ends and they are supported on Hyatt roller bearings and are provided with special thrust bearings. The front axle is a single-piece drop-forging with an extra heavy spindle supported on ball bearings, the inside bearings being equipped with 3-4-inch balls and the outside bearings with 5-8-inch balls. Suspension is by means of the standard type of semi-elliptic springs forward with a three-quarter platform type of suspension in the rear, supplemented by Sager auxiliary recoil springs on the rear axle as shock absorbers. The running gear consists of wooden artillery wheels fitted with Midgely universal rims, the tires fitted being of the same size all round in the case of both cars. On the Elmore 40 the tire equipment consists of 34 by 4-inch tires, and on the Elmore 30, and the roadster as well, of 32 by 3 1-2-inch tires. The brakes are centered in hubs on the driving wheels and are of the internal expanding and external contracting types. Their efficiency is very great, either set being capable of bringing the car to a halt within a short distance, only a slight pressure being required to cause the wheels to slide. The tread is standard on both cars, the wheel-base of the Elmore 30 being 104 inches, while that of its larger four-cylinder brother is 110 inches.

The dashboard of this car is made of mahogany, ornamented with a very heavy brass moulding so placed as to be free from vibration. The toe-board angle has been raised so as to make it much more comfortable than in the previous models. The gasoline tank has a capacity of 20 gallons of fuel, while the mechanical oiler holds six pints of lubricant. As the Elmore 40 will average 12 miles to the gallon of gasoline under any ordinary touring conditions, the radius of the car is very easy to keep in mind. The specifications of the Elmore 30 and the Elmore roadster are identical, while the design and construction of both are carried out in the same thorough manner that characterizes the larger car, or Elmore 40. The latter is listed at \$2,500, while the three-cylinder car lists at \$1,750 in either type.

From the accompanying plan view of the Elmore chassis, which shows the Elmore 40 equipped with a four-cylinder, two-cycle motor, it will be quite apparent that the claims for simplicity and accessibility do not center entirely upon the power-plant, as the lines of the chassis of the car as a whole are quite in keeping with its motor on this score. There is a noticeable absence of complication or small parts, both the design and construction being distinguished by close adherence to the best standard practice, the chassis foundation consisting of the usual channel section pressed steel frame, the motor and change-speed gear being carried on a special sub-frame, while the propeller shaft is inclosed in a heavy steel tube which serves both as a protection and takes the place of the usual torsion rod. The use of the sub-frame for supporting the power-plant and drive permits of the latter being a close approach to a horizontal plane from the flywheel to the rear axle.

MECHANICAL HORN AND PORTABLE RECTIFIER.

Under the title of Klaxon, a new type of mechanical horn, which has much to recommend it on the score of simplicity and efficiency, has recently been produced by Miller Reese Hutchison, a New York engineer. The Klaxon horn consists of only two fundamental parts, a vanadium steel diaphragm and a hardened steel cam wheel. Attached to the center of the diaphragm is a hardened steel anvil, against which the cams on the periphery of the cam wheel strike, producing a violent

KLAXON HORN IN POSITION ON CAR.

inward and outward movement of the diaphragm, with astonishing results in sound propagation. The diaphragm and cam wheel are mounted in a special case, from which leads a flexible shaft that connects to a friction wheel engaging the periphery of the flywheel of the engine. This friction wheel has a grooved face, the tops of the grooves being sharp and hardened, so that should there be oil on the face of the flywheel, the sharp surfaces cut through and engage the wheel without mechanical slip. A distinctive feature of the friction drive is the manner in which the wheel is pivoted to a bracket attached to the lower part of the dash and normally held by a spring against a braking surface. A chain passing over a suitable pulley on the dash and leading up to the steering wheel allows the horn to be put into operation instantly. On releasing hold of the chain the friction wheel is brought against the braking arm again with consequent instantaneous stopping of the sound. The cam wheel is so small and the power required by the Klaxon so slight that the sound reaches its maximum instantly and stops instantly without subjecting the flexible shaft to the starting and stopping torque.

For automobile use the horns are made in two styles, one being short for the dissemination of the sound through a large angle and intended for city and suburban use, while the other is 12 inches over all and intended for touring or use on motor boats. But the horn is designed to have a much wider use than on automobiles, and in view of its efficiency—for it is certainly one of the most powerful sound producers ever created—should be adopted on trains, fishing boats, or even, as is claimed, for use on battleships.

The device can be attached to cars in a few minutes. To make it adaptable to any position or any machine, both the driving shaft and the bracket supporting the pulley have been made reversible. Where not possible to operate the horn by friction, electricity can be employed by attaching a small electric motor. The apparatus can also be adapted for hand operation.

Charging Storage Batteries with the Hutchison Rectifier.

Automobilists who use storage batteries for their ignition system are frequently handicapped and delayed by inability to recharge when desired. The difficulty is particularly felt in rural districts, where, although there may be current, there are not the facilities necessary to make use of it for charging purposes. It is for this reason that a portable charging device, capable of being carried with facility on the

running board of the car, will be welcomed by those who travel by automobile. A device of this nature has been produced by Miller Reese Hutchison, forming, as will be seen from the illustration, a compact and easily portable apparatus. When not in use it is contained in a strong metal case and carried on the running board.

With an apparatus of this nature the automobilist is enabled to charge his battery from any existing electric light socket by merely removing the incandescent lamp from the socket and inserting the plug attached to the charging device. When the plug is inserted and the wires connected to the battery as designated by the tags, the charging device assumes two rôles: it enables the user, if the current is what is known as direct current, but which is seldom used in rural districts, to charge the battery so that the positive wire of the line is connected to the positive wire of the battery, as it should be. If it is alternating current the device rectifies it into direct current, and in such a way as to charge properly.

When connection is made to the electric light socket the lamps shown mounted on the board and used as resistance will light, showing that the battery is being charged properly and no further attention is needed. If they do not light, or burn with a very dull glow, it shows that the current is alternating and that the charging device is not properly connected. It is then necessary to pull apart the little plug screwed into the socket, then reinsert the bottom half of the plug, having turned it one-half revolution before inserting. This reverses the current through the device and through the battery, and the lamps will burn. A switch on the baseboard allows the battery to be disconnected from the charging circuit, and the small central lamp to be connected up. If the battery is fully charged this lamp will burn brilliantly. As the lamp uses considerable current, the temporary apparent charged condition of the battery is quickly run down if it is not fully charged, and although it may burn brightly at first, it will soon become dim. This test allows the state of the charge of the battery being determined without the use of delicate electrical instruments.

The elements of the rectifier consist of two large aluminum plates and one central composition plate, mounted on a support that has attached thereto a couple of lugs which engage the rods leading from the base on either side of the jar. Improper connection is prevented by these rods being of different sizes, with the holes in the connecting lugs each corresponding to the size of its rod. The jar is filled with an acid solution, the acids, which are cheaply renewable, being supplied with the apparatus, and is then ready for use. The contents of the jar being emptied out after charging, there is nothing to spill over and disfigure the box or apparatus.

CHARGING A STORAGE BATTERY THROUGH HUTCHISON RECTIFIER

RAMBLER MOVING SHOP EQUIPMENT AT LOS ANGELES.

ANOTHER USE FOR THE UTILITY AUTOMOBILE.

Moving machinery is the latest use to which an enthusiastic owner of a Rambler has put his car. He is D. C. Wilgus, a manufacturer of Los Angeles, Cal., and the manner in which some of the machines were moved from the old establishment to the new is made clear by the accompanying photograph. The feat which this Rambler Model 22 performed was actually the transfer of a complete machine shop from one point to another, the equipment including planers, lathes and general machine tools.

STUDEBAKER TRUCKS FOR HANDLING METALS.

Two new electric trucks of 3 1-2 and 5 tons capacity that have recently been delivered to the Bourne-Fuller Company, of Cleveland, O., by the Studebaker Automobile Company, of South Bend, Ind., are of more than the usual interest in that they serve to show the adaptability of the electric vehicle to a wide variety of special uses. They are probably the first ever built with special reference to the convenient handling of steel and iron bars, sheets and strips, the driver's seat being located at the extreme left, thus making provision for the overhanging of extra long bars both front and rear. This construction permits of the easy handling of much longer pieces than could be carried on the average horse-drawn truck. Another interesting feature of these trucks is their tire equipment, which is of wood, thus materially reducing their cost as compared with the maintenance of rubber tires on such a vehicle. They are fitted with broad platforms, partly lined with steel to prevent wear. Both trucks are of exactly the same design, though of differing capacities and are mounted on the regular standard Studebaker electric chassis of the sizes and types in question.

STUDEBAKER ELECTRIC TRUCK, MODEL 2126-C, 10,000 POUNDS CAPACITY.

BRIDGING FLORIDA STREAMS FOR AUTO USE.

One of the greatest drawbacks in any country where the roads are not well settled and maintained is the lack of bridges to cross the more or less frequent streams and gullies. The route between St. Augustine and Ormond, Fla., is characterized by quite a number of such bad spots, or at least it was, until Thomas H. White, president of the White Sewing Machine Company, Cleveland, O., and of which the White Automobile Company is an offshoot, undertook to remedy this state of affairs. Mr. White has a winter country home at Daytona and frequently makes the trip from here to St. Augustine. It occurred to him that suitable bridges for automobiles could be made for the great number of small creeks without going to a great expense, and he accordingly went to work and devised what his neighbors have dubbed the "Incomparable White Motor Car Trestle," a sample of which is shown in service by the accompanying photograph.

It is practically two troughs supported by suitable stringers and tied an equal distance apart by cross pieces, this distance corresponding to the tread of a car. Since Mr. White has actively undertaken his work of bridge building, the trip between Ormond and Daytona has lost most of its terrors

THOMAS H. WHITE IN WHITE STEAMER CROSSING TRESTLE.

and more tourists are making it than ever before. In addition to this work, Mr. White has also had the laborers from his estate "brushing" the roads—in other words, freeing them from projecting branches and brush.

RUSHVILLE'S DOCTORS ALL USE AUTOMOBILES.

INDIANAPOLIS, IND., Feb. 3.—According to records in the Secretary of State's office, the city of Rushville, about forty miles east of Indianapolis, has more automobiles in proportion to its size than any other city in Indiana. Incidentally, Rushville is probably the only city in Indiana where 100 per cent. of the physicians use automobiles.

Rushville is the county seat of Rush County, which is said to have the finest farming land in the State. Physicians, business men and citizens use automobiles, and two garages have all the work they can do. There are fifty-five automobiles in the city and one motor cycle, three of the automobiles being electric.

HORSE-DRAWN STATISTICS THAT INDICATE AUTO'S GROWTH

THE United States produced one million and a half horse-drawn vehicles, the majority of them being family and pleasure carriages, during the year 1905, the latest period for which returns are available. Tremendous as has been the growth of the automobile industry, it appears as yet to have had little influence on the growth of the carriage industry, according to complete figures compiled by *Commercial America*. In 1810 the aggregate value of the products of this industry for the whole country was \$1,421,000; by 1880 this had increased to \$65,000,000, and in the fifteen years that have elapsed since that time the value of the products of the carriage and wagon industry has grown until it amounts to \$125,000,000. How this last total has been modified by the automobile it is impossible to say with any degree of certainty, for, owing to the prosperous condition of the country, the two industries have grown concurrently, and have not yet been brought face to face in industrial conflict.

937,000 Carriages Made in 1905.

There were manufactured in 1905 no fewer than 937,000 family and pleasure carriages, most of which remained in the United States, export trade only being a minor feature. Naturally there will always remain a limited number of users who, by preference or supposed economy, will remain true to the horse and buggy, but the total given, which represents a value of \$55,000,000, shows that there is still a tremendous field which the automobile builder may invade and reasonably hope to capture by quicker, cheaper and more economical methods of mechanical transportation.

The most popular of all types of horse-drawn carriage is the buggy, used as much for business as for pleasure purposes. Its use as a pleasure vehicle is probably larger than is generally supposed, as is shown by the fact that when the farmer has had a profitable season the farmers' boys are large purchasers of these vehicles for other than business uses. With road conditions as they stand at present, it is in this field that the automobile builder has the widest possibilities for immediate expansion, with a mechanical vehicle reduced to its simplest forms.

Scope for Auto Conquest in Commercial Field.

There is equal scope for conquest in the commercial field—though the change there is not likely to be effected with the same facility—in the 643,000 wagons for business and farm use turned out in 1905 at a value of \$37,000,000. In addition, 127,000 sleighs and sleds, valued at over \$2,500,000, were produced during the same period. There were also 8,676 carriage bodies, 8,855 wagon bodies, and 389,266 wheels made in the carriage factory. Deducting \$28,000,000, the value of all other products, from the gross value, leaves \$97,000,000

to represent the value of the finished vehicles of all classes. One of the distinctive features of the carriage and wagon industry has been its specialization; whereas in the early days the entire work of manufacturing was done in one establishment, now separate factories make a specialty of the different parts, very few, if any, manufacturers making a complete vehicle.

Establishments Decreased, Capital Increased.

Though the number of establishments has decreased from 6,204 in 1900 to 4,956 in 1905, the amount of capital invested has shown a decided growth and now reaches \$126,320,604. The total cost of material used is estimated at \$61,215,228. In this amount rubber tires figure for \$2,626,889. The following table will give a comparative summary of the statistics of the carriage and wagon industry for the years 1880, 1900 and 1905:

	1905.	1900.	1880.
Number of establishments....	4,956	6,204	3,941
Capital	\$126,320,604	\$109,876,885	\$37,978,493
Salaried officials, clerks, etc....	5,058	4,008	
Salaries	\$5,239,043	\$3,576,915	
Wage-earners, average number	60,722	58,425	45,394
Total wages	\$30,878,229	\$27,578,046	\$18,988,615
Men 16 years and over.....	59,411	57,209	43,680
Wages	\$30,525,515	\$27,264,021	
Women 16 years and over...	870	840	278
Wages	\$266,674	\$248,071	
Children under 16 years....	441	376	1,491
Wages	\$86,040	\$65,954	
Miscellaneous expenses	\$10,182,614	\$5,800,687	
Cost of materials used.....	\$61,215,976	\$53,723,311	\$30,597,086
Value of products, including amount received for repair work	\$125,332,976	\$118,234,950	\$64,951,617

Of the total number of establishments reported in the United States in 1905, 38 per cent. were located in cities having a population of at least 20,000 and the value of their output was \$70,000,000, or 56 per cent. of the total for the United States. In the States, Ohio leads with the greatest value of carriage and wagons for 1905, followed in order by Indiana, New York, Michigan, Illinois and Pennsylvania.

America's Only Foreign Market Competitor.

Exports of carriages, wagons and parts only amounted to \$4,270,000 in 1906, the countries supplied being Argentina, Canada, Mexico, Great Britain, Australia, South Africa and Cuba. America's only competitor in foreign markets is Great Britain, which exported to the value of \$1,540,000 in 1906, or about 70 per cent. of the amount handled by the United States. French exports consist mainly of very fine and expensive carriages, this being the only class of goods in which it competes with the United States.

FIGURES THAT IMPRESS ALL WHO STUDY THEM.

"That automobile popularity is far from waning, as many pessimists have endeavored to make us believe, is strongly contradicted by the registrations with the Secretary of State at Albany during 1907," says S. H. Mora, maker of the Mora car and a member of the American Motor Car Manufacturers' Association. "During 1907 there were 13,980 owners registered and 9,386 registrations for chauffeurs, against 11,649 owners, and 7,335 chauffeurs in 1906. To me these figures are impressive, as they must be to anyone who will study them. It means that the American manufacturer is offering the public the very best car possible to build for the money; or else, the sales of American cars would not have had such an increase during the past year."

7,000 PENNSYLVANIA LICENSES SINCE DEC. 15.

PITTSBURG, Jan. 27.—More than 7,000 automobile licenses have been issued by the automobile division of the State Highway Department of Pennsylvania since December 15. This is a big increase over the corresponding period of 1907.

Automobilists of Western Pennsylvania are agitating a system of uniform signals to be adopted throughout the State. The signals suggested are as follows: One blast: "I am going straight ahead"; two blasts: "I am turning to the right"; three blasts: "I am turning to the left"; four blasts to mean: "Your lamp is out"; five blasts to mean: "Do you require help?"; two and one to mean: "Yes"; two and two to mean: "No." Such a system of signaling would doubtless be of value if automobilists can be induced to adopt it unanimously.

Hailing the Small Runabout with Enthusiasm. So much success attended the privately organized races for small runabouts last year that the Automobile Club of France has decided to precede its annual race for the Grand Prix by a speed contest limited to this class of diminutive automobile. Apparently the movement will not stop here, for there is already a distinct demand in English automobile circles for a race of a similar nature.

The class of machine which it is sought to popularize and develop is a little two-seater with an engine not exceeding 3.9 inches bore for a single cylinder, or, roughly, fifteen horsepower. As America has already proved in two or three notable instances, there is an almost unlimited demand for a popular machine of this nature, selling from five hundred to one thousand dollars; the demand, too, will be confined not to one or two countries, but to every land where roads exist. It is surprising, therefore, that greater official attention has not been paid to such an important section of the automobile industry. In France it was necessary that there should be serious indications of the limit of expansibility in the large car trade before whole-hearted attention was paid to the popular runabout. Once realized, however, there has been no delay in entering into what promises to be a field of activity that will equal the trade in automobiles de luxe.

It would be interesting to see the one American constructor who has resolutely invaded Europe with a four-cylinder runabout lined up against the products of the old world. Despatches received from across the Atlantic ap-

pear to indicate that the representative of the firm in question will not race because the limited bore makes it impossible to put in the stock American car. It is for the manufacturer alone to say whether it is worth while to construct special baby racers; it is certain, however, that the American industry would gain more at home and abroad by participation in races of this nature, or organizing contests on similar lines, than in running in expensive high speed tests.

Expanding the Market for American Automobiles. In beginning this with the title given, there is no intention of further dwelling upon that subject, which is being so constantly brought up—the benefit to be derived from seeking export outlets—but rather to call attention to one phase of the influence of the comparatively new buggyabout that appears to have been generally overlooked. Cars of this type have been on the market for several years, but it is only within the past two or three that they have assumed any great importance. It is evident that the car selling for a few hundred dollars cannot be marketed profitably by the same selling methods that characterize the disposal of \$5,000 cars. To give proportionate returns, the sales must be large, so that the average dealer accustomed to handling larger cars is naturally not over-enthusiastic about the buggy type.

Here is the carriage dealer's opportunity, and there appears to be little doubt that this trade as a class recognizes the value of the opening and will take advantage of it, particularly as the far-sighted ones in this business have long been feeling the influence of the automobile and have wished to get in line with the advanced movement rather than array themselves against what they knew was inevitable. In this manner the number of automobile agencies in the country will be increased by thousands of new dealers in a short space of time, nor is it to be anticipated that with a little experience such dealers will confine themselves to the smallest cars, so that in the course of a year or two the sales of American cars at home should expand greatly by reason of the number of people selling them, even if no other cause were present. It marks a long step forward in the education of the public to the automobile.

New York-Paris Run Will Be a Good Educator. In ten days the world will have an opportunity of making a comparative inspection of the machines intended for the longest and most exacting automobile tour ever conceived by an imaginative Gallic mind. The six foreigners being already in mid-Atlantic may be considered certain starters, and four of them at least appear to have been constructed and fitted out with a determination to go through to the end. Though so near at hand, practically nothing is known of the four American cars, still announced as being ready to line up in Times Square on February 15. A sufficient explanation for the smallness of the home contingent is to be found in the briefness of the period between the announcement of the event and its practical execution. But inspiration cannot be forced, and it would be unreasonable to demand an exception of the *Matin* publicist.

When everything has been said on the uselessness, the foolhardiness, the absurdity of the New York-Paris automobile tour—and enough could be said to fill the ample columns of both journals interested in its execution—the fact remains that it will have a general educative value unequalled by any other demonstration. Automobile construction is not likely to profit one iota, but the automobile industry throughout the world will benefit by an immense publicity which could not have been obtained in any other manner. For three months the eyes of the entire world will be focused on the small group of cars, and the world cannot but be impressed by what the automobile is capable of doing.

TWO-CYCLE VS. FOUR-CYCLE IN GRAND PRIX RACE

PARIS, Jan. 27.—The voiturette race to precede the French Grand Prix will probably see the inauguration of the two-cycle motor as a racer. The club having decided to allow two-cycle motors to compete in both events under the same conditions as those of the four-cycle type, four firms at least have made the announcement that they will enter the small car race with single-cylinder two-cycle motors of 3.9 inches bore. Instead of 15-horsepower, which is about the maximum from a 3.9-inch four-cycle engine, it is calculated that 18 or 20 horsepower will be obtainable from the two-cycle competitors. The event will be watched with considerable interest, for should a two-cycle win, or even make a good showing, the popularity of this type of engine will be enormously advanced. Isotta-Fraschini, the first official entrants in the Voiturette Grand Prix, announce that their cars will have four-cylinder four-cycle engines of 2.4-inch bore.

Ford participation in the small Grand Prix race is under consideration, but has not yet been definitely decided upon. Henri Dépasse, who recently undertook the exclusive agency in France for the popular four-cylinder American runabout, declares that he would be glad to take part in the race if the rules allowed his 3.7 bore engine to compete. It is not likely that there will be any change in the rules of this or any of the succeeding voiturette races which would allow the Ford to compete, and the only possibility of making a demonstration against European cars would be by constructing special racers. One hundred millimeters bore for a single cylinder—equivalent to 3.9 inches—is considered the limit for a small runabout in France, and although nobody denies that the little Ford is a runabout, it is not allowed to line up with its smaller European rivals under present rules.

Victor Breyer, who last year so ably managed the French Grand Prix that the Racing Board found itself with a large balance in hand at the end of the race, has been succeeded by Georges Desson, the organizer of the Gordon Bennett race

of 1905 and other sporting events of lesser importance. The change of management is not due to any dissatisfaction with the work of the previous délégué général, but has been prompted by a desire to give other favorites a share in the work. Under the new régime, which aims at making a financial success of the Grand Prix, the general manager will have a more difficult task on the popular circuit likely to be adopted than in distant and wild Auvergne.

Dieppe offers \$10,000 and a remade set of roads to have the race in its district. The amount is only half that of last year, but the Dieppe authorities refuse to hand out another cent. Probably the Racing Board would accept their offer if the land adjoining the course had not gone up enormously in value. It would have been cheaper for the club to have bought it outright a year ago than to pay the price that is now being asked for three or four days' rent. Owing to this, other districts are being examined.

Maurice Farman, brother of Henry Farman, of aeronautical fame, has been selected to drive one of the Panhard racers in the Grand Prix. His companions will be George Heath and Cissac, the well-known motorcyclist.

Discussion has been aroused by S. F. Edge's attack on the Grand Prix rule forbidding the changing of wheels. England's greatest publicity expert declares that though he has three six-cylinder cars ready for the Grand Prix he will not enter them as long as the rule against changing of wheels remains in force. Dismountable rims are allowed under the racing rules, but dismountable wheels are forbidden. As it is this latter type that Edge has always employed on his racers at Brooklands track, he sees in the rules of the French club an attack on the British industry, and strikes back with all the vigor of his vigorous pen. Refusing to enter the road race without his own type of dismountable wire wheel, he challenges René de Knyff, of the Panhard firm, to a special track race, and has deposited \$1,250 stakes with the Brooklands club for such an event.

RHODE ISLAND LAW HAS MANY FEATURES.

PROVIDENCE, Feb. 3.—The new automobile law about to be presented to the General Assembly is unique in that it has the practically unanimous support of the people of the entire State. It is the work of the special legal committee of the Rhode Island Automobile Club, consisting of Dr. Julian A. Chase, Col. Frank W. Tillinghast and J. Jerome Hahn, and contains a number of new features.

The penalties have been made severe, ranging from a fine of \$10 to \$500, or imprisonment from 10 days to one year, or both, for the violation of any of the provisions of the bill. It is also made an offence for the driver of a car to leave the scene of an accident in which he was concerned without giving his name and address to some person connected with the person or property injured or damaged. When left standing all cars must be so locked as not to be operated by any unauthorized person. All money received from fees is to go to the support or improvement of the roads, the charge being \$2 for registration and the same amount for drivers' licenses.

Section 10 of the new bill is a reciprocal provision aimed at those States which do not permit the driving of a car on their roads by a non-resident without taking out a license, and provides that only non-residents of States that recognize Rhode Island licenses shall be immune from the operation of the new law for a period corresponding to that allowed to outsiders by their home States.

BAY STATE AUTOISTS OFFER REWARDS.

BOSTON, Feb. 3.—Never have local automobilists been aroused over the wrongdoing of one of their own fraternity as they are at present on account of the action of a driver in running away after striking a little girl in the town of Milton, one of the suburbs of Boston. According to witnesses the accident was unavoidable, but the driver, after carrying her to the door of her home, drove away without revealing his identity. As soon as the circumstances became known the Bay State Automobile Association offered a reward of \$50 for the conviction of the party responsible. The Automobile Owners' Association has added \$100 more and Frank J. Tyler of the Maxwell-Briscoe Boston company offered an additional \$50. Then Charles S. Henshaw of the Haynes company offered \$25 and the Safe Roads Automobile Association announced that its standing reward in such cases is \$50. Thus the aggregate reward now amounts to \$275. This case will undoubtedly do much to aid in the passage of a bill now before the Legislature designed to cover just such accidents. At present even if the responsible autoist or autoists are caught, it is doubtful if they could be successfully prosecuted, and there is no penalty for running away, except possible revocation of the license. The bill referred to makes running away after an accident punishable the same as reckless driving or operating while under the influence of intoxicating liquor, the punishment for which is a fine not exceeding \$100 or imprisonment for not more than six months.

AUTOING THROUGH THE ISLAND OF SUGAR.

(Continued from page 170)

of way goes up and down over clay banks and is thickly covered with rank grass concealing all kinds of stones, bumps and hollows. Then imagine a motor trip over it and you will have a fair idea of the best road we struck for many a toilsome league. A league, by the way, is the universal standard of measure in Cuba, and it means nothing in the mind of the man who tries to tell you how far it is to somewhere. The average country Cuban has never been further than a few miles from his own home.

We managed to get away off the route, and miss the towns we expected and find others we did not want. Toward the close of the afternoon we learned that we were cutting across fields and over unused trails and along forgotten highways to Esperanza, so we knew that we would then be on the way to Santa Clara. The rivers were close together. We forded nine that day, including some where the climbs up the far bank were so steep that if named in grade per cent. would not be believed.

We Slip Into a Bog.

Nightfall caught us in the one-too-many bog—a wide one into which we had slipped off the edge of a ridge. The car sank to its axles. Luckily we were in a region of stone fences. Jacking up one wheel at a time with stone fulcrums and saplings for levers, we built a rock foundation under each. Some Cuban farmers came along and helped us. Under the leadership of a lean, wiry individual they hustled with amazing energy. Through the night rang the quick: "Espere un poco!" and the commanding "A un tiempo!" directing the movements of the men on the ends of the levers. When the car had a foothold, the motor was started, and, with a great upheaval of rock and mud, jumped to the hard ground, the interested natives let out a loud yell of approval and the wiry one shouted:

"El Toro! El Toro!" Thus the car got its nick-name.

Some more smaller mud holes, then a hill hewn roughly out of the native rock, and climbed slowly to the dark, and we drove into Santa Clara, proudly directed to the hotel by one of the Cubans who had come along as guide. He was soon the center of an eager crowd and probably told fearful and wonderful tales of this automobile in which he, among all Cubans of the province, had been the one to ride.

Rest of Tour in the Rain.

The rest of the tour was in the rain. Roads which had been fairly good when dry turned to slippery rinks of red mud. Ruts which could be ridden on the ridges during dry weather could be taken only by the most careful driving and arduous road picking. Ravines were so slippery that it seemed worse than foolhardy to try to either ascend or descend. Rivers rose. Bogs and swamps were turned into streams of soft mud. At each one we had to stop to find out if the bottom were hard or soft. We had profited by experience. A hard bottom one we took by "shooting it," a process which explains itself. The deep, wide, treacherous swamps we bridged with rough corduroy roads of palm trunks and underbrush. It was hard work. We forded three mountain rivers, for now we were in the Santa Fé mountains and were glad when, at the top of the struggling ascent up the rain-washed pass, we found a shelter and something to eat in a little grocery annex to the home of a farmer. Waldon bunked on a bench, with the seat cushions for mattress and fleas for company. The rest were on cots or in hammocks. The night was cold. We were stiff in the morning when we looked out on another day of rain and a perspective of mountain ridges, gullies, rivers and lowland sloughs. Until noon we worked getting over the three miles to Camajuani. This meant two rivers, hills and innumerable swamps. The engineering department, armed with axe, shovel and mattock, worked ahead and every inch of the way we repeated the

cablegram we had received at Santa Clara from the general manager: "Have a good time."

The rest of the day was a continuance of the same thing and we made one less mile than the day before—thirteen instead of fourteen. At night we were still "shooting," dodging or fighting through mud holes and quit the day's work at a sugar plantation. We had supper in the laborers' eating house and slept on the same table. We dried our clothes over the kitchen fire, and laughed at each other and recited our experiences of the day.

We hit Placetas early the next morning, and found that we had made a needless trip through the Santa Fé mountains. We should have cut straight across from Santa Clara and left Camajuani and Camajuani river peacefully unaware of our existence. So we promptly left Placetas by the wrong road and at noon discovered we had made a goodly number of hard-earned, rain-soaked miles back towards Santa Clara. Twenty-seven miles altogether brought us to a tobacco plantation, and we were taken in.

That was a wonderful supper—the best we had had. Potage of beans, other vegetables and meat; fish, guinea, rice, fried potatoes—we were hungry and we ate voraciously under the eyes of *senor*, *senora*, *senorita*, and the children who were under the clothes age limit. Then we discussed ourselves and marveled at the racking we had given "El Toro," marveled at the way the tire casings had stood the abuse on the rocks, marveled at the feats of rough and ready road engineering and motor car driving which had been performed. Meanwhile *senora* slung hammocks for us, and when we went to them, lo, they were in a thatch-roofed pig pen! So we counted the eight pigs in the glare of a side lamp and chanted the glad refrain of that cablegram:

"Have a good time!"

Country Soaked to the Marrow.

The last day—if we could make the 28 miles to Sancti Spiritus in one stretch of daylight. Ahead we could always see the mighty Tuerto, flanked by Cabellete de Casa and La Gloria. The whole country was soaked to the marrow. The farmers told us that this rain was a delayed wet season. It seemed to us to be the real article. With the tonneau a mud-soaked mess of road tools, canned food, grips and blankets; with all but the driver on the running boards when we were not all out in the road shoveling, carrying stones or prospecting, we worked by right road and wrong road toward the town Guayos, where we debated whether we should stay for the night or take a chance of finishing it up rain or shine, muddy or dry, hills and rivers be damned. A Cuban rural guard said that just over the next hill started a good road stretching to Sancti Spiritus. That next hill was like tomorrow, which never comes. Up one steep ascent of yellow clay, running with water, and so slippery that even the few sure-footed Cuban ponies which we met slid, sprawled and fell; down again and up, always looking for that promised road "over the next hill." We found it just outside of Sancti Spiritus, and the whole population of that city is still telling of how they flocked into the narrow streets to see the arrival of the automobile.

There is more to tell—the little things which were big at the time; the funny things and the hardships; the people, their homes, their country and their ways; the experiences in the towns and the disappointments in the country. There was so much to tell that each new hour's experience drove almost from mind that of the previous hour. One thing we had always in mind. We had done what we had been told could not be done; we had traveled where no other four-wheeled vehicle had ever traveled; we had conquered in our Packard "Thirty" the alleged impassable obstructions of the wild interior of Cuba—we had made good and did not care a rap that we had no clean clothes in which to appear before the elite of Sancti Spiritus.

E. R. S.

JOE TRACY, WITH A SIMPLEX, INVESTIGATING THE BRIARCLIFF COURSE, WHICH HE SAYS WILL TEST A CAR'S DURABILITY.

BRIARCLIFF ENTRIES NOW NUMBER NINETEEN.

Entries for the Briarcliff Trophy race are closed—officially at any rate. Whether others will be allowed to come in after the door has been reluctantly locked and barred is difficult to determine. "We have \$9,500 in the bank," declared Thomas Francis Moore, secretary of the race. As each car must pay \$500 entrance fee on account, a little mental arithmetic brings the number of engagements to 19. To assure success and safety it had been determined to limit the entries to 30, but in view of the shortage a different problem presents itself. Says Manager Moore: "The Manufacturers' Association has decided to accept additional entries at an increasing fee each week until the total is made up. They also gave Robert Lee Morrell power to act as he thought best, and his opinion is that no more entries should be received, in justice to those already engaged."

Chairman Robert Lee Morrell, interviewed on the situation, said: "The entry lists are closed; but if anybody else wants to come in, let him send his application along and it will be considered by the present contestants."

The list of entries as given out is as follows:

H.P.	Car.	Owner.	Driver.
30.	Hol-Tan	C. H. Tangeman	Basle
30.	Stearns	H. W. Whipple	Oldfield
30.	Stearns	F. B. Stearns	Leland
30.	Stearns	Wyckoff, Church & Partridge	Vaughan
50.	Simplex	Palmer & Singer	Tracy
35.	Allen-Kingston	A. Hammerstein	Campbell
50.	Lozier	H. A. Lozier	Michener
50.	Lozier	H. A. Lozier	Mulford
50.	Thomas Flyer	S. A. Houpt	Roberts
50.	Apperson	S. B. Bowman	
50.	Isotta-Fraschini	C. Hamilton	Poole
50.	Isotta-Fraschini	C. Hamilton	Harding
50.	Isotta-Fraschini	J. H. Tyson	Strang
30.	Flat	E. R. Hollander	Cedriano
30.	Flat	E. R. Hollander	Ryall
30.	Renault	Paul Lacroix	Bernin
50.	Panhard	A. Massenat	Robertson
50.	Panhard	A. Massenat	
35.	Maja	J. J. Brown	Murphy

No Locomobile in Briarcliff Event.

BRIDGEPORT, CONN., Feb. 3.—In spite of current reports to the contrary, the Locomobile Company announces that it has not planned to enter a car in the Briarcliff trophy race to be held in Westchester in April next. This decision is not based on any unfavorable attitude toward the event, but coming as it does when the entire factory force is engaged in turning out cars, the makers do not wish to have the daily routine of their operations seriously disturbed at such a critical season.

SAVANNAH MEET PROMISES GREAT SUCCESS.

Three Appersons, one Premier, and two Isotta-Fraschini cars are now entered for the road races to be held on the Savannah course, March 18 and 19, under the auspices of the Savannah Automobile Club and the A. A. A. Harding and Poole will probably handle the Isotta cars, and George Robertson and H. H. Van Tine will be given charge of the two Apperson "Jackrabbits." From inquiries made regarding the race, entries are likely to be large, and the enthusiastic co-operation of the district is already assured. Among those who have recently visited the course are representatives from Dragon, Stearns, and Mitchell, and Continental and Michelin tire factories.

According to reports from the Savannah Automobile Club, several hundred convicts, who are the roadmakers of the South, have been put to work on the course.

The Savannah Challenge Trophy, to be presented to the winner of the 360 miles stock chassis race, will be a life-sized bust of Tomachichi, chief of the Yumacrew tribe of Indians, and a personal friend of General Oglethorpe, founder of the city of Savannah. A roughly carved granite monument to Chief Tomachichi occupies a position in one of the public squares of Savannah, and it is a reproduction of this in silver which is intended. The war bonnet, which is a string of feathers, is so arranged that extra feathers can be inserted in it. As the trophy must be won three times before becoming the property of any manufacturer, each winner will receive a silver feather with particulars of the victory engraved upon it, and a duplicate feather will be put in the head gear of the chief. The Southern Runabout Cup and the Southern Six-cylinder Cup will become the property of the winners.

NINE MORE DAYS FOR ORMOND ENTRIES.

Nine days remain in which entries for the Ormond-Daytona beach races may be made to the Automobile Club of America. W. Gould Brokaw has put in the Christie front-drive racer; the Fiat Cyclone, a recent arrival from the Italian factory, has been entered, and Haynes and Renault have each engaged a racer, the French car to be handled by Bernin. The Maxwell twelve-cylinder racer is considered a possible starter. The race for the Dewar Trophy has been removed, and a one-mile straightaway substituted, the qualifying long-distance clause being retained. David Bruce Brown has entered in the amateur event.

RHODE ISLAND HAS A FINE SHOW.

PROVIDENCE, R. I., Feb. 3.—Over a hundred automobiles with their highly polished metal trimmings and many colored enameled bodies reflected the rays of a thousand lights in the new State Armory when the first Providence show was thrown open to the public last Saturday night. The weather conditions on the opening night were wretched, but in spite of the elements several thousand persons filled every aisle and thronged through the spaces reserved for the exhibitors, admiring the rich displays and tasteful decoration scheme which gave them a perfect setting.

The mammoth auditorium, or drill hall, of the armory, large enough to provide room for an entire regiment to be drawn up in order, is divided into three main aisles running the length of the hall, while other broad avenues cross the exhibition room at each end. All of the floor, excepting that portion taken up by the aisles, has been covered with green carpet bordered with dark red, while the exhibition spaces are defined by strips of dark red, which adds a touch of color to the floor decorative scheme. Tall slender palms mark the corners of the several spaces, while overhead are hangings of green and red burlap, forming a frame to mark the boundaries of the stalls. Huge American flags are suspended from the lofty girders, while flags of all nations are tastefully draped beneath. Both balconies have buff and blue striped bunting hung from the railing, while in the background are huge paintings and the national colors.

The automobile show affords the people of Rhode Island the first opportunity to view the interior of the State's newest public building, and the great auditorium, 270 feet long and 170 feet wide, has been transformed into a fairyland such as has never before been seen in the State.

Models of the foremost makes of automobiles are on exhibition, the total number being 120 separate cars, with over 40 concerns represented. Herewith is the car list:

- American Locomotive Car (Berliet): American Locomotive Automobile Company
- American: W. A. Fredericks Company
- Atlas: Crane Automobile & Garage Company
- Buick: Davis Automobile Company
- Cadillac: Davis Automobile Company
- Corbin: Arthur S. Lee
- Elmore: Pugh Bros.
- Ford: Providence Motor Car Company
- Franklin: Dauer Automobile Company
- Glide: Crown Motor Car Company, Boston
- Grout: Aetna Bottle & Stopper Company
- Jackson: C. M. Linton
- Kiblinger: Crown Motor Car Company, Boston
- Knox: Foss-Hughes Motor Car Company
- Locomobile: Davis Automobile Company
- Marion: W. A. Fredericks Company
- Marmon: Frank E. Wing, Boston, Mass.
- Maxwell: Aetna Bottle & Stopper Company
- Mitchell: William A. Harris Steam Engine Company
- Northern: Edgewood Automobile Company
- Oldsmobile: Davis Automobile Company
- Overland: W. A. Fredericks Company
- Packard: Flint Motor Car Company
- Peerless: Davis Automobile Company
- Pierce-Arrow: Foss-Hughes Motor Car Company
- Premier: J. O'Donnell
- Rambler: Whitten Motor Vehicle Company
- Reo: William Hughes Company
- Royal-Tourist: Arthur S. Lee
- Stanley: Central Automobile Exchange
- Stevens-Duryea: Snow Automobile Company
- Stoddard-Dayton: Nock Automobile Company
- Studebaker: Pawtucket Automobile Company
- Thomas: Davis Automobile Company
- Weich: C. M. Linton
- White: Central Automobile Exchange
- Winton: Davis Automobile Company

COMMERCIAL TRUCKS.

- American Locomotive Automobile Company
- Foss-Hughes Company

The accessory list is lengthy and as follows:

- The Villers Company.....Optical supplies
- Thompson Art Company, Portland, Me.....
- Belcher & Loomis Hardware Company.....Marine supplies
- The Angler Company.....Accessories
- Aspinwall Hardware Company.....Marine supplies
- William A. Harris Steam Engine Company...Engines
- Walte Auto Supply Company.....Accessories
- A. W. Harris Oil Company.....Oils
- Blanding & Blanding.....Cigars
- John A. Gammons.....Automobile Insurance
- Nonparell Brass Company.....Accessories
- Visor Knitting Company, Niagara Falls, N. Y. Caps

- Welch Grape Juice Company Motor Car Specialty
- Spare Wheel Company, Ltd. Atlantic Boat Company
- Mlanus Motor Works New England Automobile Journ.
- Modox Company Providence Tribune

CENTRIFUGAL PRINCIPLE OF THE VEEDER.

Editor THE AUTOMOBILE:

In your issue of January 30 we notice that you have given publicity to an article concerning speed indicators of centrifugal types.

The Veeder Manufacturing Company manufactures a speed indicator called the Veeder Tachodometer, which depends on the centrifugal principle, but not on the position of a revolving weight. It is well known to anyone who has investigated the matter, that a speed indicator built by having for the moving force weights which take different positions according to the centrifugal force developed by the speed of the instrument, will, by the nature of the instrument itself, give more movement for a low speed than for a high speed. This is corrected in almost all these instruments by a cam.

The Veeder Tachodometer does not use any cam to adjust the graduations on the scale so as to make them even. On the contrary, the graduations are closer at the low speeds than at the high speed. This is a very desirable item, as it renders the instrument much more easy to read at a high speed than at a low speed, and it is when running at a high speed that one needs to read the instrument at a glance. If the graduations are all even, they are no more easily read when one is going 60 miles an hour than when one is going 10 miles an hour. A car running at 60 miles an hour, however, requires nearly all of the attention of the driver, and he should not be compelled to spend much time to determine his exact speed. For this reason the Veeder Tachodometer is very much more desirable as a speed indicator than any instrument having an evenly graduated scale, and exceedingly more desirable than an instrument which has closer graduations for the high speeds.

It is not claimed that the Veeder Tachodometer is absolutely accurate. Such a claim is on the face of it absurd. It is claimed, however, that this instrument is accurate within an error of one per cent. There are no parts of the instrument subject to wear, which would tend to make it inaccurate after a period of use. It has ball bearings throughout, and the only part which moves is the paddle which imparts motion to the liquid in the instrument. For this reason the instrument might be used for ten years and at the end of that time show no greater inaccuracy than when it was first made. This could not be true of any purely mechanical instrument, because the wear on such an instrument does cause an appreciable increase in the error.

Any instrument in which a cam is used wears out of accuracy more rapidly than if the wear were simply on the bearings. A cam will always wear in spots, either because of inequalities of the structure of the material of which it is made, or because of inequalities in the forces which act upon it at different times. These objections have been overcome in the Veeder instrument, and for this reason it is by all odds the most accurate and reliable instrument for speed indicating now on the market.

THE VEEDER MANUFACTURING COMPANY,

Hartford, Conn.

A. Trowbridge.

PLACE TO CARRY LIGHTS; HOW TO TRUE THEM.

Editor THE AUTOMOBILE:

Replying to your letter (1,143) as regards the "Position of Automobile Headlights," the writer has experimented as to the best place to carry the gas headlights, and, after trying all positions, we have found that where they are now put is, everything considered, the proper place.

The fault your correspondent speaks of, that is, of magnifying small inequalities, is caused by the rays from his lamp striking the ground at too much of an angle, and if he will tilt his lamp upward this defect will disappear.

The idea of placing lamps on the fender is all right, provided the lamp is placed so that the rays do not strike the fender. If they do, one will have a nice large shadow reproduction of the fender, that is anything but a help.

Manufacturers and users are not at all careful about "truing" up lamp brackets. We have noticed a great many cars driven by men who ought to know better, with headlights pointing anywhere than where they should. The proper way to "true up" headlights is to drive to within 25 feet of a blank wall and then adjust lamp brackets so that the lamps will throw the rays straight ahead.

Amesbury, Mass.

GRAY & DAVID.

H. A. KNOX TALKS TO A. C. A. ON TWO-CYCLE.

At the Automobile Club of America on Tuesday evening last, Harry A. Knox, president of the Atlas Motor Car Company, of Springfield, Mass., delivered a lecture on the subject of the two-cycle motor and its possibilities on the automobile, particularly with reference to the Atlas motor which his company builds, and which has proved very successful. In the gathering were many of the pioneer members of the club who, in the past seven or eight years, have had experience with almost every type of automobile built, so that when President Colgate Hoyt introduced Mr. Knox, he found an attentive and well-informed circle of listeners. The lecture was more in the nature of an informal talk than a set technical paper on the subject of the two-cycle motor, and Mr. Knox illustrated his points with the aid of the component parts of one cylinder of an Atlas motor.

Mr. Knox concisely pointed out the advantages and disadvantages of the two and four-cycle types by impartially comparing them, and showing that while the former had not, up to recently, rewarded the efforts of investigators as they had anticipated, this did not affect the possibilities of the two-cycle motor, and that it only required the proper application of its principles to reap the numerous benefits of simplicity and efficiency which this type held out. Numerous questions were asked of the lecturer, which led to a very interesting discussion.

OLDSMOBILE "MUDLARK" PLUGGING SOUTHWARD.

COLUMBUS, O., Jan. 31.—Ralph Owen, who is driving his 40-horsepower Oldsmobile *Mudlark* on the 2,000-mile midwinter trip from New York to New Orleans, arrived here to-night covered with mud from tires to top. Owen reports the roads from Buffalo to Cleveland to have been almost impassable owing to snow banks and ice driven into the roadway from the frozen surface of Lake Erie. This is the first automobile to attempt the trip to New Orleans from any of the Northern cities.

Owen left last Sunday, and expects to arrive in New Orleans February 14. If the schedule which he has been able to maintain up to date is approximated from now on he will be able to finish the 2,000 miles by that date. The *Mudlark* is fitted with Diamond tires.

AN ANTI-AUTO RACING N. Y. ASSEMBLYMAN.

ALBANY, N. Y., Feb. 5.—Assemblyman Yale, of Putnam County, to-day introduced a bill repealing sub-division 6, article III, of the present motor vehicle law, which provides that "local authorities may, notwithstanding the other provisions of this act, set aside for a given time a specified portion of the highway for speed tests and races." Assemblyman Yale says State Engineer Skene favors the bill on the ground that racing automobiles tear up the good roads.

Assemblyman Fowler, of Ulster County, has introduced a bill providing for an annual registration fee, based on the weight of a motor vehicle, such rate to be 50 cents per 100 pounds.

TAXICAB SERVICE FOR THE CAPITOL CITY.

WASHINGTON, D. C., Feb. 2.—Application has been made to the District Commissioners by the Thomas Taxicab Company for a license to operate a system of taximeter automobile cabs in this city. Robert A. Parke, who represented the E. R. Thomas Motor Company, of Buffalo, N. Y., is spending several days in Washington, in order to formulate plans for the proposed service, and it is expected E. R. Thomas will be here during the week to assist in the work. The system will be put into operation about March 1, if the company meets with no opposition.

LONG ISLANDERS TO HOLD ECONOMY RUN.

BROOKLYN, Feb. 4.—A one-day midwinter economy test from Brooklyn to Montauk and return will be held by the Long Island Automobile Club on Tuesday, February 25. Gasoline and lubricating oil will be supplied in sealed cans to each contestant at a price basis of 25 cents per gallon for the former and \$1 for the latter. The winner will be the car which carries its full quota of passengers and official observer over the 242 miles at the lowest cost for each person, fuel and oil only to be considered. A comparison with railroad rates will be made. There will be no penalties for repairs or adjustments on cars or tires, but contestants must conform to a time limit to be determined the night before according to road conditions. Entry fee is \$25 for the first, \$15 for the second, and \$10 for the third car, entries closing on February 20, or at 6 P. M. on February 24, on payment of a penalty of \$10. The club reserves the right to abandon the contest if at least 25 entries have not been received at the regular time of closing, or to postpone the run if snow on the road should made them impassable. Final instructions will be given at a meeting of contestants and officials at the L. I. A. C. clubhouse. Cars may be left in the garage all night if desired. The contest committee consists of Arthur R. Pardington, chairman; C. G. Arnold, and F. D. Bاندell. Russell A. Field, the club secretary, announces that the entry blanks will be published immediately, and can be obtained at club headquarters, 360 Cumberland street, Brooklyn, or will be mailed to intending entrants upon request.

C. L. GOODHUE NOW HEADS KNOX COMPANY.

SPRINGFIELD, MASS., Feb. 3.—The long-anticipated reorganization of the Knox Automobile Company, of this city, which made a voluntary assignment for the benefit of its creditors in July, 1907, was effected at a meeting of the directors on February 1. As a result Charles L. Goodhue was elected president, succeeding E. H. Cutler, while William E. Wright was reelected vice-president. Mr. Goodhue was also elected treasurer of the company, succeeding Albert E. Smith, who resigned from the directorate, together with E. H. Cutler, H. F. Farr and G. W. Bennett. The new directors are Charles H. Beckwith, Alfred N. Mayo, Charles L. Goodhue, Peter Murray and William E. Wright, Springfield; Clarence E. Whitney, Hartford; W. H. Chase, Leominster; M. J. Greenwood, Gardner, and H. W. Cutler, North Wilbraham.

The company's assignment was brought about by a lack of capital and the pressing need for ready money at the time, and the plan for reorganization includes the issuance of \$500,000 in preferred stock to the creditors of the company, which is practically a capitalization of the concern's indebtedness. Conforming to this plan, the management has been handed over to the preferred stockholders, or, in other words, the creditors, which accounts for the numerous changes in the officers and directorate. Alfred N. Mayo has acted as trustee for the company since the assignment, and there has been a considerable increase in its sales during the interim, so that a larger business than ever is confidently anticipated during the coming year, now that the temporary financial tangle has been settled to the satisfaction of all concerned.

MANAGER APPOINTED FOR AUTO CARNIVAL.

Thomas Francis Moore has been appointed manager of the automobile carnival which the New York Automobile Trade Association intends to hold during the week beginning April 6. The appointment was made at a recent meeting of the association at the Hotel Cumberland. Features of the carnival already decided upon are a parade on Tuesday, April 6, and various gymkhana games and contests.

FRANKLIN NON-STOP CAR ON A MARYLAND ROAD.

FRANKLIN MAKES A COLD-WEATHER RUN.

WASHINGTON, D. C., Feb. 3.—New honors have just been won by a Model Franklin in completing a 96-hour non-stop run, 500 miles of which was made on the road and the remaining 1,300 miles in the garage. At 11:34 o'clock, Tuesday morning, Jan. 28, the car left the city and covered the route of the recent sealed bonnet contest of the Automobile Club of Washington, which embraces 125 miles of road that is in very poor shape when the weather is bad. At the conclusion of each day's run the car was placed in a glass case in the garage of the Cook & Stoddard Company, Franklin agents, and there were various shifts of observers to see that the engine was kept running. The car was piloted alternately by J. H. Dailey, holder of the San Francisco-New York and Chicago-New York records, made in Franklin cars, and F. S. Bliven, of the Cook & Stoddard Co.

During the course of Friday's run Dailey was unfortunate to encounter a farmer riding a horse. The latter became scared at the car and proceeded to bolt. The car was stopped and Dailey tried to pacify the farmer. The latter insisted on his stopping the engine, but as this would defeat his project, Dailey declined to accede. A constable arrested the entire party and took them to Lima, Md., where a magistrate fined Dailey \$47 and costs, but the latter telephoned the State's Attorney. He advised the magistrate that he had exceeded his rights and that the highest fine he could assess was \$5 and costs. At the expiration of the ninety-sixth hour President Caverly of the Automobile Club of Washington formally brought the run to an end.

NEW 12-CYLINDER MAXWELL CHALLENGER WITH DESIGNER MAXWELL AT WHEEL.

THE GOODRICH GIRL FOR 1908.

"Sally is an heiress," that is the Goodrich Sally, who is the charming feminine representative that the Akron rubber house greets its friends with every year. The original is done in oil, and the large size reproductions on heavy plate paper ready for framing that are sent out by the B. F. Goodrich Company are quite worthy of the large and annually increasing family of Goodrich girls. To quote from the company's announcement, it may be added that "Sally is heiress to a mint of suggestions (all Goodrich rubber)."

WHERE PREST-O-LITE TANKS ARE CHARGED.

Plant Number 5, while not the latest addition to the manufacturing facilities of the Prest-O-Lite Company, is a recently completed building put up by this firm at Indianapolis, Ind. The building measures 200 by 700 feet, and is two stories high, besides a basement, thus giving 28,000 square feet of available floor space. The construction throughout is of the latest type of steel and reinforced concrete, thus making

PREST-O-LITE FACTORY NO. 5, AT INDIANAPOLIS.

it absolutely fireproof. It has been in operation since the beginning of the year and is one of the largest of its kind in the country, having a capacity of 2,000 Prest-O-Lite acetylene gas cylinders daily.

TWELVE-CYLINDER MAXWELL AFTER FREACKS.

The twelve-cylinder 180-horsepower Maxwell racer is out for a special test of speed against all comers. The Sir Thomas Dewar trophy race would have given the opportunity desired, had that event been retained on the Ormond-Daytona program. This speed test having been withdrawn, the Maxwell-Briscoe people have written to Robert Lee Morrell, chairman of the contest committee of the A. C. A., asking him to issue a challenge on their behalf to the Stanley steamer or any other fast car, for a race to be held either during or immediately after the Florida beach tournament. It is declared that, with the consent of the trophy trustees, the twelve-cylinder Maxwell will be held in readiness at any time during the meet to start against all comers.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Beck & Clausel, 204 Cox avenue, Memphis, Tenn., are about to put a new car on the market after designs of A. C. Menges, late of Grand Rapids, Mich., and though all details have not been definitely settled a four-cylinder car of medium price, high power and light weight will be made.

The Detroit branch of the G & J Tire Company will remove at once from 247 Jefferson avenue to 256 Jefferson avenue and occupy part of the Hartford Rubber Works Company branch store at that number. The individuality of the two concerns will, of course, be maintained, H. C. Severance continuing as manager of the Hartford Rubber Works Company and Charles S. Monson of the G & J Tire Company.

Holsman cars are not built primarily for speed, but that they can hold up their end in this respect when necessary is amply evidenced by the fast trip from Winslow, Neb., to Fremont, made by President Weitkamp of the Bank of Winslow recently. He left Winslow in his Holsman a few minutes after the departure of the regular train and succeeded in overtaking it, covering the distance of fourteen miles between the two towns in thirty-five minutes.

During the past week or so there has been a rumor abroad to the effect that the Hartford Rubber Works Company, Hartford, Conn., contemplated closing their branch houses in Buffalo and Cleveland, and in some instances the rumor had it that this was already an accomplished fact. The company makes haste to brand the report as entirely unfounded, and states that there is no intention of taking any such action, nor has the matter come up for consideration.

The C. A. Shaler Company, of Waupun, Wis., have just made shipment through C. B. Richard & Company, custom house brokers, 31-33 Broadway, New York City, of ten cases of their Shaler electric vulcanizers, which is the first of such shipments which are to be made monthly during 1908, to one of their largest foreign accounts, Armand Frey & Co., Behren Strasse 47, Berlin, Germany. This order for 120 cases is a direct result of the Madison Square Garden Show.

The Hess-Bright Manufacturing Company, of Philadelphia, has found it necessary to make a third change to larger quarters and will shortly occupy a four-story building, with a floor space of 15,000 square feet, exclusive of the basement, which is given up to a modern gas producer power plant. Aside from the DWF ball-bearing division, this is the largest plant devoted exclusively to the manufacture of ball-bearings of only one grade, that of the annular type. The new quarters will be occupied some time within the next six weeks.

When Nelson S. Riley, of New York, went to Honolulu last fall, he bought a new Studebaker "30" car from the Studebaker branch in San Francisco and took it with him to the islands. The machine attracted a good deal of attention in Hawaii, especially as it was the first car ever seen there employing the "make and break" system of ignition. Mr. Riley writes that the quiet running qualities of his car have been particularly commented upon and its noiselessness has earned for it the name of "the gliding car."

A preliminary injunction has been issued by the U. S. Circuit Court, Southern District of New York, against the Motor Car Equipment Company, of New York City, forbidding them to make or sell lamps in imitation of the Rushmore Flare Front searchlights and headlights; also to use the words "Flare Front" or the name Rushmore in describing their product. This injunction is in line with the one lately issued against the Manhattan Lamp Works. Actions will shortly be brought against a number of other concerns for injunctions and an accounting.

The Brush-Detroit Motor Company, 255 Jefferson avenue, Detroit, according to a letter just received by THE AUTOMOBILE, does not believe that the times are particularly hard. States Manager P. R. McKeeney: "We are doing phenomenally well in our new quarters, having sold twelve cars in less than four weeks, some of these for immediate delivery and the balance for early spring delivery. We are still getting replies from our last advertisement in your publication, and they all seem to be good prospects." This company sells the Brush \$500 runabout.

Further important additions are about to be made to the building and manufacturing equipment of the Rambler factory which has been for years one of the largest exclusive automobile plants in the world. Within the past two weeks six more acres of ground, adjacent to the factory in Kenosha, have been purchased by Thomas B. Jeffery & Company. The ground area now measures one-half mile from east to west and one-half mile from north to south. This factory has been in operation every single working day since 1900 and each year the capacity of the factory has been considerably increased.

"A car a day has been the record of the shipping room of the F. B. Stearns Company since early in December, and this pace bids fair to continue until the 1908 stock is exhausted," say the makers. "The market seems to be easing up steadily, and the prospects for a good selling season are better right now than they were at this time last year, which is saying a good deal. A visitor to the Stearns factory is more than impressed by the way work is being rushed, and the full night shift is still hard at it. Talk of the recent 'near-panic' has not affected this plant any more than scores of others turning out really high-grade machines."

The continental touring service which has been conducted by E. B. Gallaher, of 228 West Fifty-eighth street, New York City, has been transferred by arrangement to the Maja Company, Ltd., for which Mr. Gallaher is director and American manager. In addition to the branches maintained at Havre, Southampton, Liverpool, London, Stuttgart, Genoa, and Bremen, additional agencies will be opened in connection with the Maja branches at Hamburg, Paris, and St. Petersburg. The service inaugurated by Mr. Gallaher has been decidedly helpful in its work of furnishing information and service in the matters of shipping, repairs, licenses, regulations, road maps and many other details. Its effectiveness will be largely increased under the new arrangement and as the entire organization of the Maja Company, Ltd., will be available.

The selling force of the Meek Company, dealers in leather goods and advertising specialties, Coshocton, O., has been sent on an unusual continental automobile tour. The entire force was supposed to leave the factory on an imaginary tour to the Pacific Coast, following the general direction of the Northern Pacific Railroad, and returning by the route of the Southern Pacific. One hundred towns, which for convenience have been called 100 miles apart, have been placed on the route. Each man is supposed to have some well-known make of automobile, the progress of which is determined by amount of sales. A perfect day carries him 100 miles; a perfect week a further advance. The salesman to return to Coshocton first receives the most valuable prize. There are six lesser prizes.

NEW AGENCIES ESTABLISHED.

The American branch will open a Boston office and salesroom at 885 Boylston street, Boston, for the handling of Fiat cars. S. H. Baker will be in charge.

The Bartlett-Jacobs Company, No. 887 Boylston street, Boston, in addition to the Allen-Kingston agency, has added the Mercedes and De Dietrich cars for Boston and vicinity.

Joseph M. Gilbert, general manager of the Continental Caoutchouc Company, announces that two more distributing agencies have just been added to agency representation of his concern. They are the Long Island Auto Supply Company, 1249 Bedford avenue, Brooklyn, and the Acme Rubber Company, Toledo, O.

Renault branches on the Pacific Coast will in future be handled directly by the Renault Frères Selling Branch's own establishment at 316-322 Van Ness avenue, San Francisco. Paul Lacroix, general manager for the Renault in America, has just completed arrangements.

The Palmer & Singer Manufacturing Company, of New York City, have just added to their already very representative line of cars, the new Selden 28-horsepower car to sell at \$2,000, which will give them one of the most complete price ranges that almost any agency house in the country can boast. They will control the Selden throughout Greater New York. Rose & Thompson, proprietors of the Yonkers Auto Station, will handle the Selden in that city. Mr. Rose was formerly associated with E. T. Birdsall, the designer of the Selden, in the old Decauville Company.

PERSONAL TRADE MENTION.

J. S. Draper, for the past three years sales-manager of the Wayne Automobile Company, Detroit, Mich., has just resigned that position to assume the duties of general sales-manager of the Mora Motor Car Company, of Newark, N. Y. Mr. Draper's resignation became effective on February 1.

Roy D. Chapin, treasurer and general manager of the E. R. Thomas Detroit Company, is now making a trip to the Pacific Coast in the interests of the latter. A considerable business in Thomas Detroit cars is done in the Far West and particularly on the coast, and as Mr. Chapin is well and favorably known there he is expected to make a very successful trip.

FOR UNMATCHABLE QUALITY BUY COES STEEL HANDLE MODEL WRENCH

THE WRENCH for Automobilists

High-grade quality in every detail of design, material, workmanship and up-to-date improvement. Excellence with extremely reasonable cost.

- NON-BREAKABLE CASTINGS
NON-STRIPABLE THREADS
NON-TROUBLESOME PARTS

QUALITY Through and Through.

Look for the name—COES

70 years splendid reputation maintained right up to the present time as the World's Best Wrench Makers. Write for "Wrench Book" free.

COES WRENCH CO., WORCESTER MASS.

THE AUTOMOBILE

ACROSS THREE CONTINENTS BY AUTOMOBILE

TO the accompaniment of a mad, hooting, shouting, honking and cheering in various languages, seven automobiles and twenty men have left New York for Paris on the Western trail. The majority of those who gathered round Colgate Hoyt in Times Square to witness the start Wednesday morning said the scheme was a mad, impossible one; among the contestants each man declares that the other fellow will never do it. Questioned individually, each team considers it has just the combination of units essential for a journey of 20,000 miles across America, through Alaska, over the Behring Straits, Siberia, Russia, and Europe to Paris.

France, America, Germany and Italy, the former with four, the others with one unit each, are the active participants in the round-the-world trip which every country on the globe is watching with more or less interest. France has four cars; officially she has but three. A few months ago, soon after the Pekin-Paris run which the world declared a mad scheme, but which every contestant but one accomplished, a soldier-sailor stepped into the *Matin* office in Paris and proposed a round-the-world trip via New York and the Behring Straits. The man was M. Lelouvier, the hero of a thousand

adventures, whose life story reads more like a page from a boy's book of adventures than a narration of twentieth century facts; a man who had passed his life playing with death.

Lelouvier's suggestion was adopted, *Le Matin* obtained the collaboration of the *New York Times*, and the run was announced. But the originator of the idea had his own views

on how such an event should be conducted, preferred a route which he had traveled on foot and by sleigh, and refused to depart from it despite the advantages of an organization backed by two powerful journals. Tuesday he set out alone, unsupported by other than his own forces, but none the less resolved to work a way through to Paris. The official contestants then are: Thomas, 60-horsepower (America), Montague Roberts, M. Garchard; De Dion, 30-horsepower (France), Captain H. H. Hansen, M. Autran, G. Bourcier St. Chaffray; Motobloc, 28-30-horsepower

(France), M. Godard, M. Hue, M. Livier; Sizaire-Naudin, 15-horsepower (France), Paul Pons, M. Berthe, M. Deschamps; Züst, 28-30-horsepower (Italy), Antonio Scarfoglio, Emilio Sartori, Henri Haaga; Protos, 40-horsepower (Germany), Licut. Koeppen, Engineer Hans Knape, Engineer Ernst Mass, on special leave from the German army.

PARTICIPANTS ABOARD "LORRAINE."

ENTHUSIASTIC DEPARTURE OF DE DION CAR FOR HAVRE, PASSING THROUGH THE BOULEVARD DE LA MADELEINE, PARIS.

LELOUVIER AND THE WERNER, WORLD'S TOURING CANDIDATE.

The general manager and organizer of the trip, the man on whom all the responsibility of detail work has fallen, is G. Bourcier St. Chaffray, the *Matin* delegate, who will travel as passenger in the De Dion car as far as Alaska. Captain Hans Hendrick Hansen is a Norwegian with long experience in Siberia and the Arctic regions. The equipment of the car for the ice regions has been left entirely in his hands, and has been worked out in a marvelously clever manner. "It needs grit to go on a trip like this," said one observer at the starting line. "No, it doesn't," rejoined Hansen, "it needs thought; thousands of men have grit, but that won't carry you through the Arctic regions. You must have a well-thought-out and carefully prepared scheme. Questioned further, the Norwegian explorer said: "My plan is to jog along over the United States in an easy manner; I shall not race if every automobile in America urges me on. It is when we get to East Cape that the struggle will begin, and we shall need all our strength. For an entire month there will not be a moment's rest for man or machine, for I intend to run continuously. A searchlight will enable us to travel almost as easily by night as by day, and when we come to the long frozen stretches we shall hoist sail and run under auxiliary power. I have done this for hundreds of miles in Siberia and know what to expect." Captain Hansen is not an expert automobilist, but he has with him M. Autran, a Frenchman, the crack mechanic of the De Dion factory.

Roberts, the American driver, has been too much before the public during the last two years to need introduction. Unfortunately his engagements in the East prevent him going through to the end, and he will probably leave the party at San Francisco. M. Garchard will accompany him.

Godard, the driver of the Motobloc, is a devil-may-care

SIZAIRES-NAUDIN AND DE DION-BOUTON, WORLD'S TRAVELERS.

Frenchman who made the journey from Peking to Paris last year on a Spyker, a trip, he declares, quite good enough to prepare a man for a round-the-world jaunt. His two companions are both skilled mechanics. Paul Pons, a thin, wiry man who drove a tricar out from Peking, says lightweight will carry him through. In addition to a mechanic, he has with him a Pathé cinematograph operator. Zust is all-Italian, Scarfoglio, Sartori and Haaga all experienced motorists, trained to hardship, but with no special experience in Arctic regions. Germany has sent a full military team for the Protos car, the three army officers being splendid examples of physique, drilled to hard service and recently trained for automobile work.

It is exceedingly doubtful if the United States will be crossed from East to West. Owing to the late start and the fear of arriving in Alaska during the thaw, it will probably be necessary to ship the cars on the train at Ogden or Cbeyenne and run them direct to Seattle, where they will be carried by boat to Valdez, Alaska. Though this will break the run, the contestants believe that it is preferable to lose a few miles in America rather than run the risk of making the journey impossible by too late arrival in Siberia. The real test, indeed, will not commence until Nome

ST. CHAFFRAY, HANSEN, AND AUTRAN, OF DE DION PARTY.

has been reached. From New York the run is to Albany, Buffalo, Cleveland, Toledo and Chicago.

How the Cars Are Equipped for the Journey.

Though each contestant believes that his own special type of stock chassis is the most suitable for the round-the-world trip—and in not one single case has a special machine been built—ideas are varied as to the best type of equipment for a journey through Arctic regions never before invaded by an automobile. Of the seven contestants the De Dion certainly stands out as the one most carefully prepared and equipped for the task it has set out to accomplish. An ordinary 30-horsepower, four-cylinder chassis has been selected, and although having few external points of resemblance with the factory's ordinary product, it is as a matter of fact unchanged in any mechanical feature. The machine used, indeed, is one of those which took part in the Coupe de la Presse tour and race last August, one of the essential conditions of which was conformity with stock standards.

The frame has been filled with soft wood, wrapped in felt, and finally covered with rubber. Axles, springs, steering column, and in fact every exposed metal part subject to strains has been treated in this way, Captain Hansen declaring such protection essential to preserve the steel from the effects of extreme cold. The only change on the engine is the raising of the exhaust manifold with a view to keeping

the temperature under the bonnet a little higher than usual. A pan the full length of the chassis protects the underworks, but makes the road clearance rather small for a journey over virgin country. Seven independent gasoline tanks, with a total capacity of 154 gallons, are carried immediately above the frame from the driver's seat rearward. All are stoutly encased, separated by partitions, and connected up separately to the carbureter, so that should one become disabled, only a small amount of precious fuel would be lost. Above the layer of tanks is what at first appears to be a square delivery body; on climbing up on the running board it is seen that a circular well has been left of just sufficient size to allow of the accommodation of spare tires, the center being the seat for the third man.

In the chests built round the well are spare parts, tools, clothing, a Nansen kitchen, sufficient food for one month, and the thousand and one things necessary for an Arctic exploration.

To prevent the water freezing a special preparation has been supplied to all the contestants, the nature of which has not been made public. If all works out in practice as in the laboratory tests, everything will be well; if not each driver will have to rely upon his own ingenuity. The Standard Oil Company is supplying to all contestants a special brand of lubricating oil guaranteed not to freeze under the most rigorous climate. De Dion, however, being an oil refiner, uses his own. Steel studded Michelin tires and Vinet dismantlable rims are being used. On frozen snow or ice the rims will be dismantled and steel ones with sharp spikes will be substituted; where railroad tracks run through the country to be traversed, steel flange rims will be fitted, and the car run like a locomotive. Captain Hansen declares that for several hundreds of miles through the Arctic regions he will have a steady wind astern, and to take advantage of this will step a mast in front of the radiator and hoist a lug sail. Over soft snow long wooden runners will be attached to the front wheels, making the car practically an automobile sleigh.

Compass, sextant, charts and roll maps occupy convenient positions in front of the driver. A portable dynamo will be fixed up in such a position to be worked by one of the passengers during the journey, and being connected with storage batteries will lay up a supply of electricity for night traveling. It is believed that a hand operated dynamo, with suitable gearing, is preferable to one driven by the motor, for it will relieve the engine of a little work and serve to keep the operator warm. For the same reason the small but powerful windlass is worked by hand. Protection for the drivers is afforded by a stout leather

ZUST JUST BEFORE EMBARKING AT HAVRE ON THE "LORRAINE."

apron, a slight canvas wind shield with celluloid front, and a light folding hood covering the entire body. Enveloped in their Arctic sleeping bags, the men will take their rest in the snow—one of the most comfortable beds imaginable, declares the Norwegian explorer.

How the Only American Competitor Is Fitted Out.

Montague Roberts, America's only representative in the 20,000-mile trip, will have a standard 60-horsepower Thomas Flyer built at the Buffalo factory and fitted out under his supervision. Externally there are fewer departures from standard equipment than on any of the machines taking part in the tour, the car being the usual Thomas runabout with such necessary equipment as conditions suggest. Ordinary 36-inch wheels and tires will be used on the early part of the journey; later these will be changed for 40-inch wheels with solid tires, so designed that should the rubber wear out the machine can run on the steel rims. Spare tires are carried behind the rumble seat. Running the full length of the car, and each side of the vehicle, is a long wooden

MOTOBLOC CREW ADDING FINAL EQUIPMENT BEFORE DEPARTURE.

support to which the various parts of the equipment are attached and which will serve to work over rough road. Ninety gallons of gasoline are carried in the ordinary tank, and sixty gallons in the reserve tank. A winch is fitted to the front of the car and connected to the engine by coupling gear. Provision has been made for warming the driver by means of the exhaust gases, and protection will be afforded the men by a wind shield and a buggy hood.

Godard, who has aptly been termed the dare-devil of the party, declares that he put all the official instructions on how to prepare for the run into a bag as soon as they were received and has not opened the bag yet. The enthusiastic, irrepressible Frenchman made the run from Pekin to Paris and believes that he there learned enough to know how to fit his Motobloc for the New York-Paris expedition. A standard 24-30-horsepower chassis has been taken, fitted with a four-seated runabout body, and furnished with a large chest in the rear of such dimensions and arranged in such a way that everything required for the trip can be found when wanted. The standard gasoline tank at the rear of the chassis is retained, but it is admitted that it is doomed to be sacrificed, probably before America has been left, and reserve tanks have been fitted with a capacity of over seventy gallons. Tires used are a patent cushion type with multiple interconnecting air chambers. Spacious boxes on the running boards contain tools and such articles as are likely to be needed frequently on the run. The drivers are protected by a folding hood and a leather wind shield.

A One-lunger Will Invade the Arctic Regions.

A 20,000-mile run with no other power than that furnished by a tiny single-cylinder engine of four and a half inch bore appears the height of temerity; Paul Pons, the driver of the French Sizaire-Naudin declares that there is nothing extraordinary in it. When asked if his power is not too small, he smiles and replies in the vernacular—for though a globe trotter he has not learned to converse in any other than his own language—"Not a bit of it; if I have little power I have little weight; some of the other fellows have three or four tons to move over the country. In comparison I have nothing. I have a spare seat on the car, and if you know of any American who would like to make the trip, I shall be glad to take him along." Pons, who is a lightweight himself, has had experience with lightweight machines, being the driver who set out from Pekin on a tricycle last year with the intention of reaching Paris. His gasoline supply became exhausted, and his tricar is still rotting on the Gobi desert. A standard 15-horsepower machine has been selected, fitted with larger wheels, the frame filled with soft wood, and supplied with extra gasoline tanks capable of holding 33 gallons. As with all the French contestants using pneumatics, Michelin tires are employed. For cooling his engine Pons will try the non-freezing mixture supplied to all the contestants, but if this does not give absolute satisfaction will adopt pure kerosene, which he declares to be excellent.

Italy has a powerful-looking representative in the Zust, said to house but 28-30-horsepower under its green, white and blue bonnet. A standard chain-driven model has been selected for the trip, unchanged in any mechanical feature. The frame has been filled with soft wood, the springs are wrapped with cord, but no other protection has been given to the chassis. Built up from the dash is a metal and canvas shield completely protecting the driver; as the sides are built round in the same way, the two men in the front seat operate in an almost entirely inclosed vehicle. Behind the two rear seats a series of metal chests have been built up, the lower ones containing gasoline tanks with a capacity of 100 gallons, the upper ones holding tools, equipment and food. There is room for three passengers on the seat behind the driver, but only one man will occupy it, the remain-

ing space being occupied by tires and stores. Pirelli pneumatic tires, an Italian production, have been selected.

Though an outsider, M. Lelouvier and his Werner car have to be reckoned with on the tour, any man willing to start on an expedition of this nature alone and unaided possessing more than ordinary qualities of assurance and determination. The machine selected is a composite, consisting of a 15-horsepower De Dion engine and a Lacoste & Battmann chassis. There being no fixed gasoline stations where Lelouvier can replenish his supply, he is under the necessity of carrying an extra large quantity along with him, and in addition must find room for all spare tires and parts that he may need before reaching Paris. To meet these difficulties he has prepared as many stations for himself as possible, his wife, at present in Siberia, personally looking after this part of the trip. Lelouvier has so often emerged safe and sound from positions in which he ought, according to all natural laws, to have met disaster, that he is looked upon as having a charmed life, and may be expected to pull through the New York-Paris run, despite the difficulties under which he works.

Sixteen days is the record time in which the Berlin factory built the four-cylinder 40-horsepower Protos car. Weighing 6,000 pounds, 196 inches in length, and 80 inches wide, it is one of the largest and most powerful looking vehicles on the run. The extra width has been given to allow the men to sleep on the floor of the car, and when the canvas hood is up it has much the appearance of an army wagon. The gasoline supply of 176 gallons is contained in six separate tanks. The car is shaft driven, has runners for the front wheels, steel spike rims for the rear, and uses Diamond tires where pneumatics are practicable.

Race to Carry American Flag to French Club.

During the farewell banquet offered by the Automobile Club of America to the contestants, an American flag was presented by President Hoyt to each of the teams. Immediately after the presentation Jefferson DeMont Thompson, chairman of the A. A. A. racing board, stated that he would give \$1,000 in gold to the first man presenting one of these flags to Baron Zuylen, president of the Automobile Club of France, on arrival in Paris. On the sportsmanlike offer being communicated to the teams through an interpreter, a cheer arose, and one of the Frenchmen exclaimed: "We shall present that flag." The triumphant flag will be returned to the A. C. A. to be preserved as a trophy.

CHICAGO CLUBS TO FIGHT NEW WHEEL TAX.

CHICAGO, Feb. 10.—Automobile associations in this city were fully prepared for the passage of the wheel tax ordinance which was passed by the City Council last week at the same time that the wide tire ordinance was put through, both being scheduled to go into effect on May 1 next, and the campaign against the former was immediately undertaken to prevent its being enforced, the legislative committee of the Chicago Motor Club, of which John McKeown is chairman, acting under instructions from Secretary G. G. Greenburg, taking steps to procure an injunction to prevent the municipal authorities from carrying out the provisions of the ordinance. The latter provides for a tax of \$5 on a one-horse vehicle, and a tax of \$12 on a two-passenger automobile, while the charge for a two-horse vehicle is but \$10 and that of an automobile seating more than two persons is \$20 annually. The charge for auto trucks and commercial cars is \$30. All the automobile organizations are united in their fight against the new ordinance, and in this they are backed up by the teaming interests. It is the consensus of legal opinion that the measure is clearly unconstitutional, this being founded in part upon the case of the City of Chicago vs. Collins in 175 Ills., which ended a similar attempt to tax bicycles, and it will be fought on this ground.

A. M. C. M. A. IN SESSION RE-ELECTS BRISCOE AND REEVES

DETROIT, Feb. 10.—Optimism was spelled with large letters at the annual meeting of the American Motor Car Manufacturers' Association, held at the Hotel Pontchartrain Saturday. Thirty-four of the fifty-two concerns enrolled were represented. And from each there came the same story, not for publication, necessarily; not for the purpose of overawing the layman, for there was little shop talk outside of the meeting.

But when the makers of motor cars settled down to discussion of the situation and compared notes on the outlook there was one verdict, and that was that in spite of the lull caused by the recent financial flurry the coming season will prove a good one. This conclusion is not speculative, but the result of a careful canvass of the field.

"Business never looked so good for the automobile manufacturer," said Chairman Briscoe. "This is particularly true of makers of medium-priced cars, whose popularity is constantly increasing. There is a practically unlimited field for machines of this type, and it is this trade that is a positive boon to the industry. The man who buys a high-priced car usually belongs to the class first to be affected by a tightening of the stock market. On the other hand, it has been the experience of the trade that purchasers of the more moderate priced machines belong to the conservative element, investing in a car not only for pleasure, but from the standpoint of utility. It is in this respect that the American Motor Car Manufacturers' Association, embracing as it does a majority of the makers of moderate priced cars, occupies an advantageous position. The last quarter of 1907 was quiet, owing to unsettled conditions in the money market, but everything indicates that the demand for automobiles this season will be fully up to the supply, with manufacturers enjoying one of the most prosperous seasons in the history of the industry."

General Manager Alfred Reeves, of the independents, is no less sanguine regarding the outlook, his optimism being based on statistics gathered from authentic sources, and which cover the situation thoroughly.

"Possibly the most noteworthy feature is the increasing demand for moderate-priced cars on the part of physicians, contractors, salesman and others," said Mr. Reeves. "This field is in its infancy, as yet, and the opportunities developing are marvelous. Another line that is attracting attention is the taxicab. Wherever tried, these taxicabs have proved a success, and the favor, with which they have been received has stimulated interest in their manufacture."

Reports from officers and the several committees were all of an encouraging nature. The treasurer's report showed last year to have been the most profitable in the history of the association. Equally gratifying was the statement of the show committee, last year's exhibit at the Grand Central Palace exceeding all previous efforts from a financial as well as artistic point of view, and permitting a 25 per cent. dividend to all exhibitors. Fifteen new members were added to the association during the year, making it the strongest numerically of any organization of its kind.

The sum of \$5,000, to be used according to their discretion during the coming year, was voted to the good roads committee, consisting of Charles E. Lewis, chairman; James Couzens, H. B. Krenning and R. E. Olds.

The association also voted, at the invitation of the American Automobile Association, to cooperate with that body in tours and races, the committee having the matter in charge consisting of H. O. Smith, chairman; Walter C. Marmon and A. C. Newby.

Officers of the association for the ensuing year, with the exception of Messrs. William Lewis, Everitt and Stoddard, all holdovers, are as follows:

Chairman of committee of management, Benjamin Briscoe, Maxwell-Briscoe Motor Co.; vice-chairman, R. E. Olds, Reo Motor Car Co.; treasurer, H. O. Smith, Premier Motor Manufacturing Co.; secretary, William Mitchell Lewis, Mitchell Motor Car Co.; auditor, W. H. VanDervoort, Moline Automobile Co.; additional directors, B. F. Everitt, Wayne Automobile Co.; Charles E. Lewis, Jackson Auto Co.; C. G. Stoddard, Dayton Motor Car Co.

GOVERNOR AND MAYOR OPEN THE DETROIT SHOW

DETROIT, Feb. 10.—Governor Fred M. Warner and staff and Mayor William B. Thompson lent dignity to the opening of the annual Tri-State Automobile and Sportsmen's show in Light Guard Armory to-night, both officials voicing a welcome to the State and city, and being given an enthusiastic reception by a crowd which occupied every available foot of space in the great auditorium.

This year's exhibition is in a sense a three-ring show, automobiles occupying the main floor, accessories being shown in the gallery, and motorcycles in the drill hall. Manager E. E. McMasters has labored long and arduously to make the event

a success, and has made good in every sense. There are some twenty exhibitors of motor cars, more than twice that numbers of models being shown, while several of the score of dealers have several makes on display. Accessories and motorcycles likewise have a larger representation than ever before. Special events have been planned for each evening during the week, Monday being Governor's night; Tuesday, Automobile Club night; Wednesday, Society night; Thursday, Good Roads night; Friday, Board of Commerce night; Saturday, Question Club night. The complete list of exhibitors is as follows:

Main Floor.

Northern Motor Car Co.	Anderson Carriage Co.
Cadillac Motor Car Co.	Standard Auto Co. (Packard car).
Aerocar Motor Co.	Fee-Bock Auto Co. (Elmore and Waverly).
Welch Motor Car Co.	Motor Car Co.
Crescent Motor Car Co.	Wayne Auto Co.
Fee Electric Car Co.	Rellance Motor Car Co. (commercial cars).
Regal Auto Co.	Jackson Automobile Co., Jackson.
Oakland Motor Car Co., Pontiac.	
Rapid Motor Car Co., Pontiac.	
Brush Runabout Co.	
Bloomstorm Mfg. Co.	

Gallery.

Ajax Grieb Rubber Co.	Chas. E. Miller, New York.
C. M. Preston.	Gemmer Manufacturing Co., Detroit.
Michigan Storage Battery Co.	Pittsburg Lamp & Brass Co.
Diamond Rubber Co.	Michelln Tire Co.
Diamond Speedometer Co.	

Wildenpin Tire Co.
Morgan & Wright.
Continental Caoutchouc.
Jones Speedometer, New York.
C. F. Splittorf, New York.
Goodyear Tire & Rubber Co.
G & J Tire Co.
Hartford Rubber Works Co.
Heinze Coll Co., Lowell, Mass.
Norris Auto Co., Saginaw.
Hilbard Engineering Co., Detroit.
Flak Rubber Co.

B. F. Goodrich Co.
N. Y. & N. J. Lubricant Co., New York.
Perfection Non-Skid Climber Co.
Witherbee Igniter Co.
J. L. Glibney & Bro., Philadelphia, Pa.
Auto Igniter Co., New York.
Visor Knitting Co., Niagara Falls.
Elastic Tire Filler Co., Boston.
John H. Thompson & Co., Detroit.

Drill Hall.

Economy Cycle Co.
Palm Engineering Co., Detroit.
Seltz & Co., 225 Beecher avenue.
F. Kicherer, 206 St. Aubin avenue.

Excelsior Supply Co., Chicago.
Good Roads Exhibit.

"FROM ATLANTA TO THE SEA."

By PATHFINDER

THE TYPE OF TOWN THE AUTOIST SEES IN GEORGIA.

HAND POWER COTTON PRESS THAT SEES SERVICE.

AN ACCIDENTAL MEETING WITH THE CHAIN GANG.

MANEUVERING THE WHITE STEAMER ON SAVANNAH WHARF.

GEORGIA has made so little progress in improving highways that, by no stretch of the imagination can that State be now considered as an attractive section for the automobilist. This is the verdict I have to render to my fellow tourists after my trip from Atlanta to Savannah, the fourth and last section of the tour of exploration I have been making in my White Steamer. In my article in last week's issue of *THE AUTOMOBILE*, I entered the complaint that the highways in certain sections of the South are adapted only for horse-drawn vehicles, but in some parts of the State of Georgia, the highways are not even adapted for horses and wagons, their condition being unsuited to any type of travel.

I do not wish to convey the impression that there are no good roads in Georgia. On the contrary, some of the counties have a fine stretch of almost perfect roads which have been built and are kept in repair by convict labor. The good-roads counties, however, are those in which the larger cities are located. In the majority of counties apparently no work whatever is done on the roads, for they are nothing more than sand trails. Sand does not make a good road, yet, on the other hand, it does not offer any particular difficulty to the tourist with a high-powered car. The principal reason why touring in Georgia is unattractive is that very few of the numerous streams are provided with bridges. Furthermore, as one approaches the coast, the country becomes more and more swampy, and it is hardly an exaggeration to say that one must do almost as much traveling in water as on the dry sand.

We reached Savannah under our own power, which is equivalent to saying that the water which we went through was in no place more than three feet deep, but it is certainly true that some of the streams which we forded were of this depth and the reason we could ford them was that we had enough steam in our generator to take us across, even when the water extinguished our burner. Also, although the water came up around the engine, the walls of the White engine are so well protected by asbestos that we did not run the risk of cracking a cylinder, as might easily have happened to cars whose cylinders would be directly exposed to the bath of cold water. It is evident, therefore, that this part of our tour was not of such a nature that many would care to follow us, particularly in the rainy months of January and February.

On leaving Atlanta, we had ten miles of fine road, which stopped abruptly at the county line, and from that point on we had a country road, which, although sandy, still had an admixture of clay which made a fairly good surface. We had no difficulty in finding our way, for all that day we paralleled the tracks of the Georgia Central Railroad. After we had traveled about thirty miles from Atlanta, the road consisted simply of a narrow trail between the railroad tracks on the one side and the cotton fields on the other. For much

THE BIGGEST OAK IN GEORGIA.

of the distance there is a road, such as I have just described, on either side of the railroad, and we crossed frequently from one side of the tracks to the other, according to which road seemed the better.

When the sand road terminated abruptly and a fine road began we knew that we were in the county where Macon is located. This part of our journey, from Atlanta to Macon, a distance of 103 miles, was the easiest kind of a day's ride, and I believe would be at any season of the year. There is not much water on this part of the route, and the sand is not particularly heavy.

As soon as we reached Macon, we perceived that the rest of our journey to Savannah would not be so easy. There are two garages at Macon, and at neither of them could we find any one who had ever made the trip to Savannah or who knew of any one who had made it. I called on the chief of construction of the Bell Telephone Company. "Don't follow the route our wires go," he said. "You will never get there if you do." Then I visited the offices of the Western Union Telegraph and the Postal Telegraph Companies, and each construction chief advised me not to follow *his* route. Our party held a council of war. "I cannot get any accurate road information," I said. "It looks as if we would have a hard time whichever way we go. Therefore, I move we follow the route which, as far as can be judged by observing on the map the courses of the different rivers, passes through the highest part of the State. It happens that such a route would be almost the shortest between the two cities." Motion unanimously carried, and without any more definite information than this, we started from Macon to Savannah.

We headed due east, having good roads as far as the county line, and thereafter very poor roads. We had spent the entire morning in search of road information in Macon, and, with the numerous stops to make inquiries along the road, we had not proceeded further than Jeffersonville when darkness came on, and here we spent the night. The hotel proprietor told us that we should proceed to Dublin, a little south of due east, and we would here find a bridge across the Oconee river. We made Dublin easily the next morning and here learned that a highway, known as the "Savannah road" starts at that place. Thereafter our task of finding the road was comparatively easy. All we needed to do was to ask for the "Savannah road" and we could obtain definite directions. Our only difficulty was that we several times took the wrong fork and traveled several miles before we would meet any one from whom we could make inquiries.

The country from Dublin to Savannah is of the same general character. All of it is swampy, and as one nears the

coast it becomes "more swampy." While cotton plantations are visible from time to time, the greater part of this section is given over to the turpentine industry, which means that most of the trees are dead or dying, and the country correspondingly desolate. As one approaches the coast the sand becomes heavier, and, since all the wagons drive in one track, the ruts are so deep that if your wheels once slip into them, there is no getting out until you reach a little stream or a pond of water in

CITY HALL AT SAVANNAH.

THE DESOLATE CHARACTER OF GEORGIA'S MAIN ROAD.

ONLY DEEPEST PARTS OF THE RIVERS ARE BRIDGED.

ALMOST AS MUCH WATER TRAVEL AS LAND TRAVEL.

BUILDING A TRESTLE OVER A PATCH OF QUICKSAND;

the roadway. We made a fairly comfortable run of about seventy-five miles that day and spent the night at Swainsboro at a hotel which, to put it politely, is probably suitable for the needs of its purely local trade.

From Swainsboro it was a case of heavier sand and deeper and more frequent fording places to Blythe. Here we saw before us, in the gathering shadows of the evening, the dreaded Ogeechee swamp, concerning which we had been hearing ever since leaving Dublin the most positive predictions that we could not cross it. We had again covered seventy-five miles for the day and were satisfied to wait until morning before attempting the passage. A day's travel of only seventy-five miles seems rather small unless one keeps in mind that, before going through the various fords, it is best to take time to sound them. My two companions had provided themselves with high rubber boots, and when we came to a stream or to a place where the water from a swamp encroached on the road, one of them would walk ahead and test its depth and find out if there were any soft places to be avoided.

After our night's stay at Blythe, we turned our attention to the Ogeechee swamp, which is formed by the Ogeechee river overflowing its banks. As my companions learned by wading ahead, there is a bridge over the deepest part of the stream, but in order to get to the bridge, and then from the bridge back to terra firma, they declared that we would have to go through not less than three feet of water.

Had we been starting on the tour from Savannah and then encountered the swamp, I would certainly have turned back, but having come so far and being almost within sight of our destination there was nothing to do but plunge into the water. And we came out safely on the other side, for reasons I indicated in one of the opening paragraphs. So momentous was the occasion of our passage of the swamp that we did not think about photographs until we had left it behind us, although we were "snapped" at some of the shallower fording places.

After passing the swamp we had about twelve miles more of sandy road, and then we struck an eleven-mile stretch of boulevard which led us into Savannah. With its broad avenues, handsome public buildings, splendid homes and, last but not least, the commodious Hotel De Soto, Savannah certainly looked good to us after almost three days spent in the turpentine country. We were promptly taken in charge by the enthusiastic local committee, which has the stock-car race in charge, and we were piloted over the sixteen-mile course, which is certainly well adapted for speeding. What impressed us the most, however, as regards the preparations

for the race, was the hearty co-operation which the State, city and county officials are lending to make the race a success. I could not help but express the hope that the problem of improving the roads in the interior counties of the State might, in the very near future, be attacked with the same enthusiasm and official assistance.

And now a few words in summary of our trip, an outline of which has been placed before the readers of THE AUTOMOBILE in four successive issues. Between New York and Savannah we covered a total of 2,044 miles; deducting side runs made to places of interest, etc., the distance between the two cities by the route which we followed is 1,830 miles. Our total elapsed time from New York to Savannah was three weeks and five days. Not all of this time was spent on the road, as we laid off one day in seven, and, moreover, took abundant time to see all places of interest on or near our route. As is evidenced by our uninterrupted progress, we had no trouble with the car. The total replacements comprised one front spring, in which a leaf was broken on the wretched roads leading to the Mammoth Cave. Before we could secure another spring we had traveled almost 400 miles, and I believe that, had we so desired, we could have finished the trip without even this one replacement. Aside from this matter of the spring, the only attention we gave to the car was to lubricate very thoroughly, to take up occasionally on our brakes and to tighten the stuffing boxes at intervals. The matter of tire repairs has been almost a negligible factor with us, partly owing to the fact that the White has tires of unusually large size and is, moreover, easy on tires, and partly because the Diamond tires on our machine showed themselves to be of good construction. One rear tire we did not touch; on the other we changed a casing. In one front tire we had a nail puncture, and on the other we renewed two inner tubes. I should also add that our Jones speedometer registered every turn of the wheel.

To review briefly the road conditions: From New York to Hagerstown is mostly over macadam; between Hagerstown and Cumberland the road is rough and neglected; from Cumberland to Springfield, Ohio, over the National highway, the objectionable features are the water-brakes; from Springfield to Cincinnati the roads are good; in Kentucky there are many miles of fine macadam, many miles of narrow twisting, well-surfaced roads, and some very bad stretches; in crossing Tennessee we found toll-roads most of the way; in Alabama there are many miles of pikes and many miles of mud; Georgia, the tenth and last State through which we passed, has only isolated communities where the good-roads idea has penetrated.

HEARING ON THE A. A. A. FEDERAL BILL.

WASHINGTON, D. C., Feb. 10.—A hearing on the Cocks bill providing for Federal registration of automobiles will be granted automobilists by the subcommittee of the House Judiciary Committee having the bill in charge, probably February 27. A conference regarding the proposed legislation was held last week by Charles T. Terry, chairman of the Legislative Board of the A. A. A., and the real author of the Cocks measure; Secretary F. H. Elliott, of the same organization; Representative Cocks, who introduced the bill; President Yellott, of the Maryland Automobile Club; and President Caverly and Secretary Mark, of the Automobile Club of Washington. These men went over the situation very carefully, and among other things it was decided to induce as many club presidents as possible to be present at the hearing.

The sub-committee which has the Cocks bill in charge is composed of Representative Tirrell, chairman, and Representatives Caulfield and Brantly. Chairman Tirrell is an automobilist, and is believed to favor the proposed law.

APPELLATE DIVISION SUSTAINS A. L. A. M.

In the action entitled Rowland vs. Clifton, familiarly known as the Searchmont suit, in which the trustees in bankruptcy of the defunct Searchmont Company attempted to enforce a division of the profits and assets of the Licensed Association on the ground that it was a partnership, the decision of Justice O'Gorman, dismissing the suit, which was rendered last spring, has just been unanimously affirmed by the Appellate Division of the Supreme Court. It was contended by the defense that the license of the Searchmont Company was forfeited when the latter went into bankruptcy, in accordance with the mutual agreement of the members when the association was formed, and Justice O'Gorman found that the provisions of the license in regard to its cancellation had been fully carried out, so that there was no ground for action. It was in 1904 that the Searchmont Automobile Company went into bankruptcy. In the earliest automobile contests, the Searchmont car made a very favorable showing, and a substantial future was predicted for the company.

ANOTHER MATERIALIZATION OF THE IDEAL AUTO

By A. E. OSBORN.

HAVING been much interested in C. H. Godley's specifications of his "perfect" touring car, I thought that others might also be interested in such descriptions and would like to see something further in this line, so have prepared the accompanying description and drawing showing my idea of how such a vehicle should be made. It should be understood that the vehicle I am about to describe is only my preferred design for an automobile corresponding to Mr. Godley's and intended for the same character of service and not my idea of what is going to be the most popular and important form as this undoubtedly will be a vehicle selling below \$350. It is, in fact, a high class five-passenger car capable of meeting all ordinary requirements, although not, according to present standards, a high-priced one, as owing to its general design and to the simplification of many of its details (only a few of which can be mentioned within the limits of this article), it could be made in a first class manner and, I believe, profitably sold at from \$800 to \$1,200. This vehicle would preferably be fitted with an engine of from 12 to 20 horsepower, as a larger engine is only a useless extravagance ninety-nine per cent. of the time, and even in the remaining one per cent. of little service, as it only permits a higher speed (than is safe sometimes), and this is a matter that will be considered of little importance compared with maintenance, cost, fuel consumption, etc., in the future. Moreover, for reasons hereinafter explained, the power that the engine develops is, in this vehicle, transmitted in a more efficient way and applied in a more effective manner than has hitherto been the case, so that an engine of the power specified would give results more than equaling the results that could be obtained in other vehicles with from ten to twenty per cent. more power. I prefer that the engine have two offset cylinders, although it is realized that many prefer to sacrifice the simplicity, low cost and economy of the two-cylinder engine in order to gain a more even motion and I would provide for this preference by having my vehicle arranged so that a four-cylinder engine could be readily fitted and supplied at an extra price. The engine would be set with its shaft across the vehicle and would be air-cooled, as it is unmechanical and absurd to carry the water plumbing at present in fashion when better results can be gotten by the simpler, lighter and more direct air-cooling, if the air-cooling system is correctly designed. As I have some ideas in regard to two-cycle, air-cooled engines which I believe will make it superior to any other form, I naturally prefer its use on this vehicle and believe an engine of this type will supersede the ordinary four-cycle engine. However, even if a four-cycle engine was specified, it would not be of the present popular forms, but would have two 4 1-2-inch by 4 1-2-inch cylinders set at 45 degrees, a single-throw crankshaft, splash lubrication, detachable cylinder heads with valves in them, automatic intake valves, and special exhaust valve arrangements. The ignition should be by dry batteries, a single non-vibrator coil, with distributor and a special quick-acting contact timer, although provision should be made for fitting a magneto as an extra. The mixture

should be supplied by a carbureter, which should be automatic, without moving parts, be protected by screened inlets for gasoline and air, be arranged so that it can have its interior parts readily examined and be quickly detached from the vehicle, if necessary. It should have, as suggested by Mr. Godley, a special form of throttle valve whereby pure air can be admitted to the engine when desired, and I would prefer that this valve open the air port after it has cut off the mixture. The adjustments should comprise one thumb screw to regulate the mixture and one thumb screw to regulate the height of the fuel in the float chamber unless, as might sometimes be preferable, a pump feed to the carbureter were used when this latter adjustment could be eliminated. The muffler should be very simple, consisting mainly of a long piece of tubing with a special outlet. This completes the description of the important parts of the power plant of my perfect touring car, but it should be understood that in this description I have limited myself

LINES AND PLACING OF THE POWER-PLANT OF THE PROPOSED IDEAL AUTO.

to constructions which will not necessitate any experimental work, and that, for this reason, no mention of the possible use of direct pump feed, hot surface or high-compression ignition and increased charge expansion (as suggested by another contributor to THE AUTOMOBILE, Mr. Loughheed) has been made, as these features have not as yet come into successful use on motor vehicles, though they may be used in the future ideal car.

We now come to a consideration of the most novel part of this vehicle, which is the method of transmitting the power from the engine to the wheels. The first of these transmitting elements is the charge-speed gear. This is a two-speed and reverse planetary with large cone clutch and of a patented form having not more than three gears and requiring only one brake band for its operation, thus doing away with one brake band and one band adjustment and set of band-tightening parts. It should not have any separate reverse gearing or idle revolving drums or gears, as these parts are the principal source of noise and loss of power in the ordinary planetary system. In fact, it is perfectly possible to obtain double the efficiency of the usual planetary gear and incidentally reduce its already low cost about one-half, and it is certain that when this fact is appreciated the planetary gear will supersede the present fashionable sliding gear. This gear should be connected to the differential by either a direct chain or by spur gears, so that the power loss, number of parts and weight would be reduced to an extent hitherto impossible when the power

is transmitted all along the vehicle and around corners. The reason why this very direct driving system is possible lies principally in the fact that, as has no doubt already been surmised from the drawing, my perfect car would be front driven and the entire driving mechanism would be in front of the dash. The connection between the differential and wheels is by a special system, for which a patent has been applied for and in which the universal joints necessary to allow for steering are subject to a very small amount of pressure. It is also designed so as to permit of wheel bearings of the usual size (they can be plain if desired) and to permit of pivoting the wheels in the center line of their tread, thus reducing the strains on the steering gear and its tendency to develop play, and making steering easier.

My ideal in brakes would be to have only one actuating pedal and arrange it to simultaneously operate shoes acting on all four wheels, so that the braking strains would be one-half that now acting on each rear wheel. Thus, not only could the car be stopped in a shorter distance and the expensive wear which arises through slipping the rear tires on the ground very greatly reduced, but skidding due to the application of the brakes to the rear wheels only is prevented. While on the subject of skidding I would say that this is, without question, to a great extent preventable by front driving, as the tendency which is always present in rear driven vehicles for the rear wheels to get in front is entirely absent. Moreover, as has been found in the case of a small "home made" front driven runabout that I have built, this type of vehicle will hold to its course better when crossing car tracks, etc., than if rear driven, and will not, in case of loss of traction from slippery roads, show any side slipping tendency. Another advantage of front driving is in the fact that the rear springs can be very flexible and are not interfered with by the power transmitting elements, and consequently solid rubber or even (for commercial work) steel tires can be used on the rear wheels. In fact, a vehicle of this type would permit the successful use of solid tires on all wheels, provided a slight sacrifice of speed was made. Still another advantage, and a most important one, lies in the fact that the complete power plant and steering gear with front wheels can be arranged so that it can be quickly

detached from the rest of the vehicle as a unit and thus not only would economy be gained in manufacturing, but one power plant could be used for different kinds of vehicles (such as the touring car, shown in the drawing, a light delivery wagon or a taxicab)—the changing of the front part to a new kind of rear equipment taking much less time than is required in hitching a horse. Moreover, the detachability of the power plant would permit of its ready examination and of carrying one reserve plant only for use in emergencies instead of a complete reserve vehicle, where a number of vehicles have to be kept in service.

The control of the vehicle is preferably by a rotary grip on the steering wheel or lever regulating both spark and throttle in a special manner and by a pedal giving the high speed, an interconnected pedal giving the low speed and reverse, and a pedal controlling the brakes and also, unless the high or low speeds are held in action by their pedals, operating to automatically release the engine.

It should be understood that in the accompanying drawing no attempt has been made to illustrate the exact body design or the arrangement of trimmings or attachments that would be used. The hood shown is very short, in order to give plenty of body room and bring the passengers between the wheels, thus making easier riding.

It is fully realized that the vehicle just described contains many novel features and that it is, no doubt, very presumptuous to believe that at least some of them will be in the future car in view of the fact that several prominent automobile engineers and manufacturers have given it as their opinion "that finality of design has been reached;" "that the automobile of ten years hence will be substantially as it is to-day;" "that only detail changes are possible," etc., etc.

In closing I would say that I would like to have any of your readers criticise the above specifications, as I think such discussion brings about a better understanding of the merits of any new designs that may be suggested and hastens the time when those who can assist in the development of the perfect car realize that perfection has not yet been attained and that there is some prospect of something differing from the present standards eventually coming into extensive use.

HOW INDIANA'S AUTOS ARE DIVIDED.

INDIANAPOLIS, IND., Feb. 11.—The 5,000 mark in automobile registration was reached in Indiana the middle of last month. While there are in reality 5,143 motor registrations, 143 of these were for motorcycles, of which 43 are owned in the city of Indianapolis.

A comparative list which has just been prepared from the registrations in the Secretary of State's office discloses the fact that the seven makes having the most automobiles in use in Indiana are all manufactured outside of the State. This appears to be due to the fact that the average Indiana owner wants a low-power and medium-priced runabout, of which few are made in Indiana. Among the high-priced touring cars and runabouts Indiana manufacturers rank well. Registration figures show that there are 866 automobiles and 43 motorcycles in use in Indianapolis, Indiana manufacturers having the largest number. The twenty manufacturers leading in the number of automobiles in use in the State, as taken from the registers, are as follows:

Cadillac	515	Winton	110
Ford	494	White	100
Olds	415	Haynes	81
Rambler	249	National	79
Maxwell	214	Mitchell	77
Bulck	192	Franklin	77
Reo	168	Pope Toledo	74
Premier	159	Studebaker	72
Pope Waverly	134	Autocar	71
Auburn	117	Stoddard Dayton	62

GLIDE MAKERS SEEKING EXPORT TRADE.

J. B. Bartholomew, president of the Bartholomew Company, Peoria, Ill., makers of the Glide cars, left on January 20 last for an extended tour through Mexico, during the course of which he will visit all the leading cities of the Spanish republic and will place several agencies. Attractively illustrated leaflets and catalogues with full specifications in Spanish have been prepared and a thorough canvass will be made in this branch of the foreign trade. This trip is in line with the well-known policy of the Bartholomew Company where export business is concerned, Mr. Bartholomew having made an extended trip through Brazil and Argentina in the early part of 1906. On the present trip he will remain in Mexico until about the first part of March.

WHERE AUTOS ARE SCARCE.

Sonora, Cal., has "hopes" of some day becoming an automobile center. A query as to the prospects brought the following original response from the editor of the town's leading daily: "Most of the transportation here is per 14-mule team, driven by jerk line, or by Jerusalem jackass. Our subscribers who use automobiles are so limited in number that a census of the same would not leave more than a trace on the government blank. We are sorry, and hope some day matters will be different, and that, when our gold deposits are opened up more extensively, every one will have his own smoke wagon."—*Ex.*

PLEASURES OF ROAD TESTING TOLD BY TESTER

By ARTHUR H. DENISON.

THE average autoist, in his delight at the new car, thinks little of what its mechanism underwent during its trying-out proceedings. In the glory of new upholstery, the brass work shining like gold, and the varnish glistening without mark or scratch, it presents an appearance totally different to that when its motor first opened its valves and the music of its exhaust was a song of its power and speed. There was a little paint on the frame, plenty of oil on the rest of the machinery. The tires had seen service on perhaps a dozen cars, and as for brass and mudguards, we cared little unless the exigencies of business demanded work night and day. Then we hunted searchlights with clean reflectors; mudguards were only a nuisance. If it was muddy, we didn't care. The friend who wanted a ride usually got it, and usually more than his fair share of mud and water.

I think one of the prettiest sights is to watch one of the front wheels from the seat, rolling onward, never halting or stopping except at the will of its guiding spirit. The chassis, its springs designed to carry from twelve to fifteen hundred pounds in tonneau, baggage and passengers, takes no notice of the small inequalities of the road, but will plunge in an alarming manner at the larger ones, such as water-breaks and raised crossings, when taken at speed. The weight of the testing body, a hundred and fifty pounds or so, the tester and his kit as ballast, seated over the center of mass on the car, has very little effect in making things ride easy.

The chassis before being turned over to the road tester has been run under its own power for about twelve hours, the power being delivered through the driving wheels to a pulley of the same diameter. From its shaft a belt ran to a larger fan, which utilized the power in forcing cool air through the radiator, sufficient to keep the engines cool. This running generally left the motors pretty free, but the effects of vibration were just commencing to be noticed. The front tires were then put on, brakes adjusted, and the tanks for the water, oil and gasoline supplies looked after. The testing body consisted of the front seats of an old touring body, fastened on to a suitable framework, giving a runabout effect, with plenty of storage room, and was held in place by four bolts and clamps, a firm yet quickly removable fastening.

We then took the car out for about an hour's run, staying close to the factory; and, easing the car as much as possible, then returned and looked things over carefully. The bouncing and jarring of the road soon brought out minor troubles. The clutch spring needed more tension, the carbureter needed adjusting, occasionally a little dirt getting in the spray nozzle, and it was "then dismount it and locate the obstruction." The muffler cut out wouldn't stay open, steering gear and driving chains were loose. There are very many little details that require attention after the car has had a little bouncing over rough roads, giving the frame a chance to work a little.

One of the worst, and possibly meanest forms of trouble, was a nut holding the magneto timing gear in place. This

was drawn up on a taper, and, as often was the case, the nut was not quite tight enough and allowed the gear to slip, throwing the magneto out of time. The lubrication, all pumps wide open, kept the engines smoking, and if the oil was in the least degree too heavy—the motor requiring the lightest oil obtainable—it would be impossible to start the motor when cold without taking the anvils out and removing a carbon deposit resembling black enamel.

After looking things over we usually gave the car a run of from 25 to 40 miles. Road troubles were very few, being chiefly confined to resetting the ignition. My tool kit was the usual roll carried by thousands of motorists, and spare parts and springs for the ignition system, a few special wrenches, and spare tires and tools in the back of the testing body. Each car was kept on the road for about 200 miles, then given a final test up a steep hill by the head tester before being turned in. We made out a report on a printed form that called for information on every part of the car that could give trouble and exactly how it acted under test.

TESTING A MATHESON NEAR THE WILKES-BARRE FACTORY.

The performance of the cars on the road test varied considerably, some giving little trouble, others on our hands for over a week. I recall one car coming off the block test marked perfect, and I took hold of it one evening. When ready to start it I found a cylinder full of water. This I emptied, started the motor, and drove the car that evening to see if there was much else to be done in it. The leakage of water was so small that it would not affect the operation of the car. This trouble

was remedied next morning. By that evening it had developed a bad case of noisy gears, due to the bevel gears used in timing the camshaft at the cylinder head not meshing at their pitch line. This necessitated dismantling the radiator and a half day's work to make things right. After that the clutch gave trouble, not releasing properly, and was taken out a couple of times before the trouble was located. Between these troubles, then bearings, and other details, that car was on my hands for a week and a half. The next one went through with no trouble.

When passed by the head tester, the tires and testing body removed, the chassis was washed and then turned over to the head inspector's staff. With the tester's report as a guide, they went over the car thoroughly, trying every nut and bolt, throwing the springs (which had shifted slightly) forward into place to receive the weight of the tonneau, and giving particular attention to steering connections. The rear wheels were raised on jacks, and the motor run under its own power to observe the action of the clutch, gear control and gears. Then the crankcase and clutch were cleaned and lubricated, the gear and differential cases also cleaned, inspected carefully and filled with grease. The chains received attention, brakes looked after and adjusted, after which the gear case and hood were wired and sealed closed, and the control lever wired to its quadrant, and the car was ready for the body builders.

I have seen around a car a group consisting of the mechanical and testing staffs and the head inspector about

equally divided in their opinions as to whether or not there was a "knock" in the motor. The controversy ending by orders being given to take the crankcase and bearings down and examine them. Nothing was too small to pass if there was the slightest reason to doubt its being right. Cars never reached the stage of road testing lacking some little part essential to their satisfactory performance.

There is a pleasure in testing that the owner never experi-

ences. The motor not hampered by the weight of tonneau and passengers, or air pressure on mudguards, has a great deal more snap and speed. To tune a car to its highest efficiency, to remember that upon the performance of that car may depend many sales, calls for a high degree of skill and intelligence on the part of the tester. A conscientious and ambitious student and tester of to-day should develop into a high-class designer in the next generation.

FIGURES REVEALING AUTO'S GROWTH IN ALL COUNTRIES

A DECREASE of over one million dollars in American imports of automobiles is the most conspicuous feature of the world's statistics for the last financial year. To be exact, the United States took 102 less automobiles from abroad during the past twelve months than were bought in the year 1906, the reduction in value being \$1,358,880. Total imports from all countries for the past three years is as follows:

Year.	Cars.	Value.	Parts.
1905.....	490	\$1,866,402	\$136,057
1906.....	1,295	4,416,048	494,160
1907.....	1,093	3,157,168	650,408

France still remains at the head in number and value of cars sent to America, the total for 1907 being 835; Great Britain and Italy each have 91; Germany sent 53, and other countries together furnished 23.

Although America cut down her imports of foreign automobiles to a considerable extent, France managed to increase her exports by eight million francs, the total for 1907 being \$28,072,800, the largest amount ever recorded. England stands first in importance in French export trade, with a value of over \$10,000,000 for the past year, and is followed by Belgium, Germany and the United States. Argentina, Brazil and Algeria remain near the million dollar mark, all other countries being responsible for but small purchases. French imports show a decrease of one and a half million francs on the year. Italy heads the list, followed by Germany and Belgium.

What America Sells to John Bull.

LONDON, Feb. 1.—Great Britain imported 542 American automobiles at a value of \$1,775 each during the year 1906, according to returns issued by the Board of Trade. For the year 1905 the number was 559 cars and the value \$1,185 each. In 1904 the number was 568, at an average value of \$1,090. Although for the three years for which returns are available there has been a slight progressive decrease in the number of American automobiles imported into England, their average value has steadily increased to such an extent that the total for each year is always higher than the total for the previous twelve months. In 1904 the total value was \$619,120; for 1905 it had risen to \$662,415; and for 1906 the total was \$962,050. The proportion of the number of American automobiles to the total imported was 10.56 per cent., 9.95 per cent., and 9.4 per cent. for the respective years, the value being 5.94 per cent., 5.43 per cent., and 9.95 per cent. of the total value of the automobiles imported. The value of the parts imported from America was relatively small, being 3.44 per cent., 1.44 per cent., and .88 per cent. for each of the three years. As motor cycles were included in the years prior to 1904, and all vehicles prior to 1902, it is not possible to give figures for years before 1904.

Another phase of the automobile invasion into British life is the greatly enhanced value of horseflesh. Farmers have taken fright and stopped breeding, and, in addition, the South African war has depleted the stock with the result that there are now 12,312 fewer horses in the United Kingdom than was the case twelve months ago. The most convincing proof of the rapid decline of horse-breeding is shown by the fact that

the great proportion of the British decrease is in young unbroken horses. Figures published by the Board of Agriculture show that there has been a decrease during the past year of 10,451, or 7.6 per cent. As regards Great Britain the number of such young horses is the lowest reached since 1900, while taking England alone the number is the lowest reached since records were begun to be kept in 1896. In many quarters the question of military supply is looked upon as serious.

Reign of the Horse Ending in Paris.

PARIS, Feb. 1.—Foreign visitors to Paris will soon have no reason to pity the lot of the cab horse, and habitués of cheap restaurants will have to forego their luscious horse-steaks, if official figures count for anything. Every vehicle and every animal capable of drawing a vehicle is under obligation to the State for military service. Naturally a close watch is kept on all horses, and not a single "Dobbin" escapes the annual census. According to these returns, however, Paris now possesses but 83,458 horses compared with 92,026 in 1897, being a diminution of 8,568, or 10 per cent., in ten years.

The city has grown considerably in population during this decade, the decrease in horses being directly attributable to automobile traction. Not only have private individuals cut off the horse, but the cab companies have largely emptied their stables. The only omnibus company of the city shows a decrease of 3,972 horses owing to the introduction of automobile 'buses. At least 500 more should be added to this number, for early in January the company changed several lines from horse to mechanical traction. In time of war all omnibus horses can be requisitioned for work in artillery regiments; thus the loss of those from the Paris company alone means that several regiments would be without their full force. Such a change cannot but compel the army authorities to further develop the automobile service in all sections of the national fighting force. Recent events, indeed, have shown that the army no longer considers it prudent to rely on the horses obtainable by requisition in time of war, and are making strong efforts to develop the army automobile service to such a pitch that mechanical transport can be used entirely in transport work and to a limited extent in the artillery service.

Despite the enormous influx of taxicabs, the largest cab company in Paris has only diminished its horse force by 1,878 in ten years. In taking note of the figures, however, it should be borne in mind that the total number of vehicles has increased considerably during the decade. The greatest changes have taken place in the aristocratic residential quarters. Thus in the Champs Elysées district there were 4,473 horses ten years ago; the last census reveals but 2,878, or a reduction of one-third. The adjoining Monceau district shows a reduction of 1,318 horses used for pleasure during the same period. Latest statistics give the number of horse vehicles in the whole of France as 1,677,362, of which 226,600 are pleasure vehicles. As the number of automobiles is only 31,000, there is still plenty of room for activity on the part of the constructor.

LETTERS INTERESTING AND INSTRUCTIVE

LIMITING SPEED CAPABILITY OF CARS.

Editor THE AUTOMOBILE:

[1,153.]—This letter is sent to you to see if an automobile magazine is willing to open its columns to the discussion of an original plan, whereby the reckless disregard of automobile drivers for other road users' rights can be completely and effectively prevented. I propose that the different State and local authorities make it unlawful for any one to build, sell, or use automobiles capable of exceeding the maximum legal limit. I would like to have it explained to me why this would not be perfectly satisfactory to all law-abiding automobile users, while at the same time constituting a bar to the abuse of the roads.

M. A. TONKIN.

Louisville, Ky.

There are a number of most glaring defects in the scheme you propose, as a very little explanation will make clear. Moreover, the idea is not at all new, having been often suggested in this country and abroad, and having been as invariably given up by legislators and by its proponents, not only because of objections from automobile users, but also because of its proved inadequacy to bring about the results intended to be accomplished. In the first place, only the maximum speed limit is taken into account, with the result that any car capable of nearly reaching this is capable of greatly exceeding the lower speeds that are statutory for city streets, approaching corners and bridges, etc., and the enforcement of which is much more important than the enforcement of the speed limit on little-used country roads. Another difficulty that it would be hard to avoid would concern the question of speed down hill. For example, a car with a motor and gear ratios, making it impossible to exceed a certain speed under ordinary conditions, would nevertheless be capable of simply coasting at a highly dangerous speed under the most dangerous of all circumstances—on a long down grade. A final and conclusive flaw in your plan is the mechanical difficulty of arranging a car to conform to it. Any automobile with power enough to climb hills and to make fair speed over muddy or sandy roads must have power enough to go much faster than is ordinarily desired on good stretches of hard road and on slight down grades.

BETTER TO REBORE BOTH CYLINDERS.

Editor THE AUTOMOBILE:

[1,154.]—I have a two-cylinder opposed motor in my car. One cylinder is cut by reason of the pin through the piston having slipped. Would it be advisable to have that cylinder re-bored? The groove is probably 1-8 inch deep, which would necessitate 1-4 inch enlargement. In case I have same done could I expect good results, and should I have new piston or simply new and larger rings?

C. G. MOORE.

Sharon, Ia.

Where such a deep cut as this must be taken from the cylinder wall, though the cut would probably not have to be as great as you say, it is hardly advisable to have but one cylinder rebored, as a new piston would have to be fitted, and it would be found difficult to properly balance the engine, either mechanically or otherwise, in its altered condition. Unless the price of a new cylinder to replace the one damaged is prohibitive, or a new cylinder cannot be obtained, we should not advise this course, as reboring one cylinder would necessitate a similar operation to the other, as well as the supplying of new pistons for both, and these being of a special size, would doubtless have to be made to order, thus entailing considerable expense. It is further questionable whether the cylinder in question will stand reboring, or, if it has sufficient wall metal to do so, whether it will be of any value after this has been done. In case of reboring, both new pistons and new rings would be necessary.

RECHARGING A HIGH VOLTAGE BATTERY.

Editor THE AUTOMOBILE:

[1,155.]—Will you kindly answer this question through your "Letters Interesting and Instructive": I have a "Vestal" storage battery which requires 115 volts and 3 amperes for 20 hours to recharge. Would it be possible to charge it with a small dynamo having an output of 10 volts and 3 amperes if left connected for 240 hours, or 12 times as long, or can it only be done by having the voltages stated on the cell—115?

B. HARRY SMUCKER.

Belleville, Pa.

The number 115 is not the voltage of the cell, and as we presume it is employed for ignition purposes, this will not exceed six or eight volts. It is not the voltage that charges the battery, but the amount of current set through it, but if the voltage of the supply be not greater than that of the battery being charged, the latter will rise to a point where it overcomes that of the supply, and, in the case of a generator, is apt to reverse the polarity, or direction of the current, and then discharge itself through the outlet thus made. If the charging rate of your battery is three amperes the voltage of the current will not affect the time required so long as it exceeds that of the battery itself, so that if your battery does not exceed eight volts you can charge it with a current of three amperes generated by a 10-volt dynamo in the same time as with the 115-volt current. Where the difference in voltage is so small the cells should be watched to guard against reversing as the charge approaches completion.

COVERING BRIGHT BRASS WITH VARNISH.

Editor THE AUTOMOBILE:

[1,156.]—Can the brass on radiators, dash rails, acetylene, and oil lamps be painted with ordinary paint and varnish such as bodies are finished with? Must brass be previously prepared in order to make paint stand successfully? Is heat of lamps sufficient to damage paint on their exterior?

J. A. C. K.

Newburgh, N. Y.

We have never known carriage varnish to be applied to brass and doubt whether it would make a good job, if it be desired to retain its brightness. However, it may be painted with any ordinary varnish or paint, and the latter will adhere permanently if the brass be thoroughly cleaned previous to its application. The best method of doing this is to rub the parts in question with a weak acid solution, vinegar and salt, or dilute sulphuric acid and water being employed, and every particle of foreign matter being removed. This is then followed with a liberal application of warm water, or soap and water, to remove every trace of the acid, the brass finally being polished dry with a clean cloth. It is then ready to be painted. In finishing brass to retain its polish a similar cleaning process is gone through, and it is then covered with a transparent lacquer especially made for the purpose.

DOUBLING THE PROPELLER SPEED.

Editor THE AUTOMOBILE:

[1,157.]—Will you kindly advise me as to your knowledge regarding motor boats? For instance, we have a 30-foot boat with a three-cylinder two-cycle Barber Bros. engine, which runs about 500 r.p.m. Could this engine be made to turn the propeller, which is 18 inches, twice as fast as it is now turning? By putting two sprocket wheels, geared 2 to 1, running by a chain on the main shaft behind the clutch? If so, do you think this would be advisable and would it work satisfactorily? Also do you think it would put twice the strain or twice the power which it now takes to turn it after the boat is under full headway, not counting the excess power it now has? I understand that it would take twice the power to start it, after it was in motion; would it? The bore of the cylinder is 4 1/4 by 4 1/2.

C. H. B.

Bradford, Pa.

We think such an alteration as you propose to be impracticable for a number of reasons. You do not give the pitch

or other details of the propeller, and without these it is impossible to say whether such a propeller as is now fitted to your boat could be run at a speed of 1,000 r. p. m. without causing cavitation, *i. e.*, creating a vacuum in its plane of revolution instead of impelling the water from it and thus forcing the boat ahead. The chances are that it could not be so run, and that instead of gaining speed you would lose it while the engine raced to a greater or less extent. Granting, however, that this disadvantage were not encountered, it is doubtful if the motor has the capacity to carry considerably more than 100 per cent. overload, as it has doubtless been fitted with a propeller suited to its power, and doubling the speed of the propeller does far more than double the amount of power required to turn it, owing to the greatly increased resistance at higher speeds.

Nor do we think that the plan of running the propeller by sprockets and chain a good one and would not advise it, as we do not think it would prove satisfactory in service. As already mentioned, it would take more than double the power now required to run this propeller at twice the speed, whether starting or with the boat under full headway, granted that it would be able to attain its normal speed in view of the slippage of the propeller that is apt to occur. If it be desired to increase the speed of the boat to the maximum, we should advise fitting a larger propeller, or one having a greater number of blades, or of a different pitch, or both. The best authority to apply to for information on this point would be the maker of the boat, as he would know just what it and its power-plant are capable of and could advise accordingly. Such an experiment as you contemplate, however, would scarcely prove satisfactory.

A MODERN FABLE OF THE CYLINDERS.

Editor THE AUTOMOBILE:

[1.158.]—I have been very much interested in the 1-2-4-6 cylinder controversy. Have read with pleasure the comparisons made by the different gentlemen of different opinions. The four-legged horse, the two-legged ostrich, and the comparative wheel base (from our Los Angeles friend), but as yet no one seems to have settled the matter satisfactorily. If it is not asking too much of your valuable time, I would like to have you read the following little story and before reading please remember that there are a lot of things between the lines, not mentioned:

Once upon a time, it happened that a man got a job carrying mail from a railroad station on one of our western roads to a country four corners, situated about 20 miles from the railroad, in a very productive locality. So he bought himself a single-cylinder mule and a two-wheel cart. His trip was a tri-weekly affair and he experienced no trouble making his route on time, in fact, near this four corners was a lake, well stocked with bass and pickerel. The job was so easy that he had plenty of time to catch a mess of fish for himself and many times for his friends.

As the country grew in numbers, there was now and then a man who would want a ride to the station, but on account of his two-wheeled cart and one-cylinder mule, it was not very satisfactory to his patrons to be bumped and jerked for twenty miles over roads that were none too good, so he bought another single-cylinder mule and a two-seated buckboard. His patrons liked the improvement in transportation so well that his business increased so fast he was unable to carry all his passengers. He, however, continued to fish in the nearby lake, but not so often as when he drove the one single-cylinder mule.

Being a progressive man, he couldn't help seeing that if he wanted to do business and please the patrons on his route he was due to do something, so he bought two more single-cylinder mules and a four-in-hand coach. He also built a manifold manger and fed the mules singly one at a time, all from one oat bin. He used the make and brake, except when he got in a hurry, then he used the jump to better advantage.

Business increased, but owing to his extra work on the four single-cylinder mules and keeping the four-in-hand coach greased he found little time to fish, but that did not worry him as with his increase in revenue he could hire a boy to catch his fish. The only thing he lost was the fun of spitting on his bait and seeing the fish flop when he pulled them in.

But the country kept growing and consequently he had more people piling into his coach and the loads got so heavy for his four single-cylinder mules that every week or two he would come in with a missing mule. This caused a kick from the patrons, as they did not like being late to dinner and they blowed so hard it set our

mule-chauffeur working his thinking machinery. Something had to be done.

The work was certainly too strenuous for the four single-cylinder mules, yet his four-in-hand coach was capable of carrying more passengers and finally he figured out that it would not be amiss to buy two more single-cylinder mules, which he did and there was great talk throughout the country around. He lowered his running time to such an extent that his patrons asked him why in the dickens he hadn't done it before. There was such an improvement in the movement of the coach that his passengers would fall asleep and the consequence was that he had to strap them in or else stop and pick them up when they dropped out.

One fine day, his old friend Bill made up his mind that he would ride into the city, so he climbed to the driver's seat, so he could have a good view of the scenery and incidentally a little visit with our worthy mule driver. They were just passing the lake near the four corners and Bill saw his old friend's longing glances out over the lake and Bill said, "Say, old man, how is it I never see you fishing any more?" "Fish?" says Bill, "I'd awfully like to pull in a few, but I'd like to see a man buckle the croopers under six mules' tails, water and feed and clean and attend to keeping them all shod, besides keeping this blamed four-in-hand coach oiled and cleaned and look after the welfare of all these passengers and then find time to fish. Do you know, Bill, I often long for the good old days when I drove the one single-cylinder mule."

Cadillac, Mich.

C. E. HAYNES.

FROM THE STANDPOINT OF THE CHAUFFEUR.

Editor THE AUTOMOBILE:

[1.159.]—I see by your last edition that you have a piece about the chauffeur who was inexperienced and about a "prospect" who was getting a demonstration and met with an accident on Michigan avenue. Now I am going to mail you one of our applications, and you can see for yourself what we are trying to do. We also have an examining board, and they must pass 75 or better or they are rejected for three months, and he must also drive a car for one year or more before he can get an application. I don't think anyone is to blame if an owner wants to hire a man who does not know what an automobile is or does not know what is under the hood; all he knows is to drive it. Now, you take nine-tenths of the cars that are on the market to-day and they are bound to run, and run right, if the man that is on the position knows how to take care of the motor and not waste his time in playing cards and going to the saloon next door.

There are drivers in Chicago that the minute they hear something going wrong, they stop right then and there and fix it. At the same time there are others who would say to their employer (who has also noticed that something is wrong): "Let it go; I will fix it when I get home." Now, if he lets it go, it might run into something more serious, and what he could have done in five minutes on the road will now take him two or three days to do, and at an expense of maybe \$200 to his employer. And another thing we are trying to do, and that is to do away with the man that poses as the owner of the car, or as you all know, the railroader. We have what you call a judiciary board, and they will deal with those drivers as they should be dealt with. We want the support of all the owners and dealers in Chicago if we can get it, and in return we will show them the chauffeur is not so black as painted.

Now, I know where there was a man put on a new car who had never driven a car before, only at one of those motor schools, and in four months he was discharged and the car had to go into the shop and be overhauled at the expense of \$250; and there was another man put on the car like the first one, just to save \$5 a week. In another three months the car will have to have another overhauling, at another expense of \$250. I have looked up these two drivers, and I can truthfully say that both of them got their knowledge out of one of the motor schools here in Chicago. The first man I speak of was recently put on a new car just from the factory, and a more difficult one than the first one, and I suppose that one will be ready for the shop in about three months. I rode downtown the other day in that same car, and I watched the sight feed (oil) on the dash, and I saw that it was not feeding enough oil and I mentioned it to the driver and he said: "To h— with it; I am not going to bother making another adjustment on it."

There are owners in the city who have gotten in conversation with some other owner, and he will tell the other owner that he gets his driver for \$75 a month and his man leaves him, and then No. 1 tries to get a man for \$75, and succeeds in getting one like I told you about. While, on the other hand, his first man always had his car in A-1 shape and was always ready when he was called.

I wish you would call that writer's attention—Fred L. Morgan—that just such a move has been started, and we mean to keep it up. Our examining board is of five drivers who have been in the game for at least five years, and I can truthfully say that there are three of them who drove cars here in 1900.

I think if we can show every one connected with the game that there are good chauffeurs in Chicago they will try and help us get

a bill passed at Springfield to make all drivers stand an examination of some kind before they can get a license, and then you will find that nearly all of the accidents will stop. It was shown for itself that nine times out of ten that where an accident occurred that the driver was a new one, and did not know his business.

Now, I hope you will give this your attention, and a little of our association in your paper once in awhile will do us a world of good. And please mention that we are going to give a smoker to the dealers here in Chicago, and lay our plans before them and see if they won't help us and give us their support. And when we get that, we will go ahead and clean Chicago of the poor chauffeurs.

We have got a sick benefit from which we pay \$6 a week to a single man and \$10 to a married man who is sick from other causes than liquor.

Chicago, Ill.

EMMETT H. WALLER.

IN EXPLANATION OF THE MYSTERY.

Editor THE AUTOMOBILE:

[1,160.]—In reply to No. 1,141 of "Letters Interesting and Instructive" will say if the cause is not in the lack of proper circulation or in the wiring, it must be a growth of carbon reaching one point of the plug. This in connection with a certain wiring will ruin as many plugs as inserted, or in the wiring exclusively. If you had stated what was used and how (dry cells, coil, or generator) could have given a clearer idea.

Darlington, Md.

SELFE & WHITEFORD.

Editor THE AUTOMOBILE:

[1,161.]—In reply to your reference of two-cycle, No. 1,141, in "Letters Interesting and Instructive," would say that providing that his spark plug screws in tightly and does not leak, there can be only two things possible, that I can see, and that is pre-ignition, or else his exhaust pipe or muffler is very nearly stopped up with a formation of salts caused by carbon and salt water, generally found in an elbow. I have seen the same thing puzzle at least four experts from two different factories; two from the factory where the engine was made, although this was a four-cycle. They took the carbureter off, and blamed that, put on a new one, and this did not help any at all, so they put on a new magneto and still it was the same story; then they told the owner that he would have to get a new engine; apparently at the end of their rope; after working for two weeks. This the owner refused to do, as he had only used the boat two seasons and had taken the best of care of the engine, it showing no perceptible wear anywhere, and he would not spend the price of a new engine to find out the trouble. He asked me to spend a day on it, as a day more or less would not make any difference, so I did. I found the compression good, ignition and timing nearly perfect. Then I started up the engine, which she readily did, but upon taking about 12 or 14 explosions on both cylinders, she started to miss on the rear cylinder, and no matter how I tried she would not fire it unless I stopped and started her over again, when she would repeat the same performance. Then I took off the exhaust pipes and instantly the engine fired both cylinders, which conclusively proved excessive back pressure, and upon disconnecting the exhaust, found one of the elbows completely stopped up with carbon salts, having only an opening as big around as a lead pencil, to exhaust through, which was very hard to clean out, having to use hammer and chisel, and on being put back the engine ran as good as when she was new. I then put back the condemned carbureter and magneto, and it did not make a particle of difference, the engine running just as good.

Hicksville, L. I.

FRANK SCHWARZENBERGER.

Editor THE AUTOMOBILE:

[1,162.]—I have noticed Inquiry No. 1,141 in your January 30 issue, and if suggestions based on fifteen years' experience as gas engine ignition expert are acceptable to "Two Cycle," I am pleased to offer them. I am sorry we are not informed whether the two-cylinder two-cycle 11-horsepower motor is supplied by a single carbureter, or by separate ones for each cylinder, but will assume first that the former condition exists. In this case it is probable that the inlet valve in the rear cylinder opens more freely or wider than the one in the forward cylinder, so that a larger amount of mixture enters base and results in higher compression with consequent higher temperature in the cylinder. Attempts to regulate mixture results in this cylinder getting a so-called "lean" mixture, which maintains its heating power through a wider distance than does richer mixtures. This difference being due to the fact that forward cylinder suction cleans out the carbureter without pulling fuel enough for the next suction which, of course, goes to the rear cylinder, leaving a rich deposit in passage for the next forward suction.

If separate carbureters are used, the difficulty will be reduced by feeding a little extra fuel to rear cylinder.

Other prolific causes of such difficulties are: a partially clogged exhaust in either cylinder; a partially clogged inlet-port in other cylinder, or possibly a variation in head castings, whereby the rear plug might extend farther into the combustion space. The spark

points should extend slightly past inner wall under ordinary conditions, but if the plugs have an air space of liberal size, and points heat up, the plugs might be shorter, but not so much as to cause miss-fires. I have assumed that ignition current and timer are working perfectly, so that miss-fires are not occurring in forward cylinder and keeping temperatures and speed down.

These ideas may be sufficient, but if "Two-Cycle" cares to write further particulars, the writer will take pleasure in giving the matter further attention.

New York City.

F. J. WATT.

A LAYMAN'S VIEW OF THE MATTER.

Editor THE AUTOMOBILE:

[1,163.]—I have read with considerable interest the long drawn out controversy taking place in your columns between the exponents of the fours and sixes, and which is very interesting from a theoretical viewpoint. But it seems to me, being a layman, that there is something now due the public-laymen—on the practical side of the question. It seems like a ridiculous and ludicrous position in which are placed so-called mechanical engineers and automobile experts—men whose mechanical training should have pre-determined, without asking the public to bear the experimental expense, the proper solution of the problem. The writer is fully cognizant of the fact that it is only through the friction of ideas that true progress is made. But why impose the expense of this experimenting on gullible people?

But from the glaring imperfections that have obtained in the automobile business up to the present time, it is very patent that the engineers know very little more, if any, than their customers about what should be embodied in a machine. The old maxim, "Be sure you are right, then go ahead," should apply especially to the automobile industry, and cars should be thoroughly tested out and sold on their merits, and not on promises and claims which fall to be fulfilled by the car.

We have a condition in the trade to-day which presents two radically different opinions. Some manufacturers claim fours as the standard and acme of perfection as regards number of cylinders of the four-cycle type. Others maintain all the virtues of the sixes. There is a way of proving this. The A. C. A., in its New York clubrooms, has just installed what is perhaps the most complete experimental equipment on automobile work in this country. I am now going to suggest a sane, reasonable and equitable proposition, and one to which I believe any honest, sincere, and well-meaning manufacturer could take no exception; but one in which I do not believe any two makers will concur, for obvious reasons, viz.:

Let each exponent of his favorite model—the two foremost exponents of the four and six, respectively, submit a stock car of their own selection to an impartial committee of the A. C. A. testing and experimenting. Give this committee full power to test the cars in whatever manner they choose for the different points of efficiency in which they claim to excel, always, of course, submitting both cars to the same test. Give the results of tests on all points in which the public or engineers are interested. Wear the cars out, if need be! It will be disastrous for the loser; therefore, I despair of the contest, but these are matters on which buyers should be informed, so let the fittest survive without needless expense to the public.

Whether automobile manufacturers admit it or not, the handwriting on the wall proclaims that the high-priced automobile market is limited, and that from this time on many manufacturers must look to the so-called middle class for their patronage. This class of buyers have no leisure money. They are the ones who sign checks for value received, and must "be shown."

Why not cease all this useless and senseless bickering and quibbling and get down to facts, which can easily be obtained by practical work and tests? The publicity managers have had their inning at the expense of the rich and affluent. Now let the practicability have a chance. Money talks! So do figures! Give these a word and some of the publicity managers can be dispensed with.

The writer would like to have "The Automobile" secure statements on this proposition, and publish their replies in its columns. It should be interesting reading, and would be a service for which more of your readers than the writer would thank you.

Detroit, Mich.

AN INTERESTED READER.

FOR CALCULATING COMPRESSION VOLUMES.

Editor THE AUTOMOBILE:

[1,164.]—As a subscriber to your publication, I would like to make a correction to No. 1,120 of your "Letters Interesting and Instructive." If you will go over your calculation you will find your arithmetic has gone amiss. Also you have used the wrong formula. $P_1 V_1^n = P_2 V_2^n$ or $PV^n = K$ a constant, are two forms of formula used for calculating compression space in which $P =$ pressure, $V =$ volume, and n is an exponent of V , whose value depends on the gas being used.

Using your own symbols. Let $V =$ volume swept out by piston or piston displacement, and $C =$ compression space. Then $V + C =$

total volume gas in cylinder at completion of suction and this is compressed into space C.

Now Mr. Allen wants 75 pounds compression, and I assume that he means gauge pressure, as that is nearer common practice for automobiles. Then the absolute pressure would be 75 + 14.7 = 89.7 pounds or say 90 pounds in round numbers.

Now applying the formula, $P_1 = 14.7$ and $V_1 = V + C$, $P_2 = 90$ and $V_2 = C$, so that substituting we have $14.7 (V + C)^n = 90 C^n$.

$$\text{or } \frac{(V + C)^n}{C^n} = \frac{90}{14.7} = 6.122.$$

Now for a value for the exponent n, 1.3 is about what is used for gasoline vapor mixed with air. Then our formula reads:

$$\frac{(V + C)^{1.3}}{C} = 6.122 \text{ or } \frac{V + C}{C} = (6.122)^{\frac{1}{1.3}}$$

$$\text{Log. of } 6.122 = .7869$$

$$\text{“ “ } (6.122)^{\frac{1}{1.3}} = \frac{.7869}{1.3} = .6053$$

$$\text{Then } (6.122)^{\frac{1}{1.3}} = 4.03$$

$$\text{Then } \frac{V + C}{C} = 4.03 \text{ or } V + C = 4.03 C$$

$$\text{or } V = 3.03 C$$

$$\text{or } \frac{V}{3.03} = C$$

$$\text{or } C = .33 V = 33 \text{ per cent. of piston displacement.}$$

RATIO OF COMPRESSION SPACE TO DISPLACEMENT.

From this, by substituting values for D and L in the formula $V = \text{piston displacement} = .7854 D^2 \times L$, in which D = diameter of bore in inches and L = stroke in inches, the compression space for any diameter and stroke can be found.

I am enclosing blue print of curve showing relation between compression space and compression pressure in gasoline engine. This curve was plotted by formula given above for every five pounds between 25 degrees and 125 degrees, thus giving complete data over a wide range, and facilitating the finding of this factor without extensive calculations.

You will see that the ratio of compression space to piston displacement opposite 90 pounds absolute compression pressure is .345 or 34.5 per cent. of piston displacement. The discrepancy occurs in using 1.33 for value of exponent n.

Flint, Mich.

PERCY F. TODD.

ABOUT BRAKING WITH THE MOTOR.

Editor THE AUTOMOBILE:

[1,165.]—Referring to Elmer Willard's question in the January 30 issue, regarding the use of the engine as a brake, I would mention that the Safir Motor Company, in Zurich, Switzerland, takes advantage of this by means of a special appliance. The carburetor is controlled by a lever on the steering wheel. This same lever on the steering wheel when rotated in the opposite direction has the function of shutting off the gasoline supply from the carburetor, opening the carburetor air passage and changing the timing of the exhaust valves of the motor with reference to the crankshaft position, thereby transforming the motor temporarily into an air compressor. In order to secure the maximum braking power, which is 75 per cent. of the motor power, the exhaust valves are opened by means of a shifting cam at a period when, under the normal operating condition of the motor, the explosion stroke would commence and the operating cycle would follow, thus:

1. Admission of air through inlet valves.
2. Compression of air with valves closed.
3. Opening of exhaust valves at top dead center and exhaust of compressed air. Re-aspiration through exhaust pipe under atmospheric pressure.
4. Compression of air with valves closed and opening of inlet valve on top dead center and release of compressed air, followed by the same series of air admission, compression and exhaust.

By gradually altering the timing of the exhaust the braking power can be varied at will from zero to the maximum.

The advantages of this form of braking are self-evident, the principal being the extreme flexibility of control, cooling and cleaning the motor with fresh air, elimination of heat and wear always present in friction brakes, and reduced tendency toward skidding.

In Switzerland I have driven one of these trucks, with full load, down a 10 per cent. slope on second without any other brake.

Chicago Ill.

FRANGOTT HUBSCHER.

IT WAS 387.09 MILES FOR A GALLON OF OIL.

Editor THE AUTOMOBILE:

[1,166.]—On returning from a month's visit in Washington, I looked through the numbers of "The Automobile" that had come during my absence, and saw in your issue of January 16 a letter signed "Munchhausen," in which the writer thereof questions the accuracy of my statement to the effect that I averaged 387.09 miles to a gallon of cylinder oil. In reply to his letter I would say: (1) That before sending to you that expense account of my car I went over all the figures twice and found them to be correct. (2) I have been over them again, and have again found them to be correct, having again referred to my two books. (3) I have a Veeder odometer on my car, which enables me to know exactly the distance traveled. (4) In the two books that I keep I always enter the time of putting oil into the crankcase and the exact amount poured in, and also the total amount of oil purchased. The two books thus form a check the one upon the other.

I note that Munchhausen says that he is running a car similar to mine in all respects but one—his being a runabout and mine a touring car—and that when he averages 100 miles to the gallon he thinks he is doing well. That leads me to believe that his car is not of the same make as mine, because to the best of my knowledge and belief the firm that makes my car has never in all its history turned out an air-cooled runabout. This year they are making a 40-horsepower water-cooled roadster besides.

If Munchhausen thinks that my oil figures are still "so obviously an error" and desires further light, I can give him the names and addresses of three people in my town whose experience as to oil consumption and freedom from trouble and repairs has been practically the same as mine. They are using the same make of car.

East Orange, N. J.

A KICK FROM THE RETAIL DEALER.

Editor THE AUTOMOBILE:

[1,167.]—I think the manufacturers of automobiles have a "big kick" coming from the legitimate dealers, and particularly those who have signed contracts for a certain number of cars for the season. It is the custom of most manufacturers to arrange with any person, "Tom, Dick and Harry," without regard to what business he follows, to represent them in a given territory, provided he will order from one to three or four cars. The result is he will get two or three of his friends or persons to form a club and they will each get their cars at wholesale price and the dealer is left out, as he must sell his cars at a profit to live; in fact, he must agree not to sell below the list price, under penalty of losing the agency. But what does the doctor or lawyer care so long as he gets his car at wholesale price?

Is it not about time that the manufacturer recognized the regular legitimate dealer, and not establish agencies with persons who are not in the business?

Watertown, N. Y.

AUTOMOBILE DEALER.

BROADWAY ENTRANCE TO BUILDING.

THE ATTRACTIVELY FURNISHED SALESROOM AND ITS MANY CARS.

A REPRESENTATIVE NEW YORK HOUSE.

Though the development of the automobile has been extremely rapid, within the past few years facilities for housing it have been advanced at such a rate that the modern garage building is now a fitting home for the up-to-date car. That such an amount of money as is now invested in one of these buildings would ever be spent for that purpose would have seemed inconceivable but a few years since, and the number that have been put up is one of the strongest indications possible of the confidence prevailing in the future of the industry. The latest to reach completion, and likewise one of the most strikingly representative buildings of its kind, is the new establishment of the Palmer & Singer Manufacturing Company, located at 1620, 1622 and 1624 Broadway, and extending through to Seventh avenue, New York City. The building is constructed of solid, reinforced concrete, making it absolutely fireproof, and it is said to be one of the best-equipped establishments of its kind anywhere in the country.

Departing from the usual practice, the cellar has been utilized for a second washing room, being equipped with turntables and a washstand. It also contains three pits for the making of ordinary repairs such as would not necessitate sending the car to the repair shop in the upper part of the building, while buried beneath it, six feet underground, is the gasoline storage vault, fitted with six Bowser tanks and walled off by a fireproof partition from the remainder of the

building. In another section of the cellar are the boiler rooms and the motor rooms, both being walled off in the same manner. Another part of the equipment is a series of oil tanks with overhead cranes to facilitate handling barrels of oil of different grades. A high-pressure pump for feeding the roof tank and providing fire protection through its connection to the hose outlets on each floor is also located in the cellar, access to which is gained by means of the two large electric elevators. The latter have a capacity of six tons each and communicate with every floor of the building.

The salesroom is located on the ground floor, facing Broadway. As will be seen from the photograph, it has a capacity of several cars, with plenty of room to spare, and is one of the most attractively finished rooms of its kind in the city. The permanent display consists of 50-horsepower Simplex cars, three cars of the Palmer & Singer line, the "Six-Sixty" six-cylinder runabout, the "Four-Forty" touring car and the town car, also the Selden 28-horsepower touring car. Flanking the salesroom are toilet rooms and a ladies' retiring room, fitted with every modern convenience and beautifully finished. Behind the salesroom and occupying the remainder of the ground floor is the garage, entrance for cars being had by means of an extra wide door at the Seventh avenue end. By means of a special pump equipment the gasoline is raised from the cellar vault and transferred to small, portable, automatic measuring tanks of the Bowser type,

VIEW ON THE THIRD FLOOR SHOWING ITS GREAT CAPACITY.

LIFTS THAT CARRY THE LARGEST CARS.

WHERE ALL PLANS ARE PUT ON PAPER.

which can safely be taken anywhere in the building. The superintendent of the garage also has his office on this floor, and there is a complete turntable and washroom equipment.

Running around three sides of this entire floor is a gallery carrying more than 150 lockers for drivers and owners, and having sufficient capacity to store clothing and spares. Access to this gallery is only to be had from the mezzanine floor of the salesroom, on which the business offices and fireproof vault for books and records are located. At the Seventh avenue end of the ground floor is a platform for the checkers, who keep track of the movement of every car.

The private offices of the company extend across the Broadway front of the second floor, and this may also be utilized as a salesroom. Behind this is another garage floor, and at the Seventh avenue end is the chauffeur's clubroom, containing a barber shop, two pool tables, shower baths, music room with piano, card room and a "temperance" bar. The third floor is devoted entirely to storage and has a capacity of more than sixty cars, besides having turntables and washstand like all the others. In fact, most of the washing will be done on this floor, so as to keep the others dry. The fourth floor is devoted entirely to storage, while the fifth floor is taken up by the machine shop, draughting room and combined stock and tool room. The machine shop occupies the major portion and is of such size that twenty cars may be under repair at once. The power-tool equipment is the most complete of its kind and includes every possible facility for the quick handling of cars. There are four full-length pits on this floor, so that that number of cars may be so placed as to be subject to examination from beneath at any part without the necessity of crawling under them.

WHO WOULD NOT BE A CHAUFFEUR HERE?

KEYSTONE MOTOR CAR CO.'S NEW BUILDING.

PHILADELPHIA, Jan. 6.—Perhaps the feature that most impressed visitors at the recent opening of the new garage and salesrooms of the Keystone Motor Car Company, 216-220 North Broad street, this city, was the commodious appearance of every portion of the building. From the show room on the first floor to the machine and repair shop on the fourth floor there is every evidence of a judicious distribution of space. In the first place, the ceilings are high, the floor spaces are clear of any obstacle that might obstruct the view, and there is not a corner that is not flooded with light.

Entering the Broad street front show room, the visitor finds the cement floor covered with Persian rugs, artistically laid. To the right, just back of the mammoth windows, are displayed a number of 1908 Packards and Buicks, for which the Keystone Company is the Philadelphia representative. On

the left are the desks of the sales force and the accessories department. A spacious stairway takes the visitor to the balcony overlooking the show room. In the rear of the show room, doubling sliding doors connect to the garage room in the rear. The garage room is entered by a 40-foot passage in the rear from Carlisle street. There is no car entrance from Broad street.

The general offices on the mezzanine floor are finished in mission style, and the private offices of President Edward H. Godshalk and General Manager Clarence Godshalk are also located there. Nearby is an invitingly furnished ladies' room. The rear portion of the second floor is devoted to chauffeurs' quarters, fitted with every modern convenience. The gallery in the rear portion overlooks the garage room below.

The third floor is a single room, occupying the entire length and breadth of the building and is used as a stock room for cars, and the fourth or top floor is an admirably equipped repair shop and stock room. Large elevators connect all the floors and are capable of handling the largest closed cars with ease.

EXTERIOR OF NEW KEYSTONE GARAGE.

ADMIRABLE ARRANGEMENT OF THE FIRST FLOOR FOR STORAGE.

NEW CATALOGUES THAT HAVE BEEN RECEIVED.

Locomobile Company of America, Bridgeport, Conn.—An excellent example of a trade catalog is provided in the publication of the Locomobile Company, descriptive of 1908 models. With text produced in black and red, the catalog is further embellished by colored engravings showing the finish of a number of Loco lines. That part of the book dealing with mechanical features of the new models is in sufficient detail to be valuable, and is at the same time so clearly written and well illustrated as to be understood by those with only limited experience. A pictorial representation of touring scenes in different parts of the world, with a Loco always in the foreground, adds considerably to the general interest of the book. A further publication from the same firm is an 1908 Locomobile color card issued with the assistance of the Murphy Varnish Company. This has been sent out as an aid to customers in ordering colors for new cars, and will be found useful as a supplement to the eight different color schemes shown in the firm's catalog.

Lozier Motor Company, New York.—The handsomely produced two-color catalogue of Lozier 1908 models, sent out by the Lozier Motor Company, New York, will appeal to a public desirous of getting real information on the make-up and design of this car. Descriptions are to the point and complete, and are further helped by numerous half-tone illustrations of various parts of the cars. The catalogue, which is printed on heavy book paper, has an embossed cover design showing the two crack Lozier drivers, Michener and Mulford. There are also a number of illustrations of scenes in twenty-four-hour and other contests in which Lozier took honors. A further publication from the same house is in the form of a little booklet based on a number of extracts from a recent number of THE AUTOMOBILE. Comments after each extract show how the Lozier has always led in design and construction.

De Luxe Motor Car Company, Detroit, Mich.—From cover to cover the catalogue produced under the title, "The Car De Luxe of To-day and Cars of Olden Times," is one of the most original as well as the most artistic of trade publications which have made their appearance this year. Excellently printed in two colors, each page gives a glimpse into the past and shows something of the present day product of the factory of the Detroit firm. It is in reality an artistic review of the progress of mechanical locomotion—a review got up in such excellent style as to commend itself to everybody.

Cullman Wheel Company, Chicago.—Forty-eight pages of closely printed matter are required to describe all the lines produced by these manufacturers of automobile and machinery sprockets. Among the features which attract attention are rear wheel sprockets and brake drums, also counter shaft sprockets for buggy automobiles. Another good line is the Cullman spur gear differential, which embodies among other new features an oil retaining shoulder and solid steel hardened pinions.

Supplementary Spiral Spring Company, St. Louis, Mo.—"Missouri Proof," consisting of a batch of letters from satisfied users of supplementary spiral springs, carries a strongly convincing message. Every one of the twenty letters reproduced contains enough praise for the device to convince the most skeptical. In issuing the booklet the firm declares that not one of the persons writing in praise of the springs is known to them or connected with the works in any way.

Morgan & Wright, Detroit, Mich.—The two chapters in the advance catalogue of the well-known Detroit tire firm are headed respectively "In General" and "In Detail," the former dealing with some of the generalities of tire construction and the latter showing the different lines produced by Morgan & Wright, comprising the Bailey, Midgley, flat and

plain treads. What some people have been able to do with these tires is told in a couple of pages of testimonials.

Standard Roller Bearing Company, Philadelphia.—Some of the various types of tapered and straight roller bearings, annular ball bearings, ball and roller thrust bearings are dealt with in the automobile show catalogue of this firm. But the activities of the company are not limited to this, some of the other features mentioned in the illustrated catalogue being gear blanks, drop forgings, front and rear axles and transmission gear.

Adams Company, Dubuque, Ia.—"The Sages," a handy little folder about the Adams-Farwell revolving air-cooled motor, does not deal much with technicalities or present any illustrations, but is none the less interesting for all that. It is but a series of pointers on the features of the Adams-Farwell, served up in such a way that one is tempted to ask for more particulars.

Rock Island Tool Company, Rock Island, Ill.—Catalogue "D," just issued, deals with this company's very extensive line of vices, all of which are described and illustrated. One of the most attractive things in the catalogue is an automatic self-locking swivel vice, which, with no more parts than the ordinary stationary vice, offers immense advantages over this latter.

Hartford Rubber Works Company.—A feature of the colored booklet of this company is a series of illustrations showing how Hartford solid tires are employed on every type of mechanically propelled and horse-drawn vehicle. In addition to a talk on Hartford excellence, there is some useful information on how to mount these tires on their rims or dismount them.

Raines & Co., New York.—Four bright little maidens symbolize the brightness produced by Globe metal polish, on the colored hanging calendar for 1908, produced by the makers of that indispensable garage toilette preparation. Raines & Co., 50 Ferry street, New York, makers of Globe polish, will doubtless be willing to supply copies of the calendar on request.

Motz Clincher Tire & Rubber Company, Akron, Ohio.—As evidence of the value of their cushion tire, this firm has published a chart obtained after a series of comparative tests by an electric vehicle firm with several makes of tires. The inquiry was entirely disinterested and the favorable showing of the Motz is therefore all the more worthy of attention.

Nordyke & Marmon Company, Indianapolis.—A view and description of the factory at Indianapolis, Ind., a review of the structural features of Marmon air and water-cooled models, and specifications of the various types of cars comprise the main features of Marmon catalogue No. 830-A. Several illustrations are given of the complete cars.

Eldredge Electric Manufacturing Company, Springfield, Mass.—A catalogue of battery testing instruments recently sent forth comprises pocket voltmeters, ammeters, voltammeters, spark-coil current indicators, miniature switchboard instruments, etc. Each instrument is illustrated, described in detail and price given.

Gilbert Manufacturing Company, Hartford, Conn.—The catalogue for the 1908 season shows all the well-known lines of leather and metal goods for automobiles, as well as a number of novel features likely to be valuable on any car. Gilbert high quality is declared to be maintained in all standard and new lines.

R. M. Owen & Company, Lansing, Mich.—There is a convincing air in what the catalogue compiler has written on the Reo family for 1908. There are five of them, from a little single-cylinder runabout to a comfortable four-cylinder side entrance touring car. Parts and complete cars are freely illustrated.

ANOTHER EFFORT FOR A NATIONAL HIGHWAYS COMMISSION

WASHINGTON, D. C., Feb. 10.—Automobilists throughout the country will undoubtedly accord hearty support to the bill introduced in Congress by Representative Currier, of New Hampshire, the object of which is to create a National Highways Commission, and for the construction, improvement, and maintenance of public highways. The plan suggested by the Currier bill is a novel one and if it is enacted into law will work wonders in improving the condition of the National Highways.

The proposed commission is to consist of three members, to be appointed by the President of the United States, who are to receive a salary of \$5,000 a year, and can only be removed from office for cause. It will be the duty of the commission to take into consideration, formulate, and adopt such plan or plans for the improvement, construction, and maintenance of such public highways, the improvement and maintenance of which shall in the judgment of the commission, acting in cooperation and consultation as far as possible with the duly constituted authorities having

charge of the highways of the several States, promote and facilitate inter-state commerce and trade and the postal service.

The commission is given authority to cause proceedings to be instituted in the name of the United States for the acquirement by condemnation of any land, right of way, or material needed to enable it to prosecute works for the construction and improvement of public highways.

The bill also appropriates \$50,000,000 for carrying out its provisions. The sum of not less than \$500,000 out of such appropriation shall be expended in each State, said sum to be expended in each State at the rate of not less than \$100,000 a year. The \$50,000,000 appropriation is to be available at the rate of \$10,000,000 a year during the years 1908 to 1912, inclusive. The bill also provides for the detail of officers from the engineer corps of the army to assist the proposed commission in carrying out its projects. The bill is to take effect thirty days after its enactment, and if passed would be of benefit to the good roads movement.

MANITOBA FARMERS ASSIST IN ADOPTING A SANE LAW

WINNIPEG, MAN., Feb. 10.—Automobile laws framed by farmers, or by the constitutional representatives of agricultural interests, have so generally been monuments of stupidity, bigotry and narrow-mindedness that the first motor act adopted by the province of Manitoba may be put up as a model for less enlightened districts. The members of the Local House which passed the bill, about 90 per cent. of whom are representatives of, or farmers themselves, are to be congratulated on an act conspicuous for its saneness, broad-mindedness and liberality.

All automobiles must be registered with the municipal commissioner, the initial fee being \$5, and yearly renewals \$2, with a provision for payment of the smaller fee when a car changes hands during the year for which its license has been issued. Numbers must be carried on the front and rear as well as on the front lamps. Chauffeurs or hired drivers must obtain a certificate of registration authorizing them to operate a motor vehicle; before obtaining such they must prove that their eyesight and powers of hearing are in no way defective.

In the open country *no speed limit is imposed*. In central parts of all cities and towns through the Province the limit is 10 miles an hour; in suburban districts the limit is 15

miles and at corners four miles an hour must not be exceeded. At any place when meeting a horse-drawn vehicle the act stipulated that the speed must be cut down to six miles an hour within 300 yards of the vehicle and kept at that speed until the vehicle is passed. When an automobile is overtaking a horse-drawn vehicle the slower conveyance shall give right of way as soon as practicable. A car standing at any place in cities or towns must have its engine stopped in order to prevent accidental starting by mischievous persons.

Road races may be held by permission of any municipal body by a resolution passed in the council giving the necessary authority. Clause 39 in the original bill has been eliminated, as it was thought manifestly unfair to make an owner responsible for damages caused by his car when it was being driven without his knowledge or consent.

The fines for violation of the by-law has been fixed at a sum not exceeding \$25 for the first offense and \$50 for the second or subsequent offense, but it is left to the discretion of the magistrate to inflict a minimum fine where the offense is only of a technical nature. Three convictions will have the effect of cancelling the license for a period of one year or less, at the discretion of the municipal commissioner.

SQUIRE'S CASE WENT TO HIGHER COURT.

PHILADELPHIA, Feb. 10.—On December 27 last Frank P. Young, a local automobilist, voluntarily appeared before Squire Joseph Keen, of Hulmeville, Bucks County, to answer a charge of having failed to "honk-honk" at several street intersections in that borough, as provided by the law of the State. The alleged offense had occurred the previous August, and Young decided to fight the case. Despite a vigorous defense by his counsel, G. Douglas Bartlett, the squire, an inveterate auto-baiter, after his listening perfunctorily to the evidence, imposed the stereotyped penalty—\$10 and costs. In the latter was included the sum of \$1 for serving warrant. As Mr. Young had appeared voluntarily no warrant had been necessary, and lawyer Bartlett hauled the magistrate up for exacting an illegal fee. The old squire was given thirty days to pony up the \$50 damages. The time expired last Monday. Squire Keen, however, carried his case to a higher court, for he died suddenly on Sunday.

ONE VIEW OF AUTO SMOKE ORDINANCES.

"That's about as foolish a move as can be imagined that Mayor McClellan made in New York when he started to secure legislation that will punish automobilists for driving a car out of which smoke will come for a longer period than ten seconds after the car starts," said Designer W. W. Kelley, of the Wayne Automobile Company, of Detroit.

"In the first place, smoke coming from the exhaust pipes is not an evidence of carelessness or incompetence. This smoke in many cars is due to the fact that the crank cases are so shallow that to have sufficient oil in them it must reach a high level. To prevent this smoking would be simply impossible. And in a large number of big cars it would be impossible to prevent smoking at certain times. There's nothing particularly wonderful about a car that does not smoke, and there's nothing particularly bad or obnoxious about a car that does smoke. It seems like splitting hairs to even hint at such a thing as passing a law to prevent it.

ANNUAL REGISTRATION FOR NEW YORK STATE

ALBANY, N. Y., Feb. 10.—Two years ago the automobilists of New York State, through their organization, placed themselves on record as being in favor of an annual registration fee, providing the money was used in the maintenance of the roads already improved.

In the most comprehensive report of the joint committee of the Senate and Assembly, "appointed to investigate the subject of codifying the general and all special highway laws and to provide for a system of highway improvement, their construction and maintenance," there is a paragraph referring to automobiles, and it reads as follows:

Tax on Automobiles.—During our examination of the general subject of highways and their maintenance evidence was presented from almost every section of the State indicating that the use of automobiles upon the improved highways was a source of wear and tear upon the surface which, with their constantly increasing use, would require special attention to be given to this branch of the subject. In wet weather when, for the safety of the automobilist, he is required to use chains upon the slippery pavement of the city or in the mud of the dirt road in the country whenever he strikes an improved highway he does not stop to remove the chains from the driving wheel so that when the improved highway is wet, and, therefore, readily subject to the attack of the links of the chain, its use is injurious to the improved highway; while during dry weather there is a possibility that the road will ravel because while the slow-moving vehicle might slightly disintegrate the surface the automobile, moving at a high rate of speed, produces a suction which removes the dust and finer particles of the wearing surface and thus leads to a raveling of the top course. Already experiments are being made by local officials in various sections of this State, and also in Massachusetts, Connecticut and New Jersey, with reference to the determination of what sort of special treatment may be given to through highways so that they are able to resist this peculiar sort of wearing away of the top surface which comes from the suction produced by the rapidly moving machine.

It is, therefore, clear to your committee that at this session of the Legislature appropriate legislation should be had which will regulate the use of chains upon improved highways and also, inasmuch as there must be special treatment or special construction upon the through highways, it would seem only fair that a reasonable tax should be levied to provide a fund from which this extra burden may be discharged. That legislation should be reasonable as to the amount of the tax, it should be definitely provided that it

is to be spent for the repair to the end that the automobile may bear its just proportion of the burden for any increased wear upon the highway, and, on the other hand, that the payers of the tax may have a guarantee that the money so paid is to be expended for the remedying of the condition which they create.

In considering this question your committee is of the impression that inasmuch as the legislation with reference to motor vehicles is now to be found in a separate law that the proper place for these suggested changes is by amendments to the Motor Vehicle Law. Logically, these provisions of statute should be found in that law rather than in the Highway Code.

At the meeting of the special legislative committee of the New York State Automobile Association, held several weeks ago, it was decided to incorporate an annual fee in the bill which will be introduced in the near future, and therefore the suggestion of a yearly fee in the report of the Joint Highways Committee is acceptable to the autoists, who are also greatly interested in the definite plan suggested for the building and maintenance of the roads and the expenditure of the fifty millions available for the purpose. The chains proposition may be a subject for discussion.

Chairman Jotham P. Allds is a legislator who has been long in harness, reasonable in automobile law-making, and an enthusiast on the subject of roads. Summarized, the report of his committee is reassuring to automobilists who have been discouraged at the slow progress in New York State:

Summary.—The proposed Code provides for a State highway department to be appointed in the month of January, 1909, by the incoming Governor. It provides for either county or district superintendents having charge of small area. It provides a uniform fiscal year with town superintendents to take office practically at the time that the new fiscal year commences. It preserves to the locality the regulation of the incurring of extraordinary expenditures, but it also enforces a more intelligent method of expenditure when the same has been duly authorized and also guarantees to the locality more certainty with reference to the annual repair of improved highways. It divides all highways into three classes—the State, county and town highways. The State highways to be built and maintained by the Department at State expense. The county highways to be selected originally by the several county boards of supervisors, and when approved by the State Department, to be built under the provisions found in this act, which were heretofore found in the Higble-Armstrong Good Roads Act. All other roads to be repaired and maintained by the local authorities under the direction of the Department and under the general superintendence of the county or district superintendent. Said work to be done on the money system and giving to each town the benefit of aid by the State in accordance with the general provisions of what has been commonly known as the Fuller-Plank Law.

AMERICAN AUTOMOBILES SOLD IN 1907 WORTH \$105,000,000

AT both the meeting of the Association of Licensed Automobile Manufacturers and the National Association of Automobile Manufacturers, held February 5 in New York City, the outlook for 1908 was freely discussed. M. J. Budlong, general manager of the Licensed Association, when seen after the meeting, was emphatic in his conclusions that if the general policy of conservatism, coupled with rational business methods and a proper commercial practice were adhered to, the business for 1908 would not only equal but be larger than that of 1907.

Records and statistics for 1907, just completed by the Licensed Association, show to what extent the industry has grown the last year or two. During the fiscal year of January 1, 1907, to January 1, 1908, there were 47,302 pleasure gasoline cars manufactured in this country. The aggregated value is \$96,169,572. During this same period there were 5,000 steam and electric pleasure vehicles built and sold in this country, with a total value of \$7,500,000, this giving a

total of 52,302 pleasure automobiles sold in the past twelve months, with a total value of \$105,669,572.

The percentage of increase each year has been consistent, as shown from statistics gathered in 1904, which show the value of the total output \$26,645,064 as against \$105,669,572 for the past year. It is estimated that the total number of employees directly employed in the factories is 58,000 and the capital employed \$94,200,000.

As in many other manufacturing products, there is an indirect investment which is closely allied to vehicle manufacture. Close estimation shows that there are 29,000 employed in this indirect manufacture, with total capital employed of \$36,700,000. At the close of the year 1907 there were 2,151 sales and garage establishments employing 21,500 people, with a capital of \$57,500,000, employed to do business.

Not including accessories, the total estimation is: Value of product sold, \$105,669,572; total capital employed, \$171,448,769; number of employees involved, 108,500.

COMPANIES PLANNING REORGANIZATION.

HARTFORD, CONN., Feb. 10.—Though nothing definite has been made public as yet, it is understood that the Pope Manufacturing Company and the Electric Vehicle Company of this city will shortly be reorganized on a sound working basis. Where the former is concerned, it is understood that the plans in view contemplate the retirement of Colonel Albert A. Pope, the founder of the business, and the continuance of the Hartford and Westfield, Mass., plants, under the management of A. L. Pope, while the Toledo, Indianapolis and Hagerstown plants will be disposed of. It is said that the profits of the company last year amounted to \$400,000, so that no difficulty is anticipated in reorganizing it.

Though the prospects are good, matters are not so easy with the Electric Vehicle Company. According to a report, it was the intention of William C. Whitney to reorganize the company four years ago, and the plan was about to be carried through when further action was halted by his untimely death. The amount of working capital necessary for the company to resume is said to be \$250,000, and it is anticipated that dividends could readily be paid on a capitalization of from \$2,000,000 to \$3,000,000. One-third of its present stock is held by the Electric Storage Battery Company of Philadelphia, a wealthy concern, while its other principal stockholders are Grant B. Schley, Harry Payne Whitney and Thomas F. Ryan. These stockholders have been carrying a heavy mortgage on the plant and business for several years. It is said that this does not cover the Selden patent, and the prospects of the creditors would appear to be somewhat dependent upon the latter to produce a steady income. During the recent stringency it has been found necessary to permit some of the licensees to defer their payments, and there is also understood to be a demand for a lower percentage of royalty, so that the extent of the income from this source during the remaining four years of the life of the patent is hard to determine.

ROCHESTER TO HAVE ITS FIRST SHOW.

ROCHESTER, N. Y., Feb. 10.—The New Convention Hall, now rapidly nearly completion, will be the scene, on March 18-21, of Rochester's first automobile show, held under the auspices of the Rochester Automobile Club.

SAYS AUTOS ARE REPLACING SLEIGHS.

BUFFALO, Feb. 10.—"The automobile industry is advancing in leaps and bounds in this country now," declared F. A. Babcock, president of the Babcock Electric Carriage Company, at a chance gathering of a number of automobile men at the Hotel Iroquois in Buffalo the other day. "Just think," he continued, "it wasn't more than three or four years ago that when Winter came the owner of an automobile meekly put his car up for the season, gave up all idea of pleasure riding, and had recourse to the train or trolley while attending to his daily business.

"But the case is different now. I venture to say that less than ten per cent. of the auto owners here in Buffalo have put their cars up. The enclosed body is what did it. And then the improvements in wheels and tires and the adoption of the non-skid chain have eliminated the danger that snow used to present to the automobilist. You see the women down in the shopping district every day now coming in their limousine or coupé, and paying no heed to the cold or snow.

"I am not one of those visionaries that think that the automobile means the passing of the horse. But there is one thing that I think the automobile will displace: that is the sleigh. Just recall how few sleighs were out on the avenues and in the parks, even when the going on runners was excellent. The sleighs have to stay in the background now that our automobiles are such that they can be used in Winter as well as in Summer."

REAL ESTATE AGENT'S PROFITABLE AUTOING

NEW HAVEN, CONN., Feb. 10.—A decidedly new stunt in the real estate business has been sprung upon this old university town by C. D. Hall, one of the city's youngest and most progressive real estate men. Mr. Hall's stunt is a Knox automobile, which he employs exclusively in his business. He says that he is able to do about three times the business with the auto he was formerly able to attend to, at a greatly reduced cost. He claims the car quickly saves its initial cost many times over by the vastly increased business. It is stated that several other real estate men are to employ autos in their business and that once the advantages of the new way of showing property becomes known, it will become popular.

HOW FAR-FAMED "JACOB'S LADDER" IN THE SNOW-CLAD BERKSHIRES LOOKED LAST WEEK FROM A 1908 THOMAS FLYER

THE AUTOMOBILE CALENDAR.

BOOKS FOR AUTOMOBILISTS.

Distillation of Alcohol.—With the passing of the act of June 7, 1906, which freed denatured alcohol from the disability it had previously labored under, a new market was opened up for the farmer and manufacturer, and the want was felt for practical information on processes of distillation. F. B. Wright's "Distillation of Alcohol and Denaturing," which did much to meet the want, has just been reprinted, the second edition being a careful revision of the first, with new chapters and considerable amplification on the most modern of methods and appliances in this country and Europe. The design of the author in compiling the second volume has been to follow the original plan of writing a plain, practical handbook on the manufacture of alcohol and denaturing for industrial purposes, the work being intended not as a scientific treatise, but as a help to farmers and others wishing to go into this industry on a moderate scale. That object has been fully attained, the subject being handled comprehensively, clearly, and made additionally valuable by numerous drawings. The book is published by Spon & Chamberlain, 123 Liberty street, New York.

A Handbook on Automobile Repairs.—Automobilists who aim at being so completely master of their car that they will be independent of the repairman except for serious breakdowns, will find considerable educational value in "Practical Motor Car Repairing," an illustrated handbook published by Percival Marshall & Co., of London, and sold in New York by Spon & Chamberlain, of Liberty street. The work, which is compiled more with a view of meeting the wants of the amateur than the professional repairman, deals with the commoner weaknesses and defects of an automobile and tells in a simple manner how they may be remedied.

"WINDY BILL" WILL CHAMPION THE MULES.

Editor THE AUTOMOBILE:

You will find clipping from the Louisville Evening "Times" which I thought might be of interest to your readers. However, do not think there is any danger of any sane body of men passing such a law, and even if they should, I give the Governor of this State the credit of having too much common sense to allow it to become a law. Would suggest that "Windy Bill" go back to his lop-eared mules, where I am sure he can get lessons in common mule sense he seems to be sorely in need of.

J. H. BOVARD.

Newcastle, Ky.

FRANKFORT, KY., Jan. 14.—Automobiles will have to remain in the woodshed if a bill which is to be introduced by W. M. Thompson becomes a law. Mr. Thompson, who is known as "Windy Bill," and who has a voice, when it is in condition, that reflects great credit on its owner, says that so many autos have been running over the State, and especially his county, that they have become a menace to the lives of the people and he would put them in the class with traction engines.

The bill which is being framed by Mr. Thompson is a lively one. It will provide that a man must go ahead of each automobile and keep one hundred yards in advance of it, on foot, all the time so as to warn persons along the route that the engine is coming. The machines will not be allowed to travel at a rate of speed greater than three miles an hour, and no more touring parties will be permitted.

Mr. Thompson thinks that he can get the bill through the two houses and will make a speech in support of it, in which he will touch on the "dreadful horrors of the automobile and the immense damage it does to the nerves of mules and persons driving the mules." Mr. Thompson represents Bullitt and Spencer counties.

ANENT THE WOES OF THE GARAGEMAN.

"We certainly do have troubles of our own," wearily assented the garage keeper to the sympathetic feeler ventured by the reporter in search of a story. "Between a lot of old ladies who have nothing to do but spend their money, and who can't understand why a week's work on a car should cost more than the price of a Paris outfit, and the people who can't afford to keep a car anyway, the pot is kept boiling for us pretty steadily, and we are seldom out of hot water. I'll tell you how it is—here's another of 'em now. Come around some other time and I'll fix you up."

AUTOMOBILE LAWS OF TWO STATES:

Connecticut and New Jersey represent the opposite points of the compass in automobile legislation: one State accepts the motor-driven vehicle as a pleasurable and commercial necessity; the other commonwealth grudgingly gives it place in the general scheme of transportation. In several respects the conditions brought about by the coming of the automobile are analogous in both States.

Connecticut intervenes between New York and Massachusetts, and in consequence its excellent roads are traveled by the thousands of automobiles which yearly repeat the journey having New York City and Boston as destination points. New Jersey likewise supplies much frequented trunk roads used by automobiles circulating between New York City and Philadelphia.

Connecticut possesses summer resorts in plenty; New Jersey's coast has numerous part-year colonies and the largest hotel population of any State in the country.

Both States have been progressive in the building of roads, and it is natural that they should be vitally concerned as to the mileage exacted from these highways by the vastly increased traffic, for keep in mind that a hundred vehicles will wear out a road much more quickly than one-tenth of that number.

And thus are the laws of the two States different:

Connecticut welcomes the visitor if he be registered in his home State; New Jersey calls for the fee as soon as he quits the ferryboat.

Connecticut has erased all speed technicalities below twenty-five miles an hour, except to ask fairly that at all times the operator shall not drive to the danger of other users of the road; New Jersey reiterates insistence of the "eight miles per hour," etc., despite the fact that every vehicle which moves violates this provision, the real value of which, however, is based on the lucrative operation of "traps" in places where traffic is meager.

Connecticut does not find it essential to require of its home or visiting autoists any power-of-attorney clause to insure the punishment of offenders, and the working of the new law has not caused any proposal looking forward to an adoption of this most objectionable feature of the New Jersey law, which has kept many an automobile owner out of that State.

When one takes note of the fact that Connecticut's husbandry is a most powerful factor in the legislature because in that State its law-making body is constructed on the old plan whereby every township has two representatives no matter what its rank in population, there must come a realization of the liberal and common-sense spirit of its farmers, whose antagonism to automobiles subsided as soon as their horses became accustomed to the new user of the road. Then, this wideawake commonwealth has a highways commissioner by the name of McDonald, who, along with the agriculturists, recognizes without quibbling that the automobile is here to stay and that if the present road does not meet the demands of the more trying traffic there must be a solution of this new problem in roads building.

It may pay the State of New Jersey to retain its rigid requirements, repelling and not inviting the automobilists from other States, but any method of bookkeeping which it can employ to show a profit is not finding acceptance elsewhere, and even in its own boundaries there will be found not a few dissenters. What the State unsuccessfully asks from visitors in registration fees is lost many fold to its merchants.

It is praiseworthy for the Governor to express himself in favor of a tire tax to cover all vehicles and further stipulate that they shall carry lights at night, but from the standpoint of commerce, if for no other reason, the chief executive will serve better his State if he assists in bringing about reciprocity in registration, abolishment of traps by doing away with the farcical "miles per hour" in its lesser speeds, and eradicating the power-of-attorney clause.

New Jersey may consider that it can afford to place itself in the same position as the single jurymen who explained the failure to reach a decision by saying that he had "never before met eleven such obstinate men." While to some the words of Hotchkiss and Terry at the banquet of New Jersey's largest club may have sounded scathing and unpleasant, many will admit that the indictment was based in fact, even though their Governor took the floor a second time to defend a law in the making of which he had had no part.

But it is pretty good figuring that many when planning their runs the coming season will wend their way Connecticutward instead of entering a State which believes in uniform laws only when other States accept its statutes.

NEW JERSEY CLUB'S BANQUET HONORED BY A GOVERNOR

NEWARK, N. J., Feb. 10.—Automobilists of this State are still discussing the banquet last Thursday night of the New Jersey Automobile and Motor Club, held at Achtel-Stetter's and attended by over two hundred members and honored by the presence of Governor Fort, who is looking into the automobile question with considerable care. The present so-called Frelinghuysen law has been less acceptable to outside autoists through reason of the power-of-attorney and non-reciprocal registration clauses than to home owners, who have made the best of the situation and fared fairly well through the reasonable interpretations of Commissioner of Motor Vehicles Smith. Therefore, the drastic criticism of the State law made by William H. Hotchkiss, president of the American Automobile Association, and the plea for a uniform statute presented by Charles Thaddeus Terry, chairman of the national body's Legislative Board, while listened to with marked attention, did not arouse that unanimous approval which would have been unquestionably the case had the listeners consisted of non-residents.

Though Governor Fort had previously contributed an opening talk which was greeted with pronounced favor, especially his references to a tire tax for all vehicles and a law calling for the carrying of lights at night, he resented the remarks of the speakers following him, and while he had had nothing to do with the framing of the existing law, the chief executive arose to its defense and made it clear that he did not agree with the plain language of President Hotchkiss or the incisive suggestions of Chairman Terry. It was a situation in which a governor considered that his State had been attacked, and, of course, he retorted.

As to whether Governor Fort will retain, after closer observation, his expressed belief in the criticised features of the law is a matter for the future to determine. There is well-grounded belief that even Senator Frelinghuysen does not now consider the law with which he had so much to do with the making entirely up to date, and if the clubs of the Associated Automobile Clubs of New Jersey can bring about the proposed conference with that astute statesman there is hope that an understanding may be reached which at least will mitigate some of the provisions now so bitterly complained of.

President Hotchkiss is a man of strong convictions, as the following extracts from his speech, entitled "Jersey Justice," make evident:

Jersey Justice! The rogue, 'tis said, here has short shrift, the punishment always fits the crime, wrong is done no man, and common sense is law. And you sum it all up in the phrase: "Jersey justice."

Still, somehow, a New Yorker and a motorist may be excused the question—and in all seriousness—what's wrong with Jersey Justice when applied to motor users, particularly those from other States? Your people are not unlike ours, many of you pass the days in our metropolises; your streets, your municipal services, your buildings, your general laws are much the same; and, to-night, this Lucullian board and this your generous hospitality—why, even New Yorkers could do no better, perhaps, not so well. More, as I stepped from the ferry and walked to the train to-day, I was not halted and asked whether I had registered and been tagged from Trenton, though the officer on guard must have guessed that I would, ere long, help wear out your sidewalks, be guided by the radiance of your street lights, and enjoy the protection of your police. And yet, I was not stopped and numbered! Nor has any peace officer yet demanded that I execute a power of attorney to some unknown official over on the Delaware through whom New Jersey could retain jurisdiction of my body and property in case I might heedlessly violate your laws or accidentally invade the rights of Jersey men. So for me, to-night, it's: Hoch to Jersey Justice! For, gentlemen, let it be recorded that, on this day of grace, the sixth of February, nineteen hundred and eight, a New Yorker and a motorist boarded a ferry boat, with deliberate intent to use your streets and sidewalks and purloin from you, for the time, all those public services which make modern life so easy, and that, after using them as freely as the air he breathed, he is

here in Newark to-night, unlicensed, untagged, unattorneyed—and still at large. You know the reason. Like tens of thousands more, in settling out for New Jersey, he left his automobile at home.

And so I again ask: What's the matter with New Jersey in dealing with the motor car? Prejudice has existed in New York, rustic Dobbins still sometimes shy at the newfangled wagons, drastic ordinances have been passed, and weird laws enacted, and at times enforced. Yet, for nearly four years, our motor vehicle law has proved so acceptable as not to require amendment—framed by motorists it was passed unanimously by a Legislature dominated by the farmer vote—strangers are free to use our roads, without registration or tax; motor vehicle licenses, with us, are unheard of; accidents, save in congested territories, relatively rare; speed traps, except on the borders of the Greater City, all but unknown; and the time seems rapidly approaching when the present automobile law of New York will be as dead a letter as is the bicycle law.

Not so in New Jersey. You enforce literally the miles-per-hour speed clause. Result: A good friend of mine, accustomed to the sane Buffalo rule, which commands rather a due observance of the conditions of the highway and the traffic thereon at the time, made seven contributions to Jersey justices in one day last summer, for real or speed-trapping violations of law, and vows heretofore to keep himself and his purse beyond your borders. You use the excuse of necessary identification to tax all outlanders, and thousands voice their protests by spending their money elsewhere. But, most unreasonable of all, by the power-of-attorney requirement, you refuse the right which, for nearly fifteen centuries, the average man has had to a trial in civil suits, by a jury, not merely of his peers, but of his neighbors. And, when they learn of cases where heavy default judgments have thus been obtained, because of unknown and sometimes imagined injuries, thousands more will resent this cruel and unusual requirement—I had almost said punishment—and hie themselves, their cars, and their cash to more reasonable and more hospitable States.

Co-operation Among Motorists Necessary.

What's the matter with New Jersey?

First, there has not been that co-operation among motorists themselves, by which alone unreasonable laws may be prevented; you have not made the proper regulation of the motor vehicle your business, each winter, in the Legislature, each month of the year, in assisting the proper enforcement of the ordinary rules of the road. But, this is not the place to chide; and you are, I'm told, now cementing an organization for these purposes.

Second, there are reasons far more potent. In New Jersey, the prejudice of the horse and his owner—that of the horse the stronger of the two—have not, as elsewhere, materially decreased; while the desire for revenue from outlanders seems, of late, to have become a settled State policy. Thus, responsive to prejudice and self, your legislators have—may I say it?—become yearly more blind to the first principles controlling on the use of the roads. Some of these principles—trite, axiomatic, old-fashioned—I have already suggested. Let me emphasize them. For in the words of wise men, while "multitudes are ruled by prejudices," "principles, like troops of the line, are undisturbed and stand fast."

The Camel and the Cart Ages.

When the two-wheeled cart first began to share with beasts of burden the wayward roads of prehistoric times, the camel age in transportation came to an end; the vehicle age clumsily began. The cart outstripped the camel; it needed more room. If we could but read the history of those times, the camel drivers were vociferous and vitriolic in their attitude toward the new invention, and, for a time, the carts were forced to lumber slowly over narrow and uneven paths. The years rolled on, the carts increased in number, the camels grew less, until, in the crowded ways of ancient days, the caravan gave place to a train of sturdy chariots; and the vehicle age, as we know it, had really begun. Now, I wonder how long did those ancients submit to the plight of the camel man that he was frightened and crowded, and outstripped; how long did the chariot man submit to a rule of the road limiting him to camel speed? Doubtless, just so long as he could not help himself.

The Motor Vehicle Age.

So of us. We live in the beginning of the motor-vehicle age. The day is dawning when the prehistoric beast of burden and the ancient cart will both all but vanish from the public roads. A mighty revolution in individual transportation is under way.

'Tis the camel-cart controversy over again. Like the camels, the carts are still much in the majority; there is clamor and complaint from their drivers; as of old, the roads are not altogether suited to new conditions; but, in the field of transportation, civilization has moved forward another notch, and there's no turning it back.

More in point, in this new era, these changed conditions, which is more sensible, more just, the enforcement of old customs or the adoption of new rules? Clearly, the latter. For a time, perhaps, the unrestrained use of the full powers of the new vehicle should be checked by positive law. This granted, as to speed at least, what should that law be? Unless I am much in error, a rational application of the simple maxim that, in the use of the public ways, the individual must so conduct himself as not to infringe the rights or endanger the life, limb or property of another.

Very true, admits the motor-phobe, but such a doctrine concedes the justice of present laws; your new vehicle constantly endangers the lives and property of others. I reply, does it do so on an open country road, visible for miles, without either a crossroad, another vehicle, an animal or a human being in sight? Does it even in the business streets of a great city, say, at dawn or at midnight? No; "miles-per-hour" is a statutory speed trap, where prejudice starts the stop-watch at one end, and legalized plunder bars the way at the other. The true principle, and, in road regulation, it is as old as the camel or the cart, is that unlawful speed should be determined, not arbitrarily by miles-per-hour, but, by the condition of the highway, and the traffic thereon at the time, that is, whether in the judgment of men the rate is such as then and there to endanger the lives or property of others.

Violations Fewer; Punishments Easier.

But, says the twentieth-century camel man, you would make it impossible to catch and punish. Not so. It would be easier far; that is, if all you want is to bring to book those who actually endanger the life, limb or property of another. The stop-watch would cease its wrangle with the speedometer; and the proof would be that of the ear and the eye of the spectator and of the principals. It would be easier to prosecute, not, as now, to persecute—surely, Mr. Modern Camelman, you wouldn't stand for that!—and not the least element making for conviction would be the general recognition of the justice of the rule, by the new charioteers.

And so I repeat, New Jersey has been blind to first principles, in enacting and enforcing a miles-per-hour rule. Connecticut was first to adopt the real rule. New York seems likely to do the same, this year. Why not New Jersey, too?

Whose Are the Public Roads?

Again, in this age of progress and enlightenment, whose are the public roads? The farmer's whose lands they abut, the town's in which they are, the commonwealth's through which they pass, or yours and mine, citizens of this nation of independent but indestructible States? In their beginnings, they were, perhaps, but cow-paths; in some cases, mere rights of way; in many instances, they are still imperfectly maintained by neighborhood labor; yet, in our modern civilization, they are and hereafter always must be the people's roads, free to all who come and go, whatever be their race, condition, or dwelling place.

If so, and the time has come—as it has—when the State must build and maintain them, it follows that they should be paid for by the State, and not by a part of the State, much less by any class of citizens of the State. Each of these principles is already violated all over the country; and, in the chaos of inequity in which our American tax laws have become involved, the injustice of the thing should, perhaps, for a time, be silently endured. Yet New Jersey, in enacting a registration toll from non-residents, and excusing it on the plea of road maintenance, stands almost alone.

Roads Should Fit the Traffic, Not the Traffic Fit the Roads.

But, says the road expert, your new vehicles destroy our fine roads. Perhaps; but, in an advancing civilization, roads should be made to fit the traffic, not the traffic to fit the roads. The Romans were the greatest of road builders. Little need had they for a wider surface or deeper foundation than would resist the progress of the legions and their camp equipment; yet, vast siege engines must also be transported, and so those roads were laid so deep that fifteen centuries of neglect have left them practically untouched. The great road builders of the new world, the Incas of Peru, to whom horses were unknown, found narrow ways, steps cut from mountain sides, and airy swinging bridges sufficient for their post runners; and a mighty, durable and substantial road system was that of barbaric Peru. But, the Spaniards came, with their horses and carts and, too shiftless to change the Inca roads to fit the traffic of a higher civilization, the highways, which once had done the work of a simpler people, went to ruin and decay. In all times and among all peoples, the strength of a public road, its success as a means of intercommunication, has depended—nay, must always depend—on its resistance to the wear, not of the foot passer, but of the harshest vehicle commonly used by its public. No; if these new macadam roads of ours are behind the times, in this, the motor vehicle age, they—not the times—must be changed; and, in changing them, right and justice suggest that the whole people, not a few, bear equally the burden.

Non-resident Road Taxation Indefensible.

But, again rejoin your road officials: You New Yorkers use our

roads; why shouldn't you help pay their up-keep? I might reply: You, New Jersey people, use our roads, and we haven't, save as reprisals, ever thought of asking you to contribute to their care. The real answer is again found in a resort to first principles. The fathers tried out the experiment of the loose Confederation, and quickly gave it up. By the Constitution, imposts and taxes between the States were prohibited, the regulation of commerce, intercourse and travel between them assumed by the central government, and the doctrine of commercial hospitality established as a principle of our land. There are no Chinese walls in our nation of States; no treaty ports need ever be established. This principle, one of wisdom, in that it makes for free trade between all of the States, and of comity, in that it establishes a neighborly hospitality nation-wide, is violated by New Jersey; and New Jersey suffers because of it. Thousands of motorists now shun your State, and your hotels, and your tradesmen are a million poorer each year.

\$10,000 of Tax or \$1,000,000 of Trade.

What's the matter with New Jersey?

Her legislators and her people are blind, not merely to interstate comity, but, for a few dollars of tax, annually sacrifice an hundred-fold more in trade, which now goes to States without walls. How far the principle of free travel should yield in cases where the outlander abuses his privilege by becoming an all-year or even a summer resident is an open question. But, to the mere tourist, the roads of New Jersey, like the sidewalks and pavements of Newark, should be as free as the New Jersey air.

Power-of-Attorney Clause Unwarranted, Un-American.

One more point, and I am done. Boston's protest against the tax on tea was the first drumbeat in a great struggle for liberty. I wonder how those sturdy Boston patriots would have borne a regulation of the English board of trade that, as a condition to trading in England, the colonial merchant must designate such board as his attorney to accept service in case of default or disagreement, and thus submit his rights to a hostile British jury, instead of one made up of his peers at home. Such a rule would have violated a principle more ancient than the doctrines for which Cromwell fought and Sam Adams thundered. Says Gibbon, speaking of the Salic law, which dates from the time of Clovis: "In all causes where the parties were of different nations, the plaintiff or accuser was obliged to follow the tribunal of the defendant." Such, in civil matters, at least, is the law of our land to-day. And yet, New Jersey, alone of all the States, says: Not so! On what theory? Are we motorists, in civil cases, criminals, too, whom, since under general law you cannot extradite, you would unrighteously force into the tribunal of the plaintiff? Or, are we merely undesirable citizens, against whom the power-of-attorney clause is intended as a bar? No, gentlemen; there are a few drops of New England blood still left in thousands of motoring men, who, if they but knew of this requirement, would not cross your borders in an automobile so long as that unwarranted and un-American provision is on your books.

Present Law Against Principle, Courtesy and Self-Interest.

What's the matter with Jersey justice? Blind, as justice should be! But, in dealing with the automobile, blind to the principles which should control the use of the public ways; blind, stone blind to that comitas gentium, or, in modern phrase, interstate courtesy, which our American citizenship expects and usually enjoys; blind—may I say it?—Chinese blind, to the interests, the pocket-books of her own people, in that, even in the year nineteen hundred and eight, the wall is still up and traffic and travel halted at her gates.

Men of New Jersey, forget what I have said that may seem harsh. Think only of the cause I represent.

Men of New Jersey, outside the wall we of other States extend the hand of good fellowship and bid you welcome everywhere.

See, the time has come. Won't you help throw down that wall?

The concluding speaker was Commissioner Smith, who told of the results secured by the present law, which he contended had been very satisfactory. An increase in the number of inspectors, he thought, would be of great worth.

President Angus Sinclair presided, and before introducing the first speaker, briefly reviewed the history of the club, told of its rapid growth, referred to its membership of nearly eight hundred, and paid a well-deserved compliment to H. A. Bonnell, the hard-working and conscientious secretary, who in the past year has done so much to further the prestige of the organization. Besides the orators on the occasion there were at the guests' table L. R. Speare, ex-president of the Bay State Automobile Association of Boston, and S. L. Haynes, ex-president of the Automobile Club of Springfield, Mass. Chairman Joseph H. Wood of the banquet committee had his troubles in providing for the large number of diners, not a few of whom were of the eleventh-hour variety.

DIRECTORATE OF THE A. A. A. FOR THE YEAR IS ANNOUNCED

TWENTY-SIX States are represented on the board of directors of the American Automobile Association, and there are also spokesmen from the District of Columbia and the Hawaiian Islands. Before the end of the year it is expected that every State in the country will be represented on the governing board of the national automobile organization. Where a State association exists, that body selects the directors to the national board, and in States not yet organized, clubs belong direct to the A. A. A. and are given direct representation. Following is the list of directors:

MASSACHUSETTS. Elliott C. Lee, Lewis R. Speare, S. L. Haynes, W. H. Chase, John P. Coghlin.	IOWA. W. D. Petersen.	VIRGINIA. H. L. Myers.
RHODE ISLAND. Elliott Flint.	KENTUCKY. George H. Wilson.	MISSOURI. Roy F. Britton, Harry M. Rubey.
VERMONT. W. H. Riddle.	NEW JERSEY. Joseph H. Wood, G. E. Farrington, George A. Post, J. H. Edwards, K. G. Roebbing, W. T. White.	LOUISIANA. Albert Mackie.
CONNECTICUT. W. F. Fuller.	PENNSYLVANIA. Isaac Starr, R. P. Hooper, Paul C. Wolff, Edward Kneeland, F. A. Godcharles, Peter A. Meixell, J. H. Weeks.	TEXAS. E. H. R. Greene, H. T. D. Wilson, H. S. Crawford.
NEW YORK. Oliver A. Quayle, William H. Hotchkiss, Jefferson deM. Thompson, W. K. Vanderbilt, Jr., C. J. Edwards, F. B. Hower, Charles T. Terry, A. G. Batchelder, G. H. Stillwell, F. H. Elliott, H. S. Woodworth, C. H. Benedict, S. M. Butler, C. D. Hakes, Otis W. Sherman, A. R. Pardington.	DELAWARE. John Bancroft.	WEST VIRGINIA. W. E. Minghini.
	MARYLAND. Osborne I. Yellott, H. M. Rowe.	GEORGIA. F. C. Battey, H. J. Lamar, Jr.
	DIST. OF COLUMBIA. Horace C. Chandlee.	FLORIDA. Asa Paine.
		OHIO. F. T. Sholes, Windsor T. White, Val Duttonhofer, Jr.
		MICHIGAN. Edwin S. George, D. Emmett Welsh.

INDIANA. H. O. Smith, J. A. Speckenhler.	Charles P. Root, Sidney S. Gorham.	Oliver Crosby.
ILLINOIS. L. E. Myers, Ira M. Cobe, N. H. Van Sicklen,	WISCONSIN. James T. Drought.	COLORADO. F. L. Bartlett.
	MINNESOTA. Frank M. Joyce, Neal Brown.	CALIFORNIA. Milbank Johnson.
		HAWAII. G. P. Dennison.

The next meeting of the board of directors will be held at the association's headquarters Tuesday, March 3. Thereafter meetings of the board of directors and its executive committee will, so far as possible, be set for other cities, thus giving directors living at a distance from New York an opportunity to attend some of the meetings.

Racing Board Appointments Announced.

The A. A. A. Racing Board, the appointment of which is just announced, is constructed on somewhat different lines than in previous years, the automobile manufacturing associations being given representation. It is considered that the time has come when racing matters should be directed, not entirely by amateur sportsmen appointed from the various clubs of the country, but also by manufacturers, and that with both elements represented on the racing board, much can be more effectively accomplished than heretofore. Following is the list:

Jefferson deMont Thompson, chairman, 26 W. 27th street, New York. Frank G. Webb, vice-chairman, 105 Garfield place, Brooklyn, N. Y. Frederick H. Elliott, secretary, 437 Fifth avenue, New York. William K. Vanderbilt, Jr., A. B. Lambert, Asa Paine, Thomas Henderson, A. G. Batchelder, Benjamin Briscoe, Jr., Lewis R. Speare, S. A. Miles, H. A. Bonnell, Alfred Reeves, Charles J. Swain, Percy Owen, Harry W. Knights, J. J. Mann, C. G. Greenburg, A. L. Riker, S. L. Haynes, Roslter Worthington, E. R. Thomas, S. M. Butler, H. H. Knowles, Henry Ford.

GOVERNOR TO ATTEND A. C. OF GERMANTOWN BANQUET

PHILADELPHIA, Feb. 12.—Governor Stuart is to be the star figure at the annual banquet of the Automobile Club of Germantown, to take place Saturday evening next at the organization's model clubhouse in Carpenter street, Germantown. Besides the governor, the notables will include Mayor Rayburn, Congressman Reuben O. Moon, Hon. Samuel P. Rotan, of Philadelphia; Charles W. Bosworth, of Springfield, Mass., and O. S. Henninger, of Allentown, Pa.

In view of the fact that the American Automobile Association secures the chairman of its Good Roads Board from

the Automobile Club of Germantown, in the person of Robert P. Hooper, the guests will include several prominent in the national organization: Isaac Starr, president of the Pennsylvania Motor Federation; A. N. Chandler, president of the Automobile Club of Philadelphia; Charles Thaddeus Terry, chairman of the A. A. A. Legislative Board; Frederick H. Elliott, secretary of the A. A. A.; and A. G. Batchelder, chairman of the Publications Board. It is anticipated that the affair will be the most successful in the history of the club, and the main banquet hall will be filled to overflowing.

TAXING THE AUTOIST TO KEEP JERSEY ROADS IN REPAIR

ONE of the most influential newspapers in the entire country is the *New York Times*. Once, before its owner became an autoist and personally acquainted with the experiences of other autoists, there were occasional editorials in that daily which failed to find much approval from those interested in the motor-driven vehicle. But the *Times* saw the handwriting on the wall, as is evident from the following editorial, entitled "Taxation Has Its Perils":

Gov. Fort of New Jersey, it is reported, thinks that automobilists should be made to pay enough in the shape of licensing fees to keep in good order the main roads of the State, and, with that pious end in view, he is having prepared for submission to the Legislature laws which will much increase the special burdens of the motor car folk, particularly those from other States.

It seems to us that Gov. Fort would do well to go rather slowly in this direction and to think things over several times before he goes far. Of course, the automobilists ought to contribute for the up-keep of roads. Nobody doubts, nowadays, that the machines

inflict no little wear on highway surfaces as at present constructed, distributing the same in the shape of dust over the circumjacent landscape, but while it is right for the automobilists to pay their way, it is not obviously just to impose on them anything like the entire cost of maintaining the roads they use, and to do so might easily be the reverse of good economics.

The automobilists, Gov. Fort and other Jersey men should remember, have a habit of spending money as they move along over the earth's surface—of spending it at frequent intervals and in quantities highly satisfactory, at least to the recipients. And the recipients are many. Not only innkeepers and the owners of repair shops and garages profit by the opportunity to satisfy the ever-recurring needs of these travelers, but almost everybody else, in one way or another, directly or indirectly, comes in for a share from these expenditures.

A certain amount of taxation this form of traffic will bear without effective resentment, and that amount, or something close to it, can safely be imposed, but to exceed it is to decrease, not increase, the revenue, for the effect will be to make the automobilists seek other scenes, where, if they are not better loved, they are at any rate better appreciated.

WINTER ACTIVITIES OF THE AUTO CLUBS

RULES FOR BAY STATE FEBRUARY 22 RUN.

BOSTON, Feb. 10.—Rules to govern the 150 miles endurance run that is to be conducted by the Bay State Automobile Association on Washington's Birthday, February 22, have been issued by the committee in charge. In making up the rules the committee has had before it the rules which gave much satisfaction in the Boston to Keene, N. H., endurance run last summer, and also the rules of contests elsewhere, such as the Chicago and Quaker City runs, and it has evolved a set of regulations which it claims are the most concise and complete of any yet used in such an event. There will be a contest committee having charge of the cars while on the road, and also a technical committee which will make the examination of the machines at the end of the run. The two committees, however, will work independently, and it is not intended to permit complications to arise by making the findings of the technical committee subject to review by the contest committee.

The run will start at the Bay State Association's clubhouse on Dartmouth street, Boston, at 7 o'clock on the morning of the holiday, and controls and time schedules will be established throughout the route. The first leg of the run will be to Providence, where there may be a short stop for luncheon. The second leg will be from Providence to Worcester, where there will be another short stop, and the final leg will be from Worcester to Boston. The roads selected are the best available, being mostly State highways of macadam construction, which are usually in good condition no matter what the weather may be. The time schedule will be within the State law and local ordinances and special rules have been made to prevent racing between controls.

There are to be two classes: Class A for touring cars and four-seated tourabouts, and Class B for two or three-seated runabouts. A silver trophy will be awarded the winning car. In case of tie the committee may require that the contest be continued, or certificates will be awarded to the winning cars. All cars must be of stock patterns and carry regular equipment. Observers are to be carried, and in addition there will be checkers at the various controls. The penalties will be two points a minute for adjustments, repairs and replacements, one point a minute for being late at controls, two points a minute for being early at controls and five points for not keeping the engine going except at certain specified points. Entries will close with Alfred N. Robbins, secretary of the committee, 53 Stanhope street, Boston, at 6 P. M., Wednesday, February 19. The committee in charge consists of J. C. Kerrison, Ernest A. Gilmore, Horace G. Kemp and Alfred N. Robbins.

AUTOISTS DINE ROAD SUPERVISORS.

NEWCASTLE, PA., Feb. 10.—The newly formed Automobile Club of Lawrence County entertained the county supervisors at luncheon at Fountain Inn, February 5, the occasion being the meeting of the supervisors to formulate plans for the betterment of the country roads. The meeting was addressed by State Highway Commissioner Joseph W. Hunter and others prominent in road improvement circles. So far there has been about twelve miles of macadam road constructed under the new Pennsylvania law, but owing to the top layer being half clay the roads already need repairs costing \$400 to \$700 per mile. All the supervisors are in favor of a fourteen to eighteen-foot roadway of vitrified brick, as the first cost is but little more than macadam, and the repairs would be practically nothing, while such a road would also be practically free from the nuisance of dust and mud.

QUAKER CITY CLUB ELECTS NEW OFFICERS.

PHILADELPHIA, Feb. 10.—The principal business transacted at the annual meeting of the Quaker City Motor Club at the Hotel Majestic, last Thursday night, was the election of officers to serve during the ensuing year. The only contests were for secretary and the board of governors. The election resulted as follows: President, P. Donald Folwell; first vice-president, A. T. James; second vice-president, L. D. Berger; treasurer, A. T. Stewart; secretary, Harry C. Harback; the foregoing and Charles J. Swain, G. Douglass Bartlett, Frank Hardart, E. H. Lewis, Richard Sellers, Dr. J. R. Overpeck, G. Hilton Gantert, M. E. Brigham, and W. J. Donnelly constituting the new board of governors.

Previous to the election the prizes won in the club's New Year's endurance run were presented—Class A to George H. Smith (White); Class B to J. D. Dorrance (Packard); Class C to W. M. David (Maxwell); and Class D to Daniel Webster (Frayer-Miller). The winning drivers in Classes A, B and C were awarded solid gold watch fobs designed after the club's emblem. Certificates of merit were also awarded the three clean-score Class A cars in the original run on January 1-2 of the present year.

A banquet followed, during which many prominent officials of the club responded to impromptu toasts. Ex-President Swain sounded the keynote of the club's policy when he urged a continuance of the past activity in the promotion of road competitions of various kinds. In his opinion such events have a marked beneficial effect in sustaining interest in the club and its work. One of his suggestions—the amendment of the by-laws to include a Technical Committee in the official list to be named annually by the president—was well received, and may be acted upon later.

The first official act of President Folwell after his induction was the naming of Richard Sellers, a member of the board of governors and a prominent local engineer, as chairman of the contest committee. This selection insures another active year for the club. The preliminary outline for the coming campaign, which will include Spring and Fall race meets, a hill climb, the New Year's endurance run, and other events, was discussed by Mr. Sellers, although he has not as yet decided upon the personnel of his committee.

"LAND'S END TO LAND'S END" ECONOMY RUN.

BROOKLYN, N. Y., Feb. 10.—Entry blanks for the first annual midwinter Land's End to Land's End economy test, to occur Tuesday, February 25, under the auspices of the Long Island Automobile Club, have been issued. The course is from the clubhouse at 360 Cumberland street, Brooklyn, to Montauk Point and return, a distance of 242 miles in one day. Under the conditions named by the contest committee, the route to Babylon is elective. From Babylon to Montauk Point cars will follow the Merrick or South Country Road to Patchogue. From Patchogue the route leads to Southampton and from there to the lighthouse at Montauk Point.

On the outward trip there will be four checking stations, the first at the Sherman House, Babylon; the second at Roe's Hotel, Patchogue; the third at the Irving House, Southampton, and the fourth at the lighthouse at Montauk Point. The route for the return trip is elective and there will be no checking done except at the finish at the clubhouse.

The start will be made at the clubhouse at 6 A. M. No cars will be checked in at night before 9 o'clock P. M. and none after 12 o'clock midnight. First prize in the hard contest, valued at \$200, will go to the car which carries its full quota of passengers the entire distance at the least per capita cost.

N. A. A. M. FIXES EXACT DATES FOR CHICAGO SHOW

FEBRUARY 6 to 13, inclusive, has been fixed upon as the exact time of the next Chicago show, to be held in the Coliseum and First Regiment Armory, this decision being arrived at at a meeting of the executive committee of the National Association of Automobile Manufacturers held in the New York offices, February 5. The question of a commercial vehicle department remained undecided, but it was resolved to make some changes in the rules covering allotments in order that the distribution of space may, if possible, be more equitable. No definite action on this will be taken for some time, however.

It was decided to organize a traffic department, of which J. S. Marvin, until now associated with a similar branch of the Association of Licensed Automobile Manufacturers, will in all probability be in charge. F. H. Hart, representing the Corbin Motor Vehicle Corporation, was elected to membership, and Messrs. H. O. Smith, of the Premier Manufacturing Company, and Angus Smith, of the Olds Motor Works, were elected members of the executive committee, replacing G. W. Bennett, who formerly represented the Knox Company, and M. L. Goss, deceased.

In connection with the informal discussion on the outlook, Manager S. A. Miles declared: "My personal opinion is that the recent difficulties will prove to have been a godsend to the industry. There can be no doubt that we were on the eve of a tremendous over-production, which has been headed off—first, by the determination of wise makers to curtail

production, and second, by the inability of the unwise ones and the experimenters to procure the necessary capital to enable them to flood the market. It is not unlikely, I should say, that even the most radical men must become convinced of the folly of producing cars without some reasonable certainty that they will sell; in other words, that practically all makers will, in the future, be reasonably sure of their market before they incur the expense of manufacture."

Brock Resigns Position with Licensed Body.

At the meeting of the executive committee of the Association of Licensed Manufacturers held the same day in their offices, on East Forty-second street, the resignation of Marcus L. Brock as associate manager was received and accepted with regret. In consequence of this resignation the transfer of the traffic department to the N. A. A. M., and other changes, there will be some rearrangement in the staff of the licensed body, as a result of which it is understood that H. T. Clinton will look after the agency interests and to some extent the traffic affairs, as well as have charge of the advertising department. M. J. Budlong, the general manager, will take over most of the duties which fell to Mr. Brock.

Among those who attended either one or both of the meetings were Charles Clifton (Pierce), Thomas Henderson (Winton), S. T. Davis (Locomobile), W. E. Metzger (Cadillac), Herbert Lloyd (Columbia), F. L. Smith (Oldsmobile) and L. H. Kittredge (Peerless).

'FRISCO TO HAVE A SHOW, WOMAN'S CLUB ASSISTING

SAN FRANCISCO, Feb. 8.—The automobile enthusiasts of this city are not going to allow 1908 to pass without holding an automobile show. Unlike last year, it will not be given by the Dealers' Association, but has been started by those of the dealers who voted in minority when it was decided not to hold a show this year. The dealers are the ones who handle cheaper cars, that are sold out in the suburbs and the smaller towns. The representatives of these cars have from the very first wanted the show, and a number of them came together and decided to hold the event March 2-8. The patronage was offered the California Woman's Automobile Club. This organization has been most progressive of late, and accepted the offer with enthusiasm, as all the profits will go into their treasury. There is likely to be a little friction between those who want the show and those who do not. Already the officers of the club have canvassed the "Row" and have most flattering signed agreements. It is proposed to open the show with a big night parade, ending at the Coliseum, where the formal opening will take place.

Edwin L. Thomas, vice-president of the E. R. Thomas Motor Car Company, has arrived and is making his headquarters with the Pioneer Auto Company. Mr. Thomas will look over the automobile field, and especially that part which interests his company, concerning the taxicabs, which are likely to be put into service in this city shortly.

Paul Lacroix is in San Francisco, where he has established a western branch of the Renault Freres Selling Branch. R. J. Marx is to be manager.

Fernando Nelson, the enthusiastic autoist of this city, has again come to the front with what bids fair to break the record of unique suggestions for the entertainment of the officers and men of the fleet of warships soon to arrive in our harbor. He has proposed that every owner of an automobile shall loan his car for one day, and a line of march so arranged that it will reach all points of interest, and give the best views of the Bay and Presidio, be planned for the entertainment of these guests. The automobiles will be artistically decorated in the national colors.

INDIANAPOLIS SHOW DATES SET FOR MARCH 16 TO 21

INDIANAPOLIS, IND., Feb. 11.—Makers and local dealers have taken preliminary steps for the holding of the Indianapolis annual show, March 16-21. No building in the city being large enough to contain all the cars, the various dealers will have shows in their garages, assisted by men from the factories. Suggestions put forth for the event are that as an opening attraction a parade should be held on the afternoon of March 16 and that all automobile owners in the State be invited to participate. A local newspaper has offered a prize to the city or club having the largest number of automobiles

in line. There will also be a hill-climbing contest, probably at Glenn's Valley, and an obstacle race in the city. A banquet on the evening of March 21 will close the show.

A. E. Vinton, of the G & J Tire Company, has been appointed chairman of the temporary organization which will have the program in charge; P. D. Stubbs, representative of the American Motor Car Sales Company, has been appointed secretary, and R. H. Losey, of the Buick-Losey Company, is treasurer. Committees have been formed to look after the various parts of the program.

DIEPPE CIRCUIT AGAIN CHOSEN FOR GRAND PRIX

PARIS, Feb. 4.—Dieppe, which in 1907 was the scene of the highest rate of prolonged travel ever witnessed on road, will next July witness the third annual Grand Prix of the Automobile Club of France. The 48-mile triangle, with Dieppe at its northwest corner, has been a strong favorite since last year. Dieppe is near Paris; it is close to England; it is in the midst of a holiday resort district; it can attract and accommodate thousands of spectators; it can raise a substantial subvention—in brief, it makes the financial success of the race an absolute certainty; and, as the Racing Board of the A. C. F. is no longer indifferent to monetary matters, the Normandy circuit has triumphed. The question of roads hardly entered into consideration. There are a score of districts in France that could offer just as good a set of highways for racing purposes, but probably not one that could present such all-round advantages.

Ten thousand dollars in cash will be handed over by the Dieppe authorities for the privilege of having the race in their district. Further, the same authorities undertake to put the 48 miles of road in perfect condition at an expenditure of probably \$6,000. In no other country in the world have the rural populations been educated to a point where they would receive an automobile race with such enthusiasm or make such material offers to obtain it. One little village on the course, too small to entertain visitors, and destined, in consequence, to receive nothing but noise and inconvenience from the race, threatened for a time to act in a dog-in-the-manger spirit. Before the government will grant permission for any road race it is necessary that the consent of every village or hamlet on the course should have been obtained, so that it is always possible for a handful of men, if they desire to be stubborn, to hold up an event ardently desired by a whole département.

The grandstands, which last year were on a straight stretch of road parallel with the sea, will be erected on a portion of the road between Dieppe and Envermeu, and not more than eight hundred yards from the difficult Dieppe fork turn. Thirty-two acres of land have been secured at this point, at a rental of \$2,600, and it is on the inside of the circuit that immense grandstands, offices, restaurant, and the usual paraphernalia of a big road race will be erected. To enable visitors to leave the stands at any time during the race a spacious tunnel will be constructed under the road.

In all probability July 7 will be selected as the date of the Voiturette Grand Prix and July 8 for the powerful machines running under the 155-millimeter international racing rule. The Racing Board has taken the wise decision to cut down the entrance fee for the voiturette race by nearly one-half. Originally fixed at \$200 for a single car, it is now \$100 for a single entry, \$180 for a team of two and \$240 for a full team of three. The original entrance fee of \$400 was almost the market value of some of the small cars and threatened to drive away the small firms interested in the 15-horsepower runabouts. Under the new rules it is certain that there will be a record entry of small racers, and probably a race as keenly contested as the speedier one among the powerful flyers. Entry fees for the Grand Prix have undergone no modification. Twelve cars are now officially entered for the Grand Prix, the firms represented, each with full teams, being Germain, Benz, Fiat and Panhard & Levassor. Now that the course has been chosen, the twelve or fourteen firms known to be building racers will no longer keep back their entries. Last date for receiving engagements at ordinary fees is February 15. For the voiturette race Isotta-Fraschini is the only entrant at present, with three small four-cylinder cars. It is expected, however, that the entries will not be less than forty.

PREPARATIONS IN FULL SWING FOR SAVANNAH.

With seven actual entries and assurance from thirteen other firms that they will participate in the 360-mile stock chassis race, the Savannah meet, March 18 and 19, is assured of success. The engagements include two Apperson "Jack-rabbits," two Thomas-Detroit, two Isotta, and one Premier. Those having promised entries are Stearns, Stevens-Duryea, National, Mora, Studebaker, Dragon, York Pullman, Pennsylvania, Stoddard-Dayton, Fiat, Chadwick, Maja and Acme.

CHRISTIE WILL MEET THE FIAT AT ORMOND.

Walter Christie has taken up the challenge to race the Fiat *Cyclone*, a lightweight flyer recently imported, in a 100-mile match at Ormond in March. Christie, in sending his check for \$500 to Chairman Robert Lee Morrell, stipulates that the race be thrown open to all comers and be made a sweep-stake event, to which the challenger has consented. Christie has named the 130-horsepower direct drive car built for and entered in the Grand Prix last year.

HISTORY OF A RACER WHICH NEVER RACED

A RACING automobile which never raced has brought Alfred G. Vanderbilt, its owner, and François Richard, its builder, into a legal squabble over the payment of \$5,000 demanded by the latter.

In October, 1905, when preparations were active for the Florida tournament of the following January, Mr. Vanderbilt was introduced, through his chauffeur, Paul Sartori, to François Richard, said to be skilled in building racing cars. Order was given to go ahead on the construction of a 250-horsepower eight-cylinder racer to be the fastest car the world had ever seen. Three months was a short time in which to produce such a machine, but by working day and night, and engaging a special train at the last moment, the monster was on the Ormond-Daytona beach in time.

Unfortunately for the plans of the speed annihilators, the eight huge cylinders failed to give forth more than spasmodic explosions. A small army of mechanics wrestled with

it in the Hotel Ormond garage, while Alfred G. Vanderbilt looked on with ebbing enthusiasm. Finally the 250-horsepower 100-mile-an-hour flyer was shipped back to New York, carried to the garage, and left there. Mr. Vanderbilt was reported to have expended \$20,000 in his vain attempt to create a speed record. Later a bill for \$5,000 was received from M. Richard for three months' work on the car. Mr. Vanderbilt refused to pay on the ground that the car was a failure. The designer urged that the work was all that could have been expected, and that the car would have run had there been time to put it into condition.

In the Supreme Court, before Judge Girard, Thomas J. Fay, automobile expert for Mr. Vanderbilt, testified that if the car ran at all it would go twice as fast as the designer intended it to do, and instead of 250 horsepower, it would require 1,000 horsepower. The court found for M. Richard, enjoining the defendant to pay over the sum of \$1,250.

SUCCESSFUL H. H. FRANKLIN CO. SHOW IN SYRACUSE, N. Y.

MEASURE EXCELLENT; PASSAGE DOUBTFUL.

ALBANY, N. Y., Feb. 10.—In the bill of Assemblyman Wainwright, recently introduced, motor-vehicle owners get what they have claimed should be the law regarding the carrying of lights at night by horse-drawn vehicles on the country roads. Mr. Wainwright's bill provides that a new subdivision shall be added to the county law which shall empower supervisors of any county "to make laws requiring vehicles on the highway in the county to carry a light at night, and prescribing the character of such light. But such law shall not apply to vehicles required by any other law or ordinance to carry a light at night."

THAT BUFFALO-NIAGARA FALLS BOULEVARD.

BUFFALO, Feb. 10.—Announcement is made by the management of the automobile show that one day's receipts will be set aside in the hope of creating a substantial fund to be used in the promotion of the scheme to construct a boulevard from Buffalo to Niagara Falls. The plan has received the approval of local automobilists, according to Secretary D. H. Lewis, who says that members of the Automobile Club and representatives of the automobile trade are enthusiastic about it. Mr. Lewis announces that Thursday, March 12, will be known as Boulevard Day, and the admission price will be one dollar. All the money taken in at the door on that day will go towards the boulevard fund. Souvenir buttons will be issued and it is proposed to advertise the day extensively.

AEROPLANES FOR ARMY.

Three aeroplanes instead of one are to be built for the Signal Corps of the army, as a result of a decision taken by the Board of Ordnance and Fortifications, and approved by Secretary Taft. The three flying machines have been selected out of 41 bids made to the service, the successful ones being Wright Brothers, of Dayton, O., \$25,000, delivery in 200 days; A. M. Herring, New York City, \$20,000, delivery in 180 days; J. F. Scott, Chicago, \$1,000, delivery in 185 days. The funds at the disposition of the board only reach \$25,000, but it is believed that the balance will be voted by Congress during its present session in order to cover the cost of the other machines.

PROSPECTS BRIGHT FOR NEWARK SHOW.

NEWARK, N. J., Feb. 10.—Instead of finding difficulty in promoting an automobile show in this city, officials of the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association now find that they could have easily filled a larger hall than that at Electric Park, which the show will occupy from February 21 to 29. Decorators have been at work on the interior and the other preparations for the opening of the show have progressed so favorably that there is little doubt of everything being in place on the minute when the doors are thrown open. Horace A. Bonnell, secretary of the club, has already received the consignment of flags ordered for publicity purposes. They bear the inscription "Auto Show, Electric Park, February 21-29." These pennants will be distributed to dealers and club members and will temporarily supplant the familiar blue and gold club pennants. It is anticipated that next year will see an automobile show in the First Regiment Armory, or in the new Essex Troop's home, now in course of construction.

C. R. MABLEY RESIGNS AS SALON MANAGER.

At the meeting of the Importers' Automobile Salon, which was held at its offices in the Bryant Park Building, New York City, last Thursday, the resignation of C. R. Mabley as general manager, which was handed in the month previous, was accepted, and Mr. Mabley was given a unanimous vote of thanks for his good work on behalf of the organization during his term in office. W. R. Lee, who acted as Mr. Mabley's chief assistant, was appointed manager. It has been decided to combine the headquarters of the Importers' Salon with those of the New York Automobile Trade Association in the offices of the former in the Bryant Park Building, a very satisfactory arrangement having been effected between the two associations for the occupation of the same offices.

PROGRESS OF THE "MUDLARK" SOUTHWARD.

NASHVILLE, TENN., Feb. 10.—For the past 500 miles, Ralph Owen, who is driving the 40-horsepower Oldsmobile from New York to New Orleans, has found the going particularly strenuous owing to the January thaws and washouts, this city being reached 30 hours behind the prearranged schedule. On this account Chattanooga will be omitted from the route, the *Mudlark* having left here last Friday bound for Birmingham, Ala. Owen expects to be in New Orleans February 14, if the time lost can be made up. After the Mardi Gras, the party expects to take the car to Cuba for an island trip.

E. R. THOMAS TAKES A RIDE IN THE NEW SIX-CYLINDER RUNABOUT BEARING HIS NAME

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The two shaft-driven Lozier cars which Michener and Mulford will drive in the Briarcliff Trophy race, will each be four-cylinder models of 45-horsepower. In our last week's issue their rating was incorrectly given as 50-horsepower, thus giving the impression that the six-cylinder models had been entered.

According to figures received by the American Motor Car Manufacturers' Association, the American exports of automobiles during 1907 total 2,894, with a value of \$5,120,963, as compared with a total of 1,155 cars of a value of \$1,792,308 during 1906. This represents a gain of 1,730 complete cars with an aggregate value of \$3,328,655.

Carpet cleaning by automobile power is a familiar sight in San Francisco, and the patrons of the new system declare it a thorough success. The Le Clair Company, which is responsible for the innovation, owns a 1904 two-cylinder Winton, which carries a vacuum pump back of the driver's seat. When the car reaches the customer's house, a hose is extended from the pump to the house, and the power of the motor is used to drive the pump.

The Hicks Speed Indicator Company, of 1263 Atlantic avenue, Brooklyn, has just been reorganized, Carl Knopf, the president of the new company, being the only one of the old firm to retain his connection with it, although C. B. Sterling continues as sales manager. New capital as well as new blood has been infused into the concern, which has been reorganized on a larger scale than formerly. The officers are Carl Knopf, president; H. K. Carr, secretary and treasurer.

"Dealers in the West feel that conditions are improving rapidly and are much encouraged," says F. R. Bump, sales manager of the H. H. Franklin Manufacturing Company, of Syracuse, N. Y. "The banks have begun to supply all the money that is needed, and as a result quite a number of orders have been placed with us for immediate or early spring delivery. There is apparent a sentiment that the season will be a good one and that it will start with a rush before long."

Being desirous of placing their composite road wheels on the American market, the Atlas Motor and Engineering Company, of Levenshulme, Manchester, England, is open to enter into communication with any firm prepared to take up the manufacture and sale of its products. The wheels, which are patented in the United States and elsewhere, are a composite of steel and wood, and are built in various types for automobiles, commercial vehicles, omnibuses and horse-drawn vehicles.

Mule trails in the Southern California Sierras, over which an automobile had never passed before, were recently negotiated by a 1907 16-horsepower Model G Franklin in a break-neck trip from Los Angeles to the mines in the east of San Diego County. During the last twelve miles, an ascent of 5,000 feet, over twisting trails, was made by the dim light of oil burners, the acetylene lamps having given out. Mills Titus of Los Angeles, accompanied by three other men, drove the machine.

That the American "invasion" of Europe is not confined to automobiles alone, but

also includes accessories, and that even the crowned heads of the Continent are succumbing to this invasion is proved by a sale recently made by S. F. Bowser & Company, of Fort Wayne, Ind. This company had previously made several sales of their "long-distance" gasoline storage outfits in Dresden, and it is evident that their merits have been recognized, for recently an order was received from the King of Saxony for a five-barrel equipment.

E. V. Hartford, president of the Hartford Suspension Company, who is an accomplished musician, suffered an irreparable loss in the disappearance of two valuable old violins from the trap of his limousine, when returning from Lakewood, N. J., on Monday last. Mr. Hartford makes a practice of taking his violins along with him on pleasure trips, and the last thing known of the case containing them was the fact that it was placed on the trap of the car when leaving Lakewood. The jolting must have knocked it off. In describing his loss Mr. Hartford says that it is impossible to place a value on the violins, and he has placarded the roads, offering a liberal reward.

This is the time of year when the average owner of a car begins to look it over with a view to making such repairs as are necessary for the coming season. One of the most annoying troubles usually found on a car left unattended for several months is the cracking of the top or side curtains. Heretofore repairs have been made by patching, but a Saugerties (N. Y.) firm, the Montgomery-Washburn Company, has just placed on the market a waterproof compound, with the aid of which all cracks and leaks may be repaired without showing the repair itself on the surface of the material. Its composition is the same as that largely used by these makers for the waterproofing of tarpaulins, aprons and wagon covers.

"The new policy lately inaugurated by our company of opening branch houses in many of the larger cities instead of marketing our cars through local agents, seems to be meeting with great favor among car owners," says Colonel George M. Studebaker. In addition to our branches which have been established for a number of years, in the last few months we have opened new branch houses in Philadelphia, Boston, Cleveland and Seattle, and will soon open other branches at principal points not already covered, and we expect to handle our cars through these branches as long as our company is in existence. The purchaser of a Studebaker car in any of these cities is assured of good treatment as long as his car remains in commission, and that we will protect and further his interests in every way possible."

NEW AGENCIES ESTABLISHED.

The Post & Lester Company, Hartford, Conn., will open a branch retail store at Hartford, opposite the Allyn Hotel, about March 1.

Philadelphia's South Broad street colony was still further reinforced last week, when the Kissel-Kar was installed in a home of its own at No. 729. It will have the Dorris car as an agency mate.

Among the recent agencies established by the Northern Motor Car Company, Detroit

and Port Huron, Mich., to handle the "Silent Northern" for 1908, are the Hutchinson Motor Car Company, Hutchinson, Kan., and James F. Hutchinson, Jr., Union, Ore.

Charles E. Miller has just moved his Cleveland branch house from 406 Erie street to 1829 Euclid avenue, which now gives him a location in the heart of Cleveland's automobile district. A recently added branch house is located at 1392 Bedford avenue, Brooklyn, while others are established in Buffalo, Philadelphia, Boston and Detroit.

The Philadelphia agency of the Thomas car has changed hands, Joe Keir succeeding the Harry S. Houpt Company. Mr. Keir, who handled the Renault in the Quaker City for about a year, and a month or more ago assumed the management of the Bergdoll Motor Car Company, will take hold of the Thomas at once. The present quarters of the agency at 139-141 South Broad street, will be retained.

PERSONAL TRADE MENTION.

Rossell Drisko, well known throughout New England automobile circles, has accepted the position as general manager of Grout Bros. Automobile Company, Orange, Mass.

In Frank A. Sanford, the newly appointed Wayne agent for Greater New York, who has opened headquarters at 1853 Broadway, Barney F. Everitt, president of the Wayne Motor Car Company, Detroit, Mich., thinks he has the "right man" for the place. Mr. Sanford has been actively connected with the industry for several years past and is a staunch believer in the Wayne car. "The Wayne proposition from the start has impressed me most favorably from a pronounced desire on the part of the factory to produce a good article and then stand back of it in every sense of the word," he said, in speaking of the car. "I believe that the Wayne '30' at \$2,500, with magneto equipment, is as good a car as can be found on the American market to-day."

GEO. N. PIERCE'S RETIREMENT.

As a result of the reorganization of the George N. Pierce Company, Buffalo, N. Y., makers of the Pierce Great Arrow cars. George N. Pierce, the founder of the business, has retired from active participation in the company's affairs. He is succeeded by George K. Birge as president, the other officers being Henry May, vice-president; Charles Clifton, treasurer, and L. H. Gardner, secretary. The directors are George K. Birge, Henry May, Charles Clifton, W. H. Gardner and William B. Hoyt. With the exception of Mr. Pierce's retirement and Mr. Hoyt's accession to the board of directors, this is the same organization that has been in control of the company during the past ten years, during which period Mr. Hoyt has acted as counsel. Mr. Pierce has disposed of all his holdings in the company to his associates in order to relieve himself of the cares of active business, a step largely brought about by the ill-health of Mrs. Pierce, with whom he will go south for the winter. There will be no change in the active working forces of the company and no change in the well-defined policy long adhered to by Mr. Pierce as its head.

INFORMATION FOR AUTO USERS

Mascot Auto Clock.—A timepiece is one of the things that will probably never disappear from the dash of a car no matter how free the latter may become from other impediments, such as coils and oilers. It is as much of a necessity as the speedometer, and, realizing this, the Angier Company, 735 Boylston street, Boston, Mass., have brought out a neat, reliable offset dash clock at a price within the reach of

MASCOT AUTO CLOCK AND MOUNTING.

the man who can only boast the ownership of the lowest-priced runabout. It has been appropriately named the "Mascot," and consists of an Ingersoll, 24-hour stem-wind and stem-setting movement in a heavy, polished brass mounting, as shown by the accompanying illustration. It sells for \$4 complete and will make an attractive ornament for the dash of any car.

Almy Spark Timers.—As will be evident from the accompanying illustration of this device, it is of the platinum-contact type, the springs operated by the specially shaped cam being held at one end. It is designed to give positive and accurate timing on a four-cylinder engine, and by the use

MECHANISM OF ALMY TIMER.

of a double spring and cam the advantage of a wiping motion is gained at every revolution or lift of the cam wheel. This makes perfect electrical contact, keeps the contact points clean and prevents them from pitting. The Almy timer consists of a bronze base, in which is located either a plain or ball-bearing, a camshaft containing the roller to lift the springs and a set screw to fasten the device to the timer

shaft. The four double sets of springs are also mounted on this base and are enclosed by a protecting cover. The bronze base is so arranged that the springs are fastened to its face by posts, the upper posts being

SIDE VIEW ALMY TIMER.

insulated and extending through the back to form terminal connections for the wires. The ground connection is also fastened to the back. The advance lever is arranged to set at any point of the circle and is located at the extreme back of the timer. The lower springs are also fastened by posts and form the ground side of the contact, only the upper springs being adjusted, this being effected by merely slacking the lock nut and turning the adjusting screw up or down. By this means each cylinder of the engine can be made to fire at exactly the same point on the stroke. The Almy Timer, which is covered by a patent, is being manufactured and marketed by the Almy Water Tube Boiler Company, Providence, R. I.

The Combat Igniter.—"To get an efficient spark from a storage battery it must possess volume (amperage) and pressure (voltage) sufficient to make a quick, hot spark," say the makers of the Combat Igniter, the Commercial Battery Company, 204-206 Michigan street, Chicago, Ill. But there are quite a few other things essential in an accumulator

COMBAT IGNITER (STORAGE BATTERY).

for automobile ignition that will render satisfactory service, and, while the chemist must do his work properly, it will avail little on a car unless adequately housed. Particular attention has been

paid to the design of the Combat Igniters on this score, so that the makers guarantee the active material not to fall out of the grids, while their patented one-piece hard rubber cover prevents any of the liquid from getting out except through the vent plug for the gas, and then only when turned upside down. The central portion of this cover is so constructed as to form a well, thus holding any liquid that may get on top of the cell when replenishing the electrolyte or in recharging. Another feature of merit is a detachable japanned handle which drops to either side and may readily be put on or removed, no exposed metal being employed where it will come in contact with acid fumes. The Combat Igniter is made in two styles, one with hard rubber cases ranging from 4 volt, 10 ampere hour size up to 6 volt, 40 ampere hour size, and in polished oak cases from 6 volts, 40 ampere hours to 8 volts and 120 ampere hours. The same makers also market the Combat-Magneto-Generator-Cut-Off, which consists of one of their Combat Igniters with a small generator and an automatic cut-off, thus comprising a complete and self-contained ignition system.

The Telltale Tail Lamp.—Regardless of how they may differ on other points, the automobile laws in this country are uniform in the requirement of a tail lamp

TELLTALE TAIL LAMP AND BATTERY.

that shall light up the license number and show a red light to the rear. The law is not rigidly enforced in all localities, but where this happens to be the case, the autoist who falls a victim to it is innocent of any wrong-doing in nine cases out of ten. The lamp has either been blown out or joggled out, and in any case the driver's first intimation that anything has gone wrong usually comes too late to help him. To make such a state of affairs impossible, the Royal Battery Company, 108 Duane street, New York, has brought out the Royal "Telltale Taillamp," the name of which speaks for itself. The lamp is electric and the outfit consists of a four-volt, 40-ampere hour storage battery, a governor and the Telltale bell or buzzer. Once wired up on a car, the Telltale gives warning whenever anything happens to extinguish the lamp, regardless of its cause, whether it be from a broken wire, burnt out filament, run down battery or other accident. The electric bulb furnished with the outfit is provided with one of the new metallic filaments, thus reducing the current consumption to a minimum, so that the makers guarantee 125 hours light on a single charge of the battery.

THE AUTOMOBILE

AUTOMOBILE AS A RAILROAD CONNECTION

PARIS, Feb. 11.—There are a score of big cities in Europe with railroad termini so arranged that travelers from different parts of the country are dumped down at widely-separated points and left to find their way from one trunk line to another as best they may. Travelers from the north of England to the British Channel reach London and are turned out at one of the string of stations in Euston Road; north-bound wanderers speed from the Mediterranean with more or less luxury and velocity to find themselves stranded in the south of Paris with no very tangible means of reaching a northern depot. Without any injustice to the horse, the links between northern and southern railroad depots in London and Paris—and on a smaller scale in other European cities—may be described as crude. After eight or ten hours in a Pullman, with all the luxuries that modern travel has yet devised or Europe adopted, it is at least humiliating to be jogged across the streets of a capital by a weary quadruped,

often sorely taxed to keep the combined load of passengers and baggage in motion under advantageous circumstances.

Both French and English railroad companies have realized that they owe to their passengers some better means of transportation between city termini than two lean horses, a corpulent driver and a venerable cab. Apart from any possible economy in the journey, those hotels which first replaced the horse service between their own doors and the railroad depot by a series of automobile 'buses, have had no reason to regret the change, in view of the additional publicity the new means of locomotion has brought them. There are now scores of instances in English cities in which both hotel and railroad companies use automobiles exclusively for completing a journey to outlying points or connecting up arrival and departure stations.

Two notable instances of the ousting of the horse have occurred in Paris within a few days, the Orleans line having

STEAM OMNIBUS WHICH HAS REPLACED HORSE SERVICE BETWEEN THE LYONS AND ST. LAZARE STATIONS IN PARIS.

GASOLINE 'BUSES AWAIT ALL TRAINS AT ORLEANS DEPOT, PARIS.

put into service, at its magnificent station overlooking the Seine, a series of cabs and 'buses with special provision for carrying luggage, and the Lyons Company installing a service of steam 'buses between their own southern terminus and the Gare St. Lazare on the north side of the river.

Economic considerations demand that the taxicab should be a light, low-powered vehicle without the capacity for overloading, which is one of the redeeming features of the horse cab. Consequently for railroad work a special type of vehicle has to be designed, with provision for at least four passengers, and some place in which heavy trunks can be carried in safety. The Orleans company has met the situation by 20-horsepower four-cylinder cabs with closed bodies, the top of which is fitted with a metal gallery and built sufficiently strong to carry a heavy load. For larger parties small family 'buses, capable of carrying eight to ten passengers and the usual baggage attending such a group, are kept in constant attendance at the station.

Between the St. Lazare station and the Lyons depot, separated by four or five miles of crowded city thoroughfares, Darracq-Serpellet steam omnibuses now form a direct connecting link, uniting the two most important departure points of the city in a much more satisfactory manner than was ever done by the horse-drawn 'buses or the leisurely horse cab. In this case no special provision is made for passengers' baggage, the 'bus service being designed as a connection for the use of passengers between the two railroad depots. It is a connecting link, however, which will be much appreciated by those who have jogged over the paving stones in the old manner.

In all probability the adoption of the Darracq-Serpellet steamer for railroad work will prove to be the advent of steam automobile traction for the entire city of Paris. The lease of the present city omnibus company is on the point of expiration. It is not yet known who will obtain the next monopoly, but it is absolutely certain that when the change is made the main provision will be that every horse-drawn 'bus shall be taken off the streets of the city with the least possible delay. Among those most anxious to make the transformation is the Darracq-Serpellet combination with an army of steamers.

OLDSMOBILE MUDLARK REACHES NEW ORLEANS.

NEW ORLEANS, LA., Feb. 17.—Ralph Owen and the Oldsmobile "Mudlark No. 3" arrived this morning, having made the journey from New York via Buffalo, Pittsburg, Louisville and Nashville in twenty-two days. Owen had no mishaps worth mentioning, although he never encountered worse conditions than existed between Nashville, Tenn., and New Orleans.

STUDEBAKER CARRYING ARMY DISPATCHES.

With John Holm and William L. Walls as drivers, a 30-horsepower Studebaker carrying a message from General Frederick D. Grant, in command at Governor's Island, to all commandants at army posts between here and Ft. Leavenworth, Kan., left New York Tuesday morning, February 18. The route of the New York-Paris racers will be followed and the car will be driven night and day, each driver taking the wheel for twelve hours. Manager C. F. Redden, of the Studebaker Company, expects the 1,500-mile trip to be covered in ten days despite the adverse conditions.

EARLY JULY DECLARED TO BE A. A. A. TOUR DATE.

While no official announcement has been made on the date and starting point of the annual A. A. A. tour, according to an interview with Chairman Frank B. Hower in the *New York Times*, the week commencing Monday, July 6, has been decided upon, the most probable day being Wednesday, July 8. According to the same authority the start will be made at Buffalo, the run being an Eastern one with stops at Pittsburg, Philadelphia, New York, New Haven, Providence and Boston. Mr. Hower states that a definite announcement on date and place of the tour will be made in the near future.

A. A. A. FEDERAL REGISTRATION ACTIVITIES.

March 12, 1908, at 10:30 A. M., are the day and hour announced for the Federal Registration bill hearing at Washington before the subcommittee of the Judiciary Committee of the House of Representatives. Preliminary to this hearing, a conference of the delegates from the various clubs and associations will be held at the New Willard, Washington, D. C., Wednesday, March 11, at 8:30 P. M., and will be presided over by President William H. Hotchkiss and Chairman Charles Thaddeus Terry, of the Legislative Board of the association. It is urged that every automobile organization affiliated with the American Automobile Association be represented at the conference and hearing. The Automobile Club of Washington will entertain the visiting delegates informally at their clubhouse Thursday evening, March 12.

UP-STATE JUSTICE EMBEZZLES FINES.

ALBANY, N. Y., Feb. 17.—"Uncle" Jesse Van Ness, justice of the peace of East Greenbush, N. Y., has achieved an enviable reputation for his motorphobic tendencies. To put things briefly into the vernacular, "he soaked an autoist every chance he got, and the boys have been laying for him." Their turn has come as a result of an investigation undertaken by Bender & Hinman, attorneys in Albany, who were retained by the taxpayers of East Greenbush to find out what had become of the various sums of money collected by this "J. P." in the shape of fines. Though he imposed limit fines on almost every occasion, it has been found that all but \$200 of the money thus collected in the past two years has disappeared. According to the provisions of the law on the subject, such moneys are to be turned over to the supervisors within thirty days, or the latter must sue for it, but in the present instance neither step has been taken, while Van Ness has also violated practically every provision of the law calling for the filing of an accounting with the town board. The account was not itemized or verified, and the provision prohibiting an interested member sitting at a board meeting to pass on his own account was also violated.

As a defense it is contended that the board of supervisors passed a resolution authorizing the justice to spend the money thus collected in fines, but the taxpayers state that this resolution is void and accuse Justice Van Ness of having misappropriated and squandered about \$1,000, in support of which they cite specific instances to that effect.

AMERICAN CHAMPION FOR GRAND PRIX

AMERICA will have as her representative in the French Grand Prix, the swiftest and most keenly contested automobile race of the year, one Thomas Flyer racing car, with Montagu Roberts at the wheel. The decision to line up against France, Germany, Belgium, Italy and England in the race to be run on the Dieppe circuit the first week in July was only made at the last moment, the engagement of one car being cabled but a few hours before the official closing of entries. News has not yet been received from France as to the exact composition of the teams which will dispute the first race under the new international rule, but sufficient is known of the intention of European factories to predict the appearance of teams from every factory of importance in five European countries, providing probably fifty cars.

The Thomas people state that they will use a stock chassis in the European race, with such adaptations as are necessary for the fast course on which it is intended to be run. The Ostend rule, under which the Grand Prix is being run, allows a bore or not more than 155 millimeters (6.102 inches) for four-cylinder engines, there being no limit to the stroke; total weight must not be less than 1,100 kilos. As the 60-horsepower Thomas Flyer is 5 1-2 inches bore and stroke, it will doubtless be the lowest-powered car in the race, all the European constructors having decided to build up to the maximum bore with a stroke varying from 6 1-2 to 7 1-2 inches. Last year, with engines averaging 7 by 6.2 inches bore and stroke, an average speed of 70 miles an hour was attained by the two leading cars, the highest rate of travel ever reached in a long-distance road race. Despite the reduced bore, many constructors believe they can equal this record. Whether this is done or not, it is certain that the winner will be an exceedingly fast car.

Exact Date Now Fixed for Grand Prix.

PARIS, Feb. 10.—Monday and Tuesday, July 6 and 7, are the days chosen for the two Grand Prix races to be run on the Dieppe circuit by the Automobile Club of France. In all probability Monday will be reserved to the racing runabouts limited to 3.9 inches bore for a single-cylinder car, and Tuesday for the four-cylinder 155-millimeter racers. Though this would be the most natural way of holding the two races, an official decision has not yet been arrived at by the Racing Board. Despite minute precautions, there is an ever-present fear of accident, and should any mishap of a serious nature occur on the first day there is a possibility of the government forbidding the running of the second day's race. It is for this reason that some of the members of the Racing Board would put the big race first. Though there is every probability of as many as 60 competitors engaging in the Voiturette Grand Prix, there is in reality little fear of accident, the course being wide, tarred, stoutly barricaded and guarded by several

infantry and artillery regiments, gendarmes and local men.

Weighing-in for all cars will doubtless take place Saturday and Sunday preceding the races. On the Sunday, also, it is intended to hold motor boat races off Dieppe, unless there should be promise of British entries, in which case the nautical races would be held on Saturday afternoon, in consideration of the English objection to Sunday sports.

Details in connection with the course are being pushed forth with rapidity. The race having been held here last year, there is, of course, comparatively little to do. A few more trees may have to be chopped down, a little patching and rolling done, and the entire course retarred. But all this devolves upon the Dieppe authorities, who have undertaken, in consideration of the race being held in their district, to furnish a perfect set of roads. Grandstand arrangements are entirely different to those of last year. Instead of being

RACING BOARD INSPECTING COURSE ON A POWERFUL PANHARD.

on the outside of the course, with their backs to the sea, the stands will be on the inside, on the leg of the triangle running from Dieppe to Envermeu. They will be sufficiently near the hairpin turn for spectators to look across the angle and watch the cars approach the "hairpin." At each end of the main stand a high tower will be erected, the privileged occupants of which will have a unique view of the cars running parallel with the seashore, the "hairpin" turn and the straight-away in front of the grandstands. To the rear of the grandstand seats is planned a wire promenade, from which it should be possible to obtain an excellent view of both lengths of road. Gasoline and tire stations will be directly in front of the grandstands, on the out-

side of the circuit. As the regulations call for all work to be performed by the driver and his mechanic, and there will be only one other station on the course, occupants of the grandstands will always have before them plenty of interesting work.

Connection with the outside of the circuit will be made at the grandstands by a wide tunnel, and at various other points on the course wooden bridges will be constructed for the use of foot passengers before and during the running of the races.

Governmental permission to hold the Grand Prix on the Dieppe circuit has been accorded by Premier Clemenceau. A deputation consisting of the Dieppe authorities and officials of the Automobile Club of France presented their formal request this week and were immediately assured not only of the Government's approval, but of the intention of the Premier to be present if possible. No additional entries have been received for the Grand Prix. For the voiturette race to be run on July 6, ten cars are now engaged, including teams of three from Isotta-Fraschini, Lion-Peugeot, Rolland-Pilain, and one Foullaron. One voiturette builder, winner of the last race of this nature, at a speed of over 40 miles an hour, has stimulated interest by declaring that he will

MAYOR OF DIEPPE AND RACING BOARD OF FRENCH CLUB.

average 60 miles an hour with a 3.9 bore single-cylinder car. The engine will have a stroke of 5.9 inches and will run at 2,500 revolutions per minute. Such extraordinary results were obtained at the voiturette race in the fall that the constructor's declaration is generally accepted as more than an idle boast. A special trophy valued at \$600 has been offered by the *Petit Parisien* to the winner of the voiturette race. The town of Dieppe has also come forth with the announcement that it will subscribe a handsome trophy to be presented to the winner of the Grand Prix, whatever his nationality. An erroneous impression had got abroad that this trophy would only be awarded if the winner of the Grand Prix were French. Special prizes will probably be offered for the fastest flying kilometer.

CLUB DELEGATION VISITING PREMIER CLEMENCEAU.

WHAT IMPRESSED MICHELIN IN AMERICA.

PARIS, Feb. 10.—Edouard Michelin, the younger of the two brothers who created the great tire firm, has given a Paris reporter the benefit of some of the ideas which struck him as particularly good during his recent visit to the States in connection with the formation of the American Michelin Company and their new factories at Milltown, N. J.

"While not going to America to study character and conditions, but to work, I was particularly struck with the importance of time in all industrial undertakings. Occasionally we admit time is valuable; but in America time is the great principle of all industrial movements. To build our factory we got in touch with several firms. All of them gave us three prices, for three months, six months, and one year, with enormous differences. It was not a matter of the importance of the labor, they explained, but one of material. Should they use the steel, iron, stone, etc., kept in stock, at prices demanded by those who had the material ready, or should they pass special contracts, causing a delay, but allowing special rates.

"The way in which supply dealers of all kinds interest themselves in their customers struck me particularly. Here

HOW GRANDSTANDS WILL BE ARRANGED ON DIEPPE COURSE.

in France we ask for something, a price is stated, we agree, we pay, the goods are delivered, and that is the end of it. There is nothing of that in the States. Every dealer or supplier gives you the full benefit of his experience.

"When we need a fire insurance an inspector comes, asks a few general questions, just for formality, and the company gives its rates, generally very high. In America the examination is the most important part of the affair, and the inspectors are the grand masters of the company. They examine the affair and say, 'We want so much per cent.; but if you will let us organize your factory against fire risks, and make use of our experience, which has covered hundreds of examples, we can give you much better terms'; and often those terms show a reduction of 50 per cent.

"Another good point is the confidence you can have, with but rare exceptions, in the firms estimating to undertake work for you. The base of this honesty is the power of credit. A man operates, in general, with ten times what he really possesses, and he is always seeking to increase his figure. Thus there is necessity for credit, and equal necessity to work squarely, or see the credit lost forever. It is an open, public credit, and the most level-headed man is the one who always keeps on the honest side. It was this system which was one of the causes of the last crisis. The American just coolly cut out a few rotten affairs, that is all."

EARLY DIFFICULTIES ON RUN TO PARIS

ALMOST before the round-the-world tourists had got out of sight of the City of New York on Wednesday, February 12, a thaw set in, transforming a naturally unsatisfactory highway into a veritable quagmire. Instead of reaching Albany the first night, as arranged on the schedule, no car got beyond Hudson, 116 miles out, two even stopping at Peekskill after a run of but 44 miles. Despite the reiterated statement that American roads are not like those of Europe, the foreign drivers were totally unable to realize under what conditions they would have to travel within a few hours of the start. The result was that instead of being unprepared for the run, as some who evidently had had no opportunity

the train at Ogden, Cheyenne, or some more easterly point if necessary, the Frenchman is probably more sagacious than is generally acceded in abstaining from a race which could not do him one iota of good, and might incapacitate him for the later trip through Siberia, Russia and Europe. Paul Pons and his little single-cylinder Sizaire-Naudin were worthy of a better fate. At Montrose, 40 miles out, rear axle troubles necessitated the dismounting of that organ, an operation occupying three days, and when the work had been done a further tie-up occurred at Red Hook, 96 miles from the starting point. Unable to utter a word of English, with no American agency to which they could apply for parts,

HOW THE CONTESTANTS LOOKED FROM AN UPPER STORY OF THE "TIMES" BUILDING JUST BEFORE THE START, WEDNESDAY, FEB. 12.

of examining the machines in detail have declared, the competitors were overprepared. Quantities of stores that could have been of no possible value until Arctic regions were reached were unwisely carried on the cars the first three days.

Very early in the run Roberts showed that he had the fastest car in the Thomas Flyer, the Italian Zust and French De Dion, however, keeping close behind. The Protos with its German crew made good going, but was too ponderous for speed. Godard, who had privately declared before setting out from Times Square that his Moto-bloc would be in the rear all the way across the United States, thoroughly lived up to his promise, and though having but trifling mechanical trouble, was 100 miles behind the leaders as early as the fourth day. As all the competitors will have to ship on

A TRIO OF NOTABLES.
Hoyt fires starting gun, Morris and
Thompson assisting.

the Sizaire crew labored under heavy disadvantages, yet Pons says he will continue.

After blazing a trail for two days, Roberts concluded that it would be wiser policy to share the honor of leading with his competitors, and accordingly fixed up an agreement with the crews of the De Dion and Zust whereby each car alternately made a track through the snow and mud in which the others could follow. Some idea of the difficulties of traveling through New York State can be gathered from the fact that though taking advantage of every hour of daylight the mileage rarely got above one hundred, the figures for the leaders on the first six days being 116, 90, 69, 87, 109 and 95.

Undoubtedly the most difficult portion of the journey was the run to Geneva on the fourth day. Heavy rain had followed the fall of snow, giving a surface which alter-

THOUSANDS SAW THE START OF THE LONG RUN.

nated between twelve inches of mud and snow drifts from two to three feet in depth. At Dismal Hollow, an appropriately named spot in the Montezuma marshes, the three leaders, Thomas, De Dion, and Züst, found themselves hopelessly stalled at the foot of a steep hill with several feet of snow ahead and swamps on all sides. Only after three hours' labor and the assistance of teams of horses were the cars able to get out of their difficult position and proceed to Geneva.

Thomas Led the Way to Buffalo.

BUFFALO, N. Y., Feb. 17.—Buffalo has received, entertained and passed on the New York-to-Paris cars. Montague Roberts, driving the Thomas Flyer, was the first to reach this city. He got here about 2:15 o'clock Sunday afternoon,

ABOVE YONKERS, ALONGSIDE HUDSON, TRAVELING EXCELLENT.

something like two and a half hours ahead of his French competitor, the Dion-Bouton. The Züst, flying the Italian flag, got in Buffalo at 5:15 o'clock Monday morning, registered at the Western Union office, and, finding nobody here to welcome them, the drivers passed on towards Cleveland. The Italians believed the other two cars had got right on, but when ten miles along the lake shore learned otherwise. The Thomas was met at Williamsville by representatives of the E. R. Thomas Motor Company and the Diamond Rubber Company, with whose tires it is equipped. The Pierce Company lent all local assistance to the foreigners.

Leaders Nearing Chicago; One Car Quits.

After seven days' running, Roberts had reached Toledo, distance 785 miles, with the De Dion 29 miles behind at Fremont and the Züst making a moonlight run from Cleve-

land to overtake the faster cars. The German Protos put into Erie for the night. Godard, still refusing to be hustled, stabled his Motobloc at Buffalo, thoroughly satisfied with his performance. After every possible attempt to repair its broken differential, the little Sizaire-Naudin has been withdrawn from the run, after covering but 96 miles. It was impossible to obtain a new rear axle in this country.

Interrupted Progress of the Werner.

PHILADELPHIA, Feb. 17.—A man may be French and a daredevil, and may even have been the first to suggest the New York-Paris race, but that does not signify that he is capable of running an automobile safely. Such, with much gesturing and shrugging of shoulders, is a free translation of what M. Drieghe, representative of a Paris newspaper, says about M. Lelouvier, who ran the Werner independent entry over

ROBERTS AND THOMAS CAR LED THE WAY TO BUFFALO.

from New York on Wednesday, and, according to his companions—M. Hohmann bears out M. Drieghe's statements—demonstrated that he wasn't familiar with the game.

Barring counters and swings, the two days spent here waiting for the Quaker City Automobile Company's men to whip the Werner back into shape were a regular Donnybrook Fair performance. Verbal battles in pure Gallic were numerous, and when the start was made Saturday morning Lelouvier had been deposed from the wheel, and Drieghe was in his place. The former sulked and refused to go along, but bade his compatriots an apparently effusive farewell and hied him back to New York, some said to wire Paris to stop the rebels, others to get another car and beat the Werner.

PONDEROUS, THOROUGHLY-EQUIPPED, SLOW-GOING MOTOBLOC.

CLEVELAND'S SHOW ATTRACTIVELY SUCCESSFUL

CLEVELAND, Feb. 17.—It didn't look much like depressing times at the opening to-night of Cleveland's seventh annual automobile show. Never before in the history of Cleveland shows was there so large and brilliant a crowd and never before such a varied and brilliant display as were to be seen in Central Armory.

"There are only two cities in the country that have anything at all on Cleveland in the line of auto shows, and those are New York and Chicago," said a man this evening who has attended similar events for years. This year the show committee spared no expense to make this the most attractive local show on record. They imported from New York M. A. Singer, who has had charge of decorating Madison Square Garden for several previous shows, and they gave him almost unlimited leeway to make this the best ever. The color scheme is white and gold. Canopies in white are draped all around the building. The pillars through the center are white. Along the railings of the galleries and clustering around the pillars in the center and outlining the signboards are lights shaded by tulip shaped art glass. The ceiling is draped from the center in gold and white. Surmounting the railings of the gallery are posts with Nernst lamps around, and under the gallery are rows of gold and white lights, while the chief lighting effect comes from a dozen huge globes of incandescents hung from the ceiling. The entire effect is lighter and brighter than ever before. The arrangement of the floor spaces differs from that of previous shows. There are no center aisles. Instead there are the posts through the center with 12-foot aisles at the sides.

The Cleveland show committee undoubtedly made a wise move in delaying the show until February instead of holding it in the circuit of big national shows. The financial feeling is much better than it was two months ago, and the dealers all report that the prospects for business are growing brighter every day. The curtailment of outputs of many of the big makers had made some of them worse off for prompt de-

HOW THE CLEVELAND SHOW LOOKS FROM CENTRAL ARMORY GALLERY.

liveries than ever before. Even people who had plenty of money were afraid to do business two months ago, where now they are satisfied with the outlook and are ready to close deals.

One of the noticeable points about the show this year is the predominance of the six-cylinder. Last year but three "sixes" were shown at the Cleveland show, and none of this type was built by Cleveland factories. This year the Winton factory is committed entirely to "sixes"; the Peerless, the Stearns and the Royal all have their big models, while among the out of town "sixes" on exhibit are DeLuxe, Thomas, Ford, Olds, Pierce Great Arrow, Stevens-Duryea, Chadwick, Premier, National and Stoddard-Dayton.

Of course comparatively little is on exhibition here that has not been shown at previous big shows. Paul Gaeth, who has catered heretofore largely to his home trade, but this year has gone after business in many sections of the country, exhibited his 1908 models at New York and Chicago, but also reserved two or three new ideas for the Cleveland show. One of these is a device for starting the motor on the spark with a make-and-break type of ignition. A new model, known as the Tourabout, has a low hung forward slanting top and a "V" shaped removable glass windshield, the whole design of the car being with a view to reducing the wind resistance to a minimum. Another new Gaeth model is a sort of a semi-limousine. For winter use the rear portion of the car is closed up tight, while for summer use the large rear and front window can be removed and the side windows, which are in two sections, also come out, giving free circulation of air on all sides.

This year there are no racing cars, or at least cars that are described as such. In fact, there are few novelties. One of the most interesting is what is said to be the first steam auto built in this country, by Achille Phillin in 1890 for advertising purposes, and exhibited at Tattersall's, Chicago, in 1892. The list of the exhibitors is as follows:

SOUTH WANTS A. A. A. TOURISTS TO TRY ITS ROADS

NEW ORLEANS, LA., Feb. 15.—The cry of the South for the A. A. A. tour for 1908 is becoming louder and louder. The South thinks that she ought to have it this year, and the contention seems to be justified. But as the West is also making a strenuous effort for this tour, the opposition is much greater. The East has had the tour for two seasons now, and the protests from the other sections of the country are timely. Local automobilists are of the opinion that more real good can be accomplished by holding the tour in some other section of the country than the East. They argue that the East and Central Northern States are far ahead in regard to the automobile and its running mate—good roads. The spirit of good roads improvement is just in its infancy in the South, and such a tour as that of the A. A. A. will undoubtedly do much toward fostering this movement and giving it a healthy start.

The tour just completed by Ralph Owen in his Oldsmobile "Mudlark No. 3," from New York to New Orleans, has been watched with more than ordinary interest by automobilists all over the South, and, in fact, in the whole country. The route selected by Owen partially was a virgin one, as far as the auto is concerned, but he made excellent progress, despite the weather conditions and the season.

Already a number of prominent automobile enthusiasts in this city and other Southern cities are advocating the use of the route taken by Owen as a good one for the next Glidden tour. At any rate, the result of his tour will doubtless have much to do with the selection of the route when the time comes. Southern autoists contend that in the A. A. A. the South gets little recognition.

Several other routes have been suggested by prominent local members of the Louisiana Automobile League. One plan is to effect a compromise with the West, and make a Western-Southern tour, beginning, say, at Denver and ending at New Orleans. Another is to make the start from New York, fol-

low the Coast States to Atlanta, and then swerve westward. All may rest assured that the South will make strenuous efforts to land the Glidden tour either for this year or next. They are willing to let the West have it this year, if the South can be assured it for 1909. And it looks as if they might get it, for 'tis a "solid South" for the A. A. A. tour.

North Carolina Has a Route for A. A. A. Tour.

CHARLOTTE, N. C., Feb. 18.—The Greater Charlotte Club, an industrial organization, has submitted to the American Automobile Association a route for the next Glidden tour, to include many Southern cities. The club is very anxious to have the automobile tourist come through the South, contending that as good roads can be had in this section as in any part of the country, and believing that to have the tourist touch various Southern cities will have a great effect in securing better roads for the South.

The American Automobile Association, through its Touring Board, has assured the Greater Charlotte Club that its proposed route will be carefully considered by the committee having the matter in hand, and that the South's merits will be given due consideration.

The route as outlined for the tour is over a country with ample hotel accommodations at intervals of 100 to 150 miles, which is necessary for the several hundred contestants and officials. The proposed route begins at Buffalo, the starting point, and will reach as far South as Atlanta, at which point the route will turn back northward.

The cities included in the route are Cleveland, Akron, Columbus, Dayton, Cincinnati, Ohio; Lexington, Frankfort and Louisville, Ky.; Nashville, Murphysboro, Chattanooga, Tenn.; Rome, Atlanta, Athens, Ga.; Greenville, Spartanburg, S. C.; Charlotte, Winston, N. C.; Danville, Lynchburg, Staunton and Fredericksburg, Va.; Washington, Baltimore, Philadelphia and New York City, back to the starting point.

NEW JERSEY AND ITS TROUBLESOME AUTOMOBILE LAW

NEWARK, N. J., Feb. 17.—Exactly what will be the outcome of the various conferences between the automobilists and the State officials concerning a revision of the present so-called Frelinghuysen law remains to be decided.

Last week Senator Frelinghuysen introduced at Trenton a set of amendments to his own law, the registration fees being raised from the present rates to the following scale:

Class.	H.P.	Fee.
First	11-15	\$3
Second	16-20	5
Third	21-25	10
Fourth	26-35	15
Fifth	36-50	20
Sixth	51-70	25
Seventh	71-90	35
Eighth	91-120	100

The drivers' license fees are raised from \$1 for drivers of vehicles below 30 horsepower and \$2 for drivers of 30 horsepower and above to the following scale: \$1 for first-class, \$2 for second-class, \$3 for third-class, \$4 for fourth-class, \$5 for fifth-class, \$10 for sixth-class, \$15 for seventh-class, \$25 for eighth-class.

To-day W. C. Crosby, chairman of the legislative committee of the New Jersey Automobile and Motor Club, and R. A. Greene, representing the dealers of the State, visited Trenton and had a conference with Governor Fort, Senator Frelinghuysen and Commissioner J. B. R. Smith. Senator

Frelinghuysen stated he would be favorable to a new schedule calling for \$5 for anything from 1 to 19 horsepower, \$10 for 20 to 39 horsepower, \$15 for 40 to 59, and \$25 for 60 or greater horsepower machines. It was also decided to issue no manufacturers' licenses except to New Jersey dealers.

Reciprocity in registration for automobilists from other States was announced by the State official to be impossible at this time. Apparently the present administration considers that the automobilist should contribute most liberally to the upkeep of the highways, but the impression continues to prevail that visitors from other States will be fewer than ever in New Jersey this year.

Commenting editorially, the Newark News says:

The general criticism of the proposed amendments lies in the fact that they aim solely at increased revenue, rather than greater safety for the traveling public, and in doing so exact tolls from the automobilists in general that are hardly equitable. * * * In this connection it is only fair to ask why the automobile is the only vehicle which must pay for the wear entailed upon the roads. Granting that it is more destructive to macadam than others, it is probable that more wear is entailed by horse-drawn vehicles, because they are so much more numerous. Certainly roads were worn before automobiles were dreamed of, and certainly roads are worn to-day by "sharp shod" horses and the steel tires of wagons and carriages. It would seem, therefore, that if road users are to keep roads in repair, which is entirely logical, all vehicles should pay an equitable tax. It may be popular to shoulder the entire burden on the motorist, but it hardly squares with one's sense of justice.

PROBLEMS IN THE REPAIRING OF AUTOMOBILES

By THOS. J. FAY, E.E., PRES. SOCIETY OF AUTOMOBILE ENGINEERS

It would seem a simple matter to replace a broken part in an automobile, using the broken part as a pattern to go by. The duplication of the part may be a plain task, requiring no great skill; but it does not of necessity follow that the repair so made will be satisfactory.

Consider, for instance, a *cardan* shaft for, say, a 30-horsepower car, with a diameter of 40 mm. and of regular contour. It would be very easy to duplicate the size in a new one, using the old shaft as a guide in the process. This is not to say the new shaft would be the equal of the one displaced, the materials might not be of the same quality.

A repair then does not consist in merely duplicating the part from the *size* point of view. The *materials must be duplicated as well*, or, better yet, since the displaced shaft showed lack of staying qualities, to use a better grade of materials in the new shaft would be more to the point. On the other hand, to use a greater section of the same, or an inferior grade of materials, would not be a justifiable procedure for several reasons, among which the question of the increase in weight is one never to be lost sight of. If a car is made of inferior materials, the question of the quality of the materials to use in the repair of the same is still an important matter, since to prevent future rupture of the same parts would be the important matter.

A car may be *truly good* in the main, while the same car may be most unsatisfactory on account of the repeated failure of some one or two of the important parts, thereby causing service interruptions and costly repair bills.

It is the repair man who can remedy such matters, because it is to the repair man the car will go in quest of balm for its wounds. It is the repair man who should alleviate the distress of the suffering autoist. If the automobilist is accorded no more than *further license* to put up with additional interruptions of service at additional cost, *'tis not a repair at all*.

Things That Have to Be Determined.

Does it come within the province of the repair man to determine as to the adequacy of the strength of the parts? Not of necessity. Indeed, there is no need to determine as to the *facts!* If the parts rupture, they are not of the requisite strength.

The history of the failure will determine much towards clearing up the difference as between a rupture due to a clear accident and that involving the inferiority of the material. It might be said, instead of inferior material the section is below the requirements; this is not the best way to look at the matter, since, if the materials are not of the best, using a better grade of material has the effect of rendering the section adequate without increasing the weight.

But, supposing the material is of the best to be had. Even so, it will be possible to attain additional strength by a *heat treatment*. In this way it will still be possible to keep the weight of the car within the original limits. If the weight question is not kept in mind there is no telling where the car will end from the weight point of view.

If, on the other hand, the materials are of the best possible to use and they are heat treated, to afford the maximum strength, yet with all the parts fail to sustain the load, it would be a reasonable inference that the section should be increased.

It does not follow some incongruity of design may be at the seat of the evil. There may be a shoulder, an abrupt turn, or perhaps a lateral, fixing the point at which the stresses will be concentrated. A little thought, some slight alteration, and the difficulty will disappear.

Is it worth while to the repair man to thus expend *gray matter*? Is it not his plain duty? Certainly! For why is a car sent to a repair shop, if not to be put in good repair?

Surely a fault in the car, such as will lend uncertainty to its performance, renders it otherwise than in good repair.

It is not proper to fall back on the presumption of original defect. If the owner of a car wants the same put in good repair, the order includes all faults, original or incidental to service. Of course, this is not to say that one should redesign every car that comes in for repair. This is not the point at all.

The point is that if a member ruptures, and it is to be replaced, some effort should be made to render the repair of a permanent character. "*Once well done, twice done.*" If a little investigation will end in the disclosure of the fault in design at the bottom of the failure, to take the time is not only desirable, but essential.

If it is plain that the replacements should be of materials at least as good as the materials failing in *normal* service, it is equally plain that the repairman should pursue some course consistent with the needs of the occasion.

True, it would not be possible to have a thorough investigation of the ruptured parts made each time a car is entered for repair; but it would be possible to follow at least one of two courses. That is to say, it would be desirable to know what the respective makers use by way of materials in the various parts of their cars; or, to provide certain standard grades of materials, for the respective parts in the absence of definite knowledge in relation to the practice of the respective makers.

These are not matters beyond the pale of plain practice, nor would one have to stay up o' nights to the tune of midnight oil in quest of the requisite amount of information. Surely it is well worth while.

Value of Good Material in Repair Work.

The question of the price of good material for use in repair work is a matter of almost no moment at all, because the proportion of the whole cost of a repair, directly chargeable to material, is generally less than ten per cent. Whether or not the ten per cent. is halved or doubled is certainly secondary to the matter of a permanent repair.

If a repair shop desires to be particular about this matter of the material, a very simple and quick way to ascertain the required quality of the material to be duplicated might be as follows: Take discs of standard grades of materials of known characteristics, say, one inch in diameter, and possibly one-quarter-inch thick (thickness of no great importance), polish one side of the discs and, with a magnifying glass (power of the glass twenty diameters), compare the parts to be replaced with the standards until they match up. It will, of course, be necessary to polish a spot on the parts to be replaced to render the comparison more certain.

Care should be exercised to carefully mark the respective standards, thereby to know of what materials they are composed; he who depends upon memory skates on thin ice. The magnifying glass of the power, as above given, may be had at any first rate optician's at a cost of about twenty dollars.

It is not even necessary to know the *chemical composition* of the materials of the standard discs, or much besides, provided the materials are of staple brands of the different grades, readily procurable, with some certainty.

The method is but an approximation, not to be regarded as a fine test of the products; it is purely relative, but it does serve a very useful purpose. Certainly there are other more exacting methods of establishing the facts, but they take more time, require more skill, ending in more uncertainty in the hands of the busy practitioner.

It takes a little practice to render one proficient in the use of a twenty to one glass, the lens being scarcely more than 1-8-

inch in diameter. It is something to have good light, and a clear north exposure may be superior to artificial light; but to invariably resort to the same source of illumination may be a point in favor of uniform results.

Generally when a shop awakens to the fact that the methods in vogue are not in keeping with up-to-date practices, the first shot out of the box is to go to extremes. The end is as the frog in the well. The best way is to creep—then walk—get used to somewhat more exacting methods, and persist.

Conscientious repair work is no more necessary than honest banking methods, *but it is no less a necessity*; the shop that does pursue an honest and skillful course will be prosperous long after the other kind *lies slumbering in oblivion*. This is not to say the price of the repair should be low, the price question is a separate matter to be governed by the cost of the work and the profit desired.

If, however, the price is to be the same if the quality of the work is good or otherwise, then dishonesty runs rampant in the latter case. At all events, to claim to be doing things in a skillful way, with facts to the contrary, is but to dig a grave, and *thereby hangs a tale*.

The question of how the respective materials will look under the glass is not a matter to worry about, since it will be plain to the investigator, when the part to be replaced, looks like some one of the standard discs. To be able to match up, it is desirable to provide discs of the various grades of materials usual to automobile practice, they being as follows:

- (I) Mild Bessemer steel.
- (II) Basic Open Hearth steel.
- (III) Acid Open Hearth steel.
- (IV) Acid Open Hearth steel (Basic bottom).
- (V) Nickel steel.
- (VI) Chrome Nickel steel.
- (VII) Chrome Vanadium steel.
- (IX) Swedish Iron.
- (X) Crucible steel = (III), (V), (VI), (VII), (VIII).

The chemical composition of the various steels will depend upon the service to be rendered and the process. Under the glass at twenty diameters it will not be possible to tell as to the process by which a product may be fabricated, but it will be possible to note the difference as between (I) and (V), or (II) and (VI) without great skill.

It will also be easy enough to pick out (IX) from say thirty carbon steel.* *These are not matters of maximum importance*, if only one can be sure of procuring the various grades of steel of uniform *known* qualities and be advised of the abilities of the respective grades of steel.

With a view to showing the extent to which the various grades of steel do differ in fact, even though the differences are not perceptible to the naked eye, some micro-photographs of the various steel products will be offered.

It is also true that the effect of *heat treatment* shows very clearly in the micro-photographs, as will be seen by an inspection of those offered for the purpose.

Fig. 1 shows the micro-photograph of a specimen of basic open hearth steel under the conditions, viz.:

Magnifications.....	350
Etched.....	deep
Heat treatment.....	{ Quenched at 950° C. Annealed at 550° C.
Metalloids.....	low
Carbon.....	0.35%

This is a very poor micro-photograph of a grade of steel that is far from desirable for use in crankshafts, which is what the steel was used for. It is not that the chemical composition

*Thirty carbon steel! This is to express the carbon content, in points. One point is equal to one one-hundredth of one per cent., thus, 0.001%; hence one hundred points equal one per cent.; thus, 1.00%.

FIG. 1.

would be regarded as undesirable; for such is not the case. The fault lies in the *open* and non-silky nature of the appearance of the fracture. It is a question if basic open hearth steel will be nearly so good as the strictly acid fabrics, in any case; especially for crankshafts. The physical properties of basic (35 carbon) steel may be set down about as follows:

Tensile strength in pounds per square inch.....	78,500
Elastic limit in pounds per square inch.....	60,000
Elongation per cent in 8".....	25
Reduction of area, per cent.....	55

The above approximations will hold, only if the steel is well fabricated and is carefully heat treated in accord with the specifications. The same grade of steel in the normal state would probably show physical properties as follows:

35 CARBON BASIC O.H. STEEL (NORMAL)

Tensile strength in pounds per square inch.....	78,500
Elastic limit in pounds per square inch.....	28,500
Elongation per cent in 8".....	24
Reduction of area in per cent.....	54

The repair man is likely to use the steel in the normal state, with the result that *the repair will scarcely be permanent*. But it is also easy to see how the builder of the car may do the same thing, thus fully accounting for the need of repairs. Let us take this same 35 carbon steel and examine it from still another point of view; it is a product much used in automobile work; we cannot well know too much about it.

35 CARBON BASIC O. H. STEEL: TREATED

Tensile strength in pounds per square inch.....	130,000
Elastic limit in pounds per square inch.....	26,000
Elongation per cent. in 8".....	2.00
Reduction of area in per cent.....	4.50
Treatment:	Water quenched at 900° C.

Obviously the steel can be rendered as brittle as glass; it has a wide range of properties; the carbon contained renders the steel very susceptible of heat treatment; therefore, skill is essential to success in the use of any such fabrics. The fact that the steel is *basic* renders its treatment a matter of far greater

FIG. 2.

concern, since it is to the basic steel we owe much by way of inferior steel, due to the use of inferior ores. It might be said, the inferior qualities of this class of materials are being emphasized; not necessarily in repair work, which is the subject; if basic steel is the product that fails in a given part, some better grade of steel should be substituted.

To know what to do it is necessary to take into account the qualities of the product failing, that better products may be substituted if any

there are to be had. *A suspension bridge* of lead wire would not hold at all. Increasing the amount of lead would not solve the problem. *Use better material* for the purpose.

It is not to damn lead for its failure, it is to censure the user there for his lack of judgment! A great many people do not seem to see things in this way, but the users of automobiles do not see wherein it is for them to foot the bill if there is a basic mistake in its selection.

Nickel Steel and Its Peculiar Characteristics.

Fig. 2 shows a micro-photograph of a specimen of nickel steel, the data of which is as follows:

Magnifications.....	350
Etched.....	Deep.
Condition.....	Normal
Metalloids.....	Low
Carbon.....	.012
Process.....	Basic
Structure.....	Open

Surely, it would be a great mistake to pay ten cents per pound for such a product as this micro-photograph depicts. It has the name, but that is all. This is the class of steel that gives to the *genus*, nickel steel, the reputation it seems to labor under. True, this steel would be improved in appearance by *heat treatment*; equally true, a better grade of nickel steel would show far more improvement as a result of heat treatment. It is no license to use an inferior product, merely because heat treatment *might* mitigate against the evils of its composition, or the manner of its fabrication.

FIG. 3.

The fact that the metalloids are low is no criterion, since the ores of which steel is made are of the very inferior grades. If a part in a car fails, and it is of nickel steel, it may be of the grade of the same as here depicted; in which event it would scarcely be necessary to depart from the use of nickel steel in the replacement, if the replacement is of nickel steel of a truly good quality. Fig. 3 shows still another specimen of nickel steel, the data of which is as follows:

Magnifications.....	350
Etched.....	Medium
Condition.....	Annealed at 800° C.
Metalloids.....	Low
Carbon.....	28 points
Vanadium.....	0.18%
Chromium.....	1.00%
Process.....	Basic
Structure.....	Open

Crankshafts of such steel might be advertised as of nickel steel, but if they fail to thrive in service the repair man will be justified in looking about in quest of a better grade of nickel steel, rather than to conclude that nickel steel will not serve the purpose.

As to the Failure of Nickel Steel.

If the parts are of nickel steel, and the quality of the same is such as to warrant one in pronouncing it *standard*, then failure in service, under normal conditions, would indicate that a different *genera* of steel should be used in the repair. Unless, perchance, the original product was injured in treatment, or not treated at all. If it is plain that the nickel steel would only

FIG. 4.

end in further trouble, later on the only thing to do is to change to a grade of steel of improved characteristics. The next choice might be vanadium chrome steel; if by some means the same could be had of an assured quality. This is not a matter of certainty, because this class of steel is very new, little understood, in dispute, as to its relative virtues, and frequently the fabric of the basic open-hearth process. At all events, it will be well to see in a comparative way what such steel looks like, with a view to which the micro-photographs are here given. The first will be Fig. 4, the data of which is as follows:

Magnifications.....	350
Etched.....	Deep
Condition.....	Over heated
Metalloids.....	Low
Carbon.....	28 points
Vanadium.....	0.18%
Chromium.....	1.00%
Process.....	Basic
Structure.....	Crystalline

It would hardly be possible to find a piece of steel that would be worse for use in any part of an automobile than the steel in the condition as here depicted. It could be pointed out that the specimen was overheated, *on purpose*, to be able to observe its micro-structure; it can also be said it might not be easy to avoid this structure in practice. Fig. 5 is another vanadium chrome steel specimen, the data of which is as follows:

FIG. 5.

Magnifications.....	50
Etched.....	Light
Condition.....	Annealed at 800° C.
Metalloids.....	Low
Carbon.....	28 points
Vanadium.....	0.18%
Chromium.....	1.00%
Process.....	Basic
Structure.....	Uniform

To be able to observe the difference as between viewing the structure at low magnification and with the higher magnifications, Fig. 6 is given of the same grade of steel but with the higher power. Data of Fig. 6 (higher magnifications than Fig. 5):

FIG. 6.

Magnifications.....	250
Etched.....	Light to medium
Condition.....	Annealed at 800° C.
Metalloids.....	Low
Carbon.....	28 points
Vanadium.....	0.18%
Chromium.....	1.00%
Process.....	Basic
Structure.....	Uniform

Since the structure is more plain at 250 diameters than at 50 diameters, it might be argued that to increase the magnifications to a very large extent would be beneficial; this is not necessarily true, since the detail is lost. Later on the author will show to what extent this may be so.

The degree of etching is a matter of some considerable moment that must not be overlooked, for if the etching is deep the appearance of the structure will not be the same as if the etching is light. Fig. 7 is given of the same steel, with a deep etching, and slightly greater magnifications, as follows:

FIG. 7.

Magnifications.....	350
Etching.....	Deep
Condition.....	Annealed at 800° C.
Metalloids.....	Low
Carbon.....	28 points
Vanadium.....	0.18%
Chromium.....	1.00%
Process.....	Basic
Structure.....	Uniform

(To be continued.)

HOW THE AUTOMOBILE CHEAPENS DELIVERY SERVICE

COMPARATIVE cost is undoubtedly the deciding point in any change from horse-drawn to motor delivery services. Business houses generally in all large and growing cities acknowledge the inadequacy of horse-drawn vehicles, and have to admit that at times of greatest stress the horse is least able to perform what is required of it. Two main difficulties have stood in the way of any changes, the first being the want of experience in the new field and the lack of accurate figures regarding cost of operation and upkeep of motor vehicles, and the second the lack of trained drivers at a marketable price. Users of horse vehicles know, or imagine they know, how much it costs to deliver goods by horse vehicles, but are utterly uninformed as to the cost by means of mechanical vehicles. Those who have made the experiment and have the cost of mechanical transportation at their finger tips in the majority of cases show no disposition to communicate them for the benefit of prospective users.

"We have an average of five letters a day," said the head of one large firm using motor vehicles exclusively, "all asking for figures on the cost of operation of our cars. It is impossible for us to reply to them all, and we have made it a rule to ignore every request. Besides, we have done the experimenting, taken whatever risk there was to be taken in the early days, and consider we have a claim to all the benefits."

If pushed back to hard facts and plain figures, it is generally found that the liveryman's knowledge of cost per mile is far from being as exact as would be expected after years of experience. While keeping close watch on all matters of expenditure and conducting his business as scientifically as the majority of those devoting their activities to the search for dollars, few business firms delivering goods by horse-drawn vehicles can state exactly how much they are paying per ton mile to deliver their products to customers.

Some figures in this connection which, though not showing the actual cost per mile, reveal the comparative cost of horse and automobile delivery service, have been obtained in actual use by the Logan Construction Company, of Chillicothe, O. For four successive days in November one of their air-cooled delivery wagons was substituted for the horse-driven force of a large business house and close watch kept of its expenditure.

On the first day the 20-horsepower air-cooled delivery wagon, with a rating of 1,500 pounds paying load and a pos-

sible speed of 15 miles an hour, replaced three wagons and delivered 210 parcels in a time of three hours. Fuel consumption was three gallons of gasoline and 1 1-2 pints of oil. Three wagons were displaced on the second day, and 155 parcels were delivered in 3 hours 45 minutes, with a consumption of 3 1-2 gallons of gasoline and 2 pints of oil. On the third day four wagons were displaced, and 439 parcels delivered in a total time of 4 hours and 45 minutes. Four and a half gallons of gasoline and 2 pints of oil were consumed on this day. On the fourth day four wagons were again displaced, 270 parcels delivered in 9 hours 15 minutes on a consumption of 9 gallons of gasoline and 2 pints of oil. This gives a total for the four days of 981 parcels, delivered in 20 hours 45 minutes, with a total consumption of 20 gallons of gasoline and 7 1-2 pints of oil. A greater initial outlay is called for with a mechanical service than for a horse-drawn force, but even deducting interest for the larger amount of capital invested, the saving is enormously greater for the automobile. Working the experiment out on a month's basis would give the following comparative result:

Cost of one 20-horsepower wagon.....	\$1,800	
Gasoline and oil.....	\$17.82	
Driver's wages.....	60.00	
Battery and repairs.....	6.00	
Tire wear.....	5.00	
	<u>\$88.82</u>	
Cost of three wagons.....	\$450.00	
Cost of three horses.....	450.00	
Harness.....	75.00	
	<u>\$975.00</u>	
Board, stabling and shoeing three horses.....	\$75.00	
Wages of three drivers.....	150.00	
Repairs, etc.....	15.00	
	<u>\$240.00</u>	
Cost of horse service.....	\$240.00	
Cost of automobile service.....	88.82	
Difference in favor of automobile.....	<u>\$151.18</u>	

This comparison of one automobile delivery wagon and its equivalent of three wagons, horses and crews, shows an initial investment of slightly more than double in the case of the former, but this is more than offset by the fact that the running expense under normal conditions would hardly exceed one-third. It must also be taken into consideration that when worked steadily day after day, the provision of three horses would not be sufficient to keep three wagons in constant service. At least four and sometimes five would be necessary, thus increasing their first cost.

THE ADVANTAGES OF USING THE ENGINE AS A BRAKE

By C. F. REDDEN, STUDEBAKER AUTOMOBILE COMPANY.

BRAKING by means of the engine is at times particularly desirable, and it is surprising that more automobilists do not use this method. The regular set of brakes with which a car is equipped are, of course, sufficient to hold it on any decline. Yet, the continued use of the regular brake generates a large amount of heat, which not only wears the brake, but tends to burn it out.

The braking effect of the engine should not be used when it is required to stop suddenly. On a long, gradual descent a certain amount of braking effort is offered by the engine when the electric current is switched off. On a steeper descent the gears should be shifted to either low or intermediate, and the clutch will gradually let in.

In braking the car by means of the engine the greatest care must be used, and the car itself and the motor should be as nearly at the same speed as possible. The papers have

been filled with numbers of accidents, in which the cars have been reported to have gotten away. I have traveled, I believe, in my Studebaker over some of the worst and hilliest country roads in Westchester county, and I often take the precaution to shift into low speed before descending any particularly steep or dangerous hill.

Authorities seem to differ somewhat on what causes this braking effect, but the logical supposition is that it is caused by the compression of the gases in the cylinders. However this may be, the careful use of the engine as a brake is certainly to be encouraged. It has the good practical advantages of saving your own brakes for emergencies and sudden stops, and gives the motor time to stop and cool off, and all this is of considerable importance to the man who is trying to get the most out of his car. This not only means less expense, but less time in the hands of the repairman.

CONCERNING GYROSCOPIC ACTION OF FLYWHEEL—A REPLY

By E. F. McNUTT.

ON page 75 of the January 16 issue of *THE AUTOMOBILE* appears an article by Rodger B. Whitman, entitled, "The Gyroscopic Action of a Flywheel," which sets forth the effects which such action has on the behavior of an automobile. While Mr. Whitman supports his claims by very substantial and convincing proofs, the conclusions which he draws from these proofs are not always entirely correct, nor does he take into consideration all of the factors which enter into the case.

Before taking up the discussion it would be well to state those two well-known laws which, as Mr. Whitman says, govern the gyroscopic action of a rotating body:

1.—If a rotating body be moved along an arc of a great circle, the axis of the rotating body will tend to revolve and assume a position parallel to the axis of the great circle and perpendicular to its plane of rotation.

2.—The axis will tend to assume a position such that the direction of rotation of the body will be the same as that of the great circle in which it is moved.

These laws have been proved by experiments and are beyond question. Taking up, then, the gyroscopic action of an automobile flywheel and its resulting influence on the action of the car, we will assume the average high-powered automobile, with its engine forward, its crankshaft horizontal and lengthwise of the car, and its flywheel turning over towards the left.

Taking first this car on a short, horizontal turn toward the left (which is the direction in which nearly all of the circular track races are run), let us see just what would be the result of the gyroscopic action of the flywheel. We have then in the flywheel a rotating body moved in an arc of a horizontal great circle, counter clockwise; by Law 1, as stated above, the axis of the flywheel will tend to assume a position perpendicular to this horizontal plane of rotation; and by Law 2 the position which it will tend to assume will be such that the flywheel will also rotate counter clockwise, tending to lift the rear wheels and thus destroying their traction. As Mr. Whitman says, such action in the case of a racing machine with a heavy flywheel, taking a sharp turn at high speed, might well result in a force which the weight of the machine could not hold in check; and besides this there are two other forces which tend towards the same effect. Mr. Whitman says: "Attempts to explain accidents to racing cars while rounding turns are often based on the assumption that the gyroscopic tendency of the flywheel will be to roll the car over, but that this is not the case may be deduced from the fact that a car rolling over sideways will be rotating in a vertical plane about a horizontal axis, and that as the axis of the flywheel is horizontal, *it will remain in this position rather than tend to change it.*" That

this is not true in this case may be very easily shown. The rolling of the car due to the effects of centrifugal force would be over towards the outside of the curve, and the plane of this rotation would be vertical and transverse of the car. The flywheel would then tend to assume a position such that its axis would be perpendicular to this plane of rotation, and its direction of rotation the same as that of the rolling of the car, thus exactly reversing the position of its axis; and as the axis might rotate in either direction in a vertical plane parallel to the length of the car in order to assume this position, it would choose that of the least resistance, which would be that direction (over towards the front of the car) in which it tends to move, due to the horizontal turning of the car as explained above, thus adding to the force tending to lift the rear wheels from the ground; also this rolling, for obvious reasons, would concentrate the weight of the car on the two outer wheels, and through the forward motion of the car, partially arrested by the turning moment, most particularly on the outer front wheel.

So far I have agreed with Mr. Whitman that the real cause of accident to racing cars is due to loss of traction, and its resulting dangers, caused by the gyroscopic action of the flywheel; but now let us take the same car turning towards the right. The plane of rotation of the great circle would be horizontal and its direction of rotation would be clockwise, so that the flywheel would tend to assume a position with its axis vertical and its direction of rotation also clockwise, thus having a tendency to lift the front end of the car. But the effects of centrifugal force will also be felt here, and in this case they will oppose the tendency to lift the front wheels. The rolling of the car would be over towards the outside of the curve and in a plane transverse to the car so that the axis of the flywheel would be perpendicular to this plane, and the direction of rotation of the flywheel would be the same as that of the great circle, so that the flywheel would resist this force due to the turning of the car and would tend to maintain its position, thus tending to hold the car level, as would also be the result of the tendency to concentrate the weight of the car on the outer front wheel, the combined effect of these two forces being more than enough to counteract the tendency of the flywheel to raise the front end of the car.

Such, then, is the true explanation of the gyroscopic tendencies of an automobile flywheel and its resulting effects on the movements of the car. It is obvious that if races on circular tracks were run in a clockwise direction instead of following the horse, whose anatomy is equally efficient in either direction, around the track clockwise, many "unavoidable" accidents would be avoided and a much higher rate of speed maintained.

SOME OF THE DEFECTS OF AUTOMOBILE SALESMANSHIP

By ERNEST COLER.

THE rapid development of the automobile industry no doubt is responsible for the present-day inefficiency of automobile salesmanship in that the dissemination of automobile knowledge, by the trade press and otherwise, has overtaken the educational process by which competent automobile salesmen are, or should be, made.

This is not a kind statement, to be sure, but it is based upon facts that should be clearly recognized so that they may be taken as a starting point from which wholesome reform is to proceed. A short time ago I had occasion to

discuss automobile selling methods with a friend, a mechanical engineer of keen observation and an experience including other fields besides that of the automobile, and the comments made by him brought automobile selling in so strong and unfavorable a contrast to the methods employed in standard engineering fields that the writer decided to make a close investigation, the results of which are given in the present article.

Were an acute observer to go down to New York's engineering district—Cortlandt or Liberty street—and then come

up to Gasoline Row on Broadway, he would discover the first distinction in the personnel of the selling force. The automobile salesman seems to be recruited from God knows where; his comprehension of the merits, and especially of the demerits of the product entrusted to his tender care, is hazy; his arguments for or against types of clutches, three or four-point suspension, shaft or chain drive, alloy steels, two or four-cycle, high or low-tension ignition systems, etc., have no depth, are meaningless, being hearsay arguments, devoid of actual knowledge. His superficial command of the demerits of his line renders him unable to meet properly the strictures made by the prospective customer, and he must, therefore, forego the opportunity to turn the weak points into apparent strong advantages.

Recruited from doubtful sources, how rarely does our automobile salesman attempt to strengthen his knowledge and fortify his position by close study of the standard literature and the leading periodicals of the trade? He glances over the pages, dallies over race meets, only when the day is stormy, when he is filled with ennui, tired of matching coins, flirting with the typewriter or running up the telephone bill. The repair shop, where he can learn things better than anywhere, he visits only in case of dire necessity; the mechanic in overalls is uncouth, therefore he has little dealing with him. The car itself on the streets only suggests joy rides, and the business is "the game."

Let us take a look at our cousin, the machinery salesman. It will do us good. He is an engineering-school graduate, perchance a graduate from the firm's draughting room, or a particularly keen mechanic, caught young and educated by the firm for its selling force. The salesman meets you with a slide rule; he has stacks of blueprints which *he can read*. You come there in search of a certain machine to do certain work. At first it seems that what you want is something special; but after studying your requirements the salesman educates you in his product; he will show you that his machine will do your work as you want it, but perhaps in a slightly different manner than you had anticipated. In the engineering field the purchaser is generally represented by his chief engineer, or by the master mechanic, and the salesman is actually instructing experts such as these. This selling system is the same for steam engines, pumps, gas engines, electric machinery, tools, etc. Imagine the high-salaried superintendent of a large machine works going to Liberty street to purchase certain machine tools, and have the salesman point out to him something quicker, more accurate, or cheaper, actually reviewing the operations gone through in the superintendent's factory to produce a given result, and then he will show him how in his own product a slight variation is more advantageous in results.

What would it be called in the automobile field if the sales manager were suddenly called upon to assume the position of chief engineer, as recently happened in a large hydraulic works; if the manager of a distant sales branch were called to the factory, to be the chief draughtsman, as in a big refrigerating-machinery plant; or if the chief inspector were sent to a Southern city to open and conduct a branch office.

as happened in a large gas-engine company but recently?

A statement was made a short time ago by a New England concern that this firm considered as its business the building of high-grade machinery, the body and furnishings to be considered auxiliary and to be adapted as much as possible to suit the ideas of the customer. Such a statement places the firm in the proper light, and were the selling force organized along similar lines this firm would be in the same class as builders of other engineering products.

The one example is the direct antithesis of the other. The engineering salesman knuckles down to be superior in specialized technical knowledge to his customer; if the latter is the purchaser of the backbone of the automobile trade, the great medium-priced car, he digs into its literature, subscribes to a couple of magazines, reads and digests them. In case of the high-priced machine, the chauffeur is consulted, and the (our) salesman keeps mum.

Will this state of affairs continue? Two causes will combine to change it—first, the increasing keenness of competition coupled with the growing automobile knowledge of the public; and, second—stronger than the first—the influx of the commercial vehicle. The first cause will operate by virtue of the fact that automobiles are approaching one another very closely in appearance, in reliability and in price. Purchasers no longer are falling all over themselves to get a car of some kind, satisfied if it has four wheels and some brass work; they demand that not only one trip but dozens of them be made without the necessity for adjustments, whereas, in the old days a trip without some mishap was unheard of. The commercial vehicle will demand a change because the purchaser will be represented by the superintendent of transportation, the chief engineer, or by a consulting engineer. Records will be kept of the car's performance, item by item; styles, fads and fancies, in ignition, transmission, etc., will play no part. Duplicate orders will be given only for cars that have stood the test, probably without even a visit to the salesroom. The argument likely to be advanced, that a certain system is popular in pleasure service will have little value for the commercial vehicle. Here our salesman will have to meet the quizzing of experts; any attempt to sidestep their questions will justly be frowned upon; not only will the purchaser be unfavorably impressed, but the engineering department will develop a tall-sized grouch if an attempt be made to pester it with the real work of the sales department—and pestered it will be if the commercial vehicle business ever becomes brisk. Then technical men will be detached from the engineering force to join the sales department. They will follow the performance of the vehicle *after* it is sold; they will come into close contact with the snags and difficulties of the service; they will analyze the successes and failures of certain features of their own as well as of other products. When, therefore, a new model is developed in the draughting room they will be called upon to go over the details, exactly as is done in other engineering works, with the result that the new model will have advantages that are absent in the machine not produced under such conditions.

FARM HORSE GIVING WAY TO ITS RIVAL, THE AUTO

WASHINGTON, D. C., Feb. 17.—According to investigations made by G. K. Holmes, chief of the Division of Foreign Markets of the Department of Agriculture, the automobile has been responsible for the displacement of but 60,000 horses in this country up to the present time, and farm horses have never been in such great demand as at the present moment. In fact, the demand for horses for farm and other business uses has become stronger and stronger during

the past two or three years, the farm horses alone in use on January 1, 1908, numbering no less than 19,992,000 in round numbers. The department figures that 60,000 horses in stock on farms could have replaced the same number that have given way to the automobile, while it is calculated that the 500,000 horses which electricity displaced in urban street-car service, could have been replaced by 850,000 horses in stock assuming its growth to present proportions with horses.

LETTERS INTERESTING AND INSTRUCTIVE

ALCOHOL OR KEROSENE IN EMERGENCIES.

Editor THE AUTOMOBILE:

[1,168.]—Kindly let me know, through "Letters Interesting and Instructive," how a gasoline car could be run on alcohol or coal oil. Last Sunday I was stuck for want of gasoline, but could have had coal oil or alcohol, but did not know how to use it.

Philadelphia, Pa.

H. R. McKAY.

Either kerosene or alcohol may be used in a gasoline motor in an emergency with but little difficulty. This is the case particularly when the lack of gasoline is discovered before the motor has been allowed to get cold. The emergency fuel may be poured into the tank and the motor, either kept running continuously or started with but little trouble. It is advisable to cover part of the radiator or cut down the efficiency of the cooling system in some equally simple manner in order to raise the temperature of the jacket water and maintain it just short of the boiling point. Otherwise there will be a noticeable lack of power with either alcohol or kerosene. For starting from cold, it will doubtless be found necessary to warm the carbureter by swathing it in rags dipped in boiling water, as neither of the fuels in question will vaporize at ordinary temperatures. It will also be found necessary to increase the amount of lubricant employed to run the same distance, owing to the fact of the introduction of a greater or less quantity of liquid fuel into the cylinder, and the consequent cutting of the film of lubricant on the cylinder walls. Considerably more fuel will be necessary with either of these fuels than with gasoline, and even under the best conditions obtainable with a car on the road it will scarcely be found possible to get as much power as with gasoline; but by heating the carbureter and raising the running temperature considerably, it should always be possible to get home.

DIRECTIONS FOR ADJUSTING A CARBURETER.

Editor THE AUTOMOBILE:

[1,169.]—Will you kindly inform me through the columns of "The Automobile" if my system of adjusting a carbureter that has been completely taken apart would be best, and if not, please advise me: To adjust carbureter, close throttle and retard spark, then adjust gasoline needle till engine regains its highest speed; after this, open throttle with spark still retarded and adjust air valve till the best result from the open throttle is obtained.

Worcester, N. Y.

OMER SLOAT.

We believe it is the consensus of opinion of both carbureter makers and repairmen that the correct method of making a carbureter adjustment of this kind is to regulate the gasoline supply until the motor can be started on it. Then with the motor running, the gasoline is decreased until the motor reaches the lowest speed at which it will run regularly and without missing, the occurrence of the spark being retarded to suit the speed of the motor. The throttle should then be opened and the spark advanced with it, and if the motor fails to run as it should at the higher speeds, an attempt should be made to remedy matters by altering the auxiliary air adjustment so as to allow more or less additional air as the case seems to demand. This method of adjusting is followed on the theory that with a sufficient supply of fuel at low speeds the increased suction of the motor will take care of this essential as the speed increases, and a good mixture will be formed if the air adjustment is correctly made. Probably many autoists have adopted satisfactory methods of their own by doing this, as a result of experience, and their way of accomplishing this most important of adjustments would doubtless be of considerable interest to the rest of their fellows not so fortunately situated, so that we should like to hear from those who have methods of their own, which will be published in this department.

EXAMINING SECOND-HAND CAR CRITICALLY.

Editor THE AUTOMOBILE:

[1,170.]—Will you give in an early issue of "The Automobile" instructions as to how to examine a second-hand automobile (besides a demonstration), which will enable one of moderate mechanical ability to detect weak points likely to soon need repair and determine truly the general condition of the car, and especially of the mechanism and tires; in other words, guiding advice to prospective purchasers of second-hand cars.

Does an air-cooled motor consume more lubricating oil than same size of water-cooled motor, having the same number of cylinders? If so, is there much difference, and to what cause is it due?

A. C.

Pleasant Lake, Ind.

In the purchase of a car that has seen service there are a great many things to be taken into consideration, so that they can only be dwelt upon briefly here. Have the engine run at all speeds while standing and note carefully whether it gives audible sounds of derangement, such as knocking, missing and other miscellaneous sounds of loose or badly worn moving parts, or visible signs of distress such as the escape of smoke from exhaust manifold, water, oil, or gasoline leaks. Many of these may proceed from causes small in themselves, but requiring considerable work to overhaul and make good when taken in the aggregate. A bad knock may only mean lack of adjustment of the bearings, but it is more apt to indicate the necessity of their renewal. A water leak may come from the radiator and prove expensive to repair, and escaping smoke may really come from a cracked valve-port instead of the manifold. The former would be a serious defect, while the latter would only require new asbestos gaskets to remedy. Gasoline and oil leaks may likewise be either trivial or serious according to their cause. The outside appearance of the car should be noted, as this will give some indication of the manner in which its owner has treated it. If it should show the marks of numerous collisions on fenders, hubs and other protruding parts, it is safe to say that it has been recklessly driven and probably not any better taken care of.

After satisfying yourself that there is nothing seriously wrong about the motor or any of its accessories, examine the transmission, step by step. First, the clutch. If this be of the leather-faced conical type, the need for a new facing is not a serious defect, but as many early clutches of this type were poorly designed, it should be looked into thoroughly. Note whether the leather is burned, whether excessive spring pressure is required to seat the clutch, and whether the clutch shaft appears to be in any way sprung, or out of alignment. Open the gear-box and flush the pinions a bit with gasoline so as to be able to observe the condition of their teeth. Mangled and battered gears are a sign of poor material, poor driving, or both, and as they are expensive to replace, a car on which this defect is prominent would not be an extra good investment. Both the clutch and gear-set in the average car are quite accessible, and no owner who honestly believes his car to be in good condition can possibly object to a thorough examination of these vital parts. See that the shafts are absolutely true, and to do this run the motor with the gear-box open. If the shafts wobble, they are not in line, and their bearings should be examined. Stop the motor and try shifting the gears to each position; the cause of any difficulty in doing this should be ascertained before going further.

It will be found a good idea to take a pad and pencil, and as each defect is found, make a note of it, totalling them at the conclusion of the examination and estimating the cost of making them good. The owner will, of course, belittle them in every instance, and assure the prospective purchaser that

they can be made good for a mere nothing—"a few dollars will do the whole thing;" but if the purchaser be not able to estimate the repairs himself, he should take not alone the advice of a repairman, but get a close estimate of what the latter will do the work for. It is well to call in a disinterested repairman. Coming back to the examination, see that the gear-set housing does not leak oil, and that the aluminum is not cracked around the bearing seats. Proceeding further, see that the universals on a shaft-driven car are not badly worn. Look to the chains on a car of that type, also the sprockets. Jack up the rear axle, open the differential case—there is usually a hand-hole plate easily removable, so do not be deterred from examining such parts through the disinclination of the seller to show them "on account of the trouble." Have some one turn the rear wheels for you while you watch the differential pinions and the main bevel and driving bevel pinions for wear or broken teeth. With both rear wheels jacked up, run the motor and try shifting the gears to every speed, including the reverse. Note the running of the differential, and then stand off to the rear and note how the rear wheels run. If they wobble at all, and weakness of the rear-axle driving unit has been a characteristic of many low-priced cars during the past few years, it is an indication that the driving shafts of the rear-axle are sprung, the differential is out of line or something of that nature—in any event, an expensive item to make good.

Examine the axles closely for dents or other indications of the effects of a collision, and look closely into the manner in which the springs have stood up. If they have been overburdened and have taken an excessive permanent set, they are apt to break at any time. Comparing their appearance with those of a new car is probably the easiest method for a layman to detect anything wrong with their appearance. Look into the steering closely—some looseness is inevitable, but there should not be an amount of play that would render it dangerous as being apt to give way at any moment. Also examine all steering gear connections minutely, particularly the drag-link. Take hold of the wheels and try to shake them laterally to detect looseness on their bearings. No matter how close this examination has been, insist upon having a long demonstration. Many cars can be made to run around the block or for a mile or two, without revealing anything wrong, but they are apt to prove their real condition on a good day's run. It will be found a good investment to offer to pay for the fuel and other expenses of making such a demonstration, whether the sale be consummated or not. Any owner will realize the justice of such a proposal.

An air-cooled motor consumes more lubricating oil than a water-cooled type, due to the higher average temperature of operation. The difference depends entirely upon the make of the two motors. The accusation has been made against some air-cooled motors that they are "oil-cooled," but ordinarily the difference in this respect is not great enough to be put down as a disadvantage.

LIQUID GASOLINE IN THE MANIFOLD.

Editor THE AUTOMOBILE:

[1,171.]—Will you kindly explain, in the columns of your paper, why liquid gasoline can be seen swimming down the pipe that leads from the carbureter to the intake pipe on my four-cylinder, 30-horsepower car, fitted with a Schebler carbureter? Is there any way of adjusting the float on said carbureter? If so, where?
Colon, Neb.

A SUBSCRIBER.

It is evident that either the float is too high or the opening of the nozzle is too great for the requirements of the motor, or it may be that both troubles are present. Theoretically, liquid gasoline should never get beyond the carbureter and into the intake manifold, though under certain conditions more or less either finds its way there or becomes transformed into that form by condensation, but any such amount of liquid that would justify the term "swimming," would seem

to point to very defective adjustment. If you will write the makers of the Schebler carbureter they will forward you a comprehensive book of instructions on its use and adjustment, which will serve your purpose much better than the necessarily limited amount of space that could be devoted to it here. Such a book takes up each part of the carbureter, describing it and its functions in detail, and exactly the manner of making all the adjustments.

TO THE AID OF TWO INQUIRERS.

Editor THE AUTOMOBILE:

[1,172.]—In your publication of December 30, I notice a communication, No. 1,136, signed "A Subscriber, Oakland, Cal.," who complains of trouble which he had relative to his machine, which was a four-cylinder engine with automatic intake valves, knocking when under load.

I have had some difficulty with the same style of machine, using a Schebler carbureter, and, I imagine from his description, the same engine.

After exhausting every method to locate the cause of trouble, I have succeeded in obviating the entire difficulty by changing the carbureter. I believe the Schebler carbureter is a remarkably good one, but possibly not adapted to some styles of engines as well as a larger carbureter, and if you will take the trouble to forward to the writer of the inquiry this communication I shall be pleased to advise him the methods which I followed in locating the trouble and correcting it.

I would also say in reply to inquiry No. 1,142, of February 6, by J. H. Townsend, of Danbury, Conn., I have advised him that the Buckmobile was manufactured in Utica, N. Y., and the concern manufacturing it has been out of business for some time, but I am also advised that parts may be purchased from some person in Syracuse, N. Y., the exact location of which I shall be pleased to ascertain should other inquiries follow.
J. T. DURHAM.
Onelda, N. Y.

Editor THE AUTOMOBILE:

[1,173.]—I notice in your issue of February 6 an inquiry, No. 1,142, signed J. Townsend, Danbury, Conn., who wants to know who built the Buckmobile. You answered his inquiry by saying that you didn't know their address. The Buckmobile was built in Utica, N. Y., by the Black Diamond Automobile Company, and the factory was located on Upper Genesee street. The company is now out of business, but the people interested are Mr. Brower, William Birdsall, now with the Mora Motor Car Company, and A. J. Seaton. Mr. Seaton and Mr. Brower are still in Utica.

IMPERIAL MOTOR CAR COMPANY,

Williamsport, Pa. Fred P. Brand, Vice-Pres. and Gen. Mgr.

The following have also come to the rescue of Mr. Townsend on the Buckmobile question, but as their letters contain the same information in greater or less detail, it is unnecessary to publish them here in full. They are:

- Philip A. Clum, Clum & Atkinson, Rochester, N. Y.
- C. B. Hine, Curtis & Hinc, Colorado Springs, Col.
- D. C. Austin, Newark, N. J.

CONCERNING THE TIMING OF A MAGNETO.

Editor THE AUTOMOBILE:

[1,174.]—Kindly advise me if possible, as to the dates of the various publications of your paper which have technical articles bearing upon the action and construction of magnetos. I find that most publications on ignition, while going thoroughly into the question of volts and amperes and Ohm's Law, jump at once to induced and self-induced currents, without proper explanation.

Kindly advise me also on the following points:

1. Why cannot a low-tension magneto giving an output of 6 volts at 1,500 r.p.m. with the aid of an induction coil and trembler, be used on a jump spark? In your issue of December 19, 1907, under the heading, "Why an L. T. Magneto Must Be Timed" (No. 1,025), you say that the magneto generates an alternating current, and must be properly timed by gearing. How does such a magneto differ from an L. T. Hendricks magneto, giving 6 volts at 1,500 r.p.m., with the aid of a primary spark coil, that I am using on a make and break circuit for a three-horsepower, two-cycle engine, the drive being by friction wheel from engine flywheel, and which is certainly not timed?

New York City.

JAMES W. MYER.

In view of what you state in the first part of your inquiry, few of the articles published on the subject of magnetos in

THE AUTOMOBILE would be of any great assistance to you, and we should recommend you to invest in an elementary work on electricity, as you will realize it is out of the question to begin with the rudiments every time it is necessary to explain something of this kind.

Because, at this speed, there would be such an appreciable length of time between the current impulses that it would be quite possible for them to occur between the intervals of spark timing, instead of when wanted, with a consequent failure of ignition. It must be borne in mind that the type of magneto commonly employed for automobile ignition has a simple "H"-shaped armature and a two-pole field, so that it only generates two impulses per revolution, from which it will be evident that it would be necessary to run it at a very much higher rate of speed than 1,500 r. p. m. in order to insure having sufficient current at the proper moment to ignite a high-speed engine. In fact, the number of cycles, or alternations of the current, would have to be almost as high as that used for incandescent lighting, *i. e.*, 65 to 125 per second, so as to obviate the possibility of a dead point of the armature revolution corresponding with the firing point of one of the cylinders. The need for doing this is eliminated by timing the magneto to the engine, thus utilizing its two comparatively widely separated impulses to the best effect.

Such a magneto differs from what you term a magneto altogether, in that the machine you have is really not a magneto at all. It is simply a small direct-current generator with a permanent magnetic field instead of the usual electromagnetic field employed on dynamos. It does not generate an alternating current, but a direct current, and there is no reason why it cannot be used with an induction coil and spark plugs for jump spark work, except that it will be necessary to closely regulate the generator speed on an auto.

QUESTIONS CONCERNING POWER AND TIRES.

Editor THE AUTOMOBILE:

[1,175.]—Will you kindly answer the two following questions through "Letters Interesting and Instructive":

1. I have a Winton Model K and would like to know if I could get more power by mixing kerosene with gasoline, and if so, what is the proportion?

2. Can you tell me how much of a load a 34 by 4 tire should carry?
N. F. R.

1. It might be possible to obtain greater power by using a mixture of kerosene and gasoline, rather than the latter alone, but we doubt if this would be the case where such a mixture is employed in a motor designed primarily to be run on gasoline alone and fitted particularly for that fuel. Kerosene has slightly more heating value than gasoline, but a higher initial compression and a longer stroke are required to fully take advantage of it. You might reduce your fuel bill somewhat by using a mixture of half kerosene and half gasoline, or one-quarter of the first and three-quarters of the latter, but in any case we doubt very much if there would be any appreciable difference in the amount of power developed.

2. The permissible load of 34 by 4-inch tire is 700 pounds per wheel, as agreed upon by the tire manufacturers two years ago. It is needless to add that this is far more often exceeded in practice than otherwise.

WHAT CAUSES THIS MOTOR TO MISS?

Editor THE AUTOMOBILE:

[1,176.]—Will you kindly answer the following questions: Why does my motor miss explosions after starting in the morning until it has run about ten minutes? It is a 50-horsepower four-cylinder engine. Would an induction coil increase the power of the motor with low-tension, make and break ignition?
L. A. H.
Jacksonville, Fla.

Some motors will frequently do this until they have run long enough to warm up. It is probably caused by the fact that either the carbureter is not adjusted to furnish a readily explosive mixture until it becomes warm, or it is incapable of

working well when cold. An induction coil could not be employed in connection with a low-tension system. You may have reference to a common "spark" coil, which is a single winding on a heavy iron core. This will increase the size and intensity of the spark made by a low-tension igniter and might improve matters where the current now obtainable is weak.

BUSINESS METHOD OF FIGURING COSTS.

Editor THE AUTOMOBILE:

[1,177.]—Your "Letters Interesting and Instructive" often chronicle low costs per mile for the operation of the automobile, and it has often occurred to the writer that the reading public may be misled by the figures presented. There is no doubt but what the actual fuel expense and repair costs of upkeep are in some instances very mild, and to those who are fortunate enough to be numbered with the lucky squad the figures tell a very gratifying story.

There may be many others who will agree with the writer in the following schedule of expense, and it would be pleasing to see opinions quoted and compared, at least to the writer, and possibly to other readers of your valuable journal.

Would not a very equitable plan, in figuring the cost of keeping an auto include properly the following expenses:

First.—Interest upon the original investment for the full period of ownership, first cost to include price of all accessories.

Second.—Actual depreciation of the machine, never correctly determined until the machine is sold.

Third.—Stable hire, or garage rent, by the month or other period, for even those of us who own our own stables should pay ourselves rent.

Fourth.—Fire insurance. Is it safe to be without it?

Fifth.—Accident insurance. Apply the same question as above.

Sixth.—Necessary replacements, for no car will run indefinitely without care and renewed parts occasionally.

Seventh.—Shop charges for repairs not soivable to the ordinary mechanic.

And lastly—The, often estimated, quantity of fuel and lubricant used. Does not the last item become really a minor consideration in the keeping of a machine, and would a better standard to go by be the cost per year to run a machine, rather than the cost per mile, for divide all the costs by a low mileage and the result will astonish a driver, while a large mileage would be affected by practically the last item only, other numbers being in the line of fixed charges.

No account has been taken of costs of entertainment, as that should be returned in kind some day, and the writer assumes that an owner who cares to figure the expense drives his own car.

Lawrence, Mass.

A CONSTANT READER.

PAINTING ALUMINUM FOOTBOARDS.

Editor THE AUTOMOBILE:

[1,178.]—I have worked out a kink in the care of a car which I think may prove of interest to fellow automobile users, so I am sending it for publication in "Letters Interesting and Instructive," if you consider it merits a place there. The use of cast aluminum with a roughened surface has become so common for footboards, toeboards, running boards, etc., as to make its maintenance in bright condition somewhat of a problem for the owner who already has enough of trouble in the way of brass to be polished, paint to be washed, etc. When new, the aluminum looks fine, with a satiny finish that appeals to all, but once it has been splashed over a little with oil and then exposed to dust and muddy feet, it is practically impossible to clean it up again to look like new, its roughened and somewhat absorbent surface clinging to the dirt past the ability of any ordinary ingenuity to remove it. Confronted with this condition, I tried the experiment of painting the surfaces with a solid coat of good coach varnish, of a color that harmonized with that of the rest of the car. Then, with a sheet of sandpaper wrapped about a block of wood, I took off all the paint from the smooth edges and high points, leaving these exposed and easily reached portions in bright aluminum, while the less-exposed portions remained coated with the easily washed paint. In the matter of appearance, I consider that the pattern worked out by the alternation of the bright aluminum points and edges with the darker painted areas will appeal quite as generally as the unrelieved aluminum surface.

Houston, Tex.

LEO JOELSON, M.D.

ABOUT HIGH-TENSION IGNITION VOLTAGE.

Editor THE AUTOMOBILE:

[1,179.]—In question No. 1,029, Mr. Ellis wishes to know at what voltage the spark is given in the cylinder. The question seems to be of considerable interest to many. I have heard as many different

answers as questions, and the answers run from 10,000 to 100,000 volts, the last from your magazine. As we cannot get something from nothing, let us look to our supply of electricity for this excessive voltage. If we had 10 amperes of electricity at 1 volt, we could transform it with a suitable induction coil to one ampere at 10 volts or 1-2 ampere at 20 volts. What we gain in voltage or pressure of current we lose in amperage or quality. Now we know that we can take 6 cells that show 4 amperes each, and by connecting them in series we get approximately 9 volts, but this gives a total amperage for the 6 cells of 4 amperes. Now, if we should transform these 4 amperes to 100,000 volts, this would give us but 1-25,000 of an ampere to make a continued spark for a minute or so, as these six cells will do in actual operation.

As an ampere represents a volume of a current produced by a pressure of one volt, flowing through a conductor having a resistance of one ohm, the above current could only pass through a wire having the resistance of 1-25,000 of an ohm. There is only one way to find the truth of this matter, and that is to get a coil maker to tell us what are the proportions in his windings in the primary and secondary coils, and then we could figure it out ourselves.

I want to say a word in regard to Mr. Fay's assertion that a carbureter should not have a needle point in the spray nozzle. For the last three years I have never adjusted my carbureter, for the simple reason that I couldn't if I wanted to, as there is no needle point in the nozzle, and if all parts of my automobile were as perfect as this one part, all would go well indeed. I think a carbureter with a needle point would be on par with a man buying boots too large and then pulling on three or four pairs of stockings to make them fit.

FRED C. HATHAWAY.

Portland, Mich.

TIMING AND SCAVENGING AT HIGH SPEEDS.

Editor THE AUTOMOBILE:

[1,180.]—Referring to the final paragraph of C. T. Bates' letter, in your issue of February 6, I venture to say that if Mr. Bates will read again what I said about spark timing at high speeds, and read it slowly, he will fail to find any intimation that complete ignition of the mixture can be obtained at the instant which would give maximum effect, when running at very high speeds. What I said was that timing the spark is no more difficult at high than at low speeds, and I was careful to explain that beyond a certain speed it is not practicable to advance the timing far enough to secure combustion at the most efficient moment. The most efficient timing is not practicable simply because it entails beginning combustion so far ahead of the dead center position as to produce dangerous back pressures, and not because of any difficulty in setting the timer at the proper point, as Mr. Fay's statement clearly intimated.

In my letter, on page 181 of your issue of February 6, a line is omitted and the effect of a statement thereby impaired. After the fifth line from the top of the second column should be inserted the line:

"but this critical point usually occurs near or beyond the maximum speed."

CECIL P. POOLE.

New York City.

HELP ON THE LUBRICATION QUESTION.

Editor THE AUTOMOBILE:

[1,181.]—I have obtained a great deal of useful and helpful information in your "Letters Interesting and Instructive," and as one good turn deserves another, I will give my experience with a Ford Model N runabout. Formerly I had lots of trouble with my spark plugs sooting up. I frequently cleaned one or more plugs two or three times a day. I don't do that any more—do not have to—have not looked at a plug for the past three months. Let me explain: I now pour kerosene, lubricating oil, either or both, in any quantities from a pint to a couple of quarts of cylinder oil, right into the crankcase, but when I have done that I also pour a cupful—4 to 6 ounces—of "radium decarbonizer" right into the crankcase, start up the engine, and away I go, with never a miss from foul plugs. My muffler I find to be clean and the engine with splendid compression and increased power. This is in no way an "ad" for anybody. I pay for what I get, and I only write these lines for the benefit of others, who, like myself, are afraid to pour oil freely into the case. Now I do as Ford says, pour in plenty oil, and then some more, and then lots of oil; no matter how she smokes, the plugs will stay clean.

J. L. WILLIAMSON, M.D.

Milwaukee, Wis.

INFORMATION WANTED ABOUT "MAGNALIUM."

Editor THE AUTOMOBILE:

[1,182.]—On several occasions recently I have come across references in different trade papers to an alloy termed "magnallium." It is, as I understand, an alloy of aluminum and magnesium, and is, because of the specific gravity of the second component, even lighter than aluminum, while it is claimed to possess altogether

superior physical properties. I do not know that it is extensively applied to any purpose, except for making beams for fine analytical balances, and it is apparently so new that I am able to secure only the most meager information concerning it. For this reason I am writing to learn what I can about its physical properties, etc. I will greatly appreciate it if you can tell me by whom and when this alloy was first used, where it can be secured and the cost, its specific gravity, its tensile strength, character of fracture, melting point, capacity for forming by founding, hammering, and machining, and its appearance and resistance to corrosion. I particularly wish to know about the latter point, because pure magnesium is well known to oxidize quickly to magnesia if exposed to moist air.

Madera, Cal.

GEORGE WAINWRIGHT.

HELPING OUT TWO OTHER INQUIRERS.

Editor THE AUTOMOBILE:

[1,183.]—In answer to Nos. 1,136 and 1,137 of your "Letters Interesting and Instructive," let me give you my answers.

Inquiry No. 1,136: I had the same trouble on my four-cycle engine, and after a great deal of trouble, looking and worrying. I found that the connecting rod was loose at the wrist; i.e., in the piston end of the rod. The questioner will very probably find the same cause for the "knock."

Inquiry No. 1,137: I will say he can use his engine as a brake O. K. with the throttle closed and ignition off. If the descent is too steep, change to a lower gear. If the inquirer will get on a long hill and then cut out the ignition, he can experiment for himself with the throttle; but he will find it as the editor suggests; i.e., keep the throttle closed and save fuel as well as get more braking power out of the engine.

Allegan, Mich.

SCHUYLER G. FOSTER.

NECESSARY TO WARM THE CARBURETER.

Editor THE AUTOMOBILE:

[1,184.]—Regarding letter, No. 1,135 in "Letters Interesting and Instructive," you say there is no need of heating the air or carbureter. There is, and the warmer the air and the warmer the carbureter is kept, the more economical and efficient the engine will be. Why are all the leading carbureter companies water-jacketing their carbureters?

Regarding letter No. 1,136. Have had some trouble with a Louls two-cycle engine, but found it was lack of lubricant. Engine would run fine as long as I kept the oil so high in the crankcase as to cause the engine to smoke. It was a water-cooled engine.

Chicago, Ill.

MORE ABOUT BRAKING WITH THE MOTOR.

Editor THE AUTOMOBILE:

[1,185.]—After reading letter No. 1,137 in your issue of January 30, relative to using motor for braking purposes, it may interest some of your readers to know that a very satisfactory device of this kind can be had in the open market. I have used this device with very gratifying results. It consists of an auxiliary air and ignition cut-out valve located directly under the steering wheel, which when opened admits cold air to the induction pipe ahead of carbureter, and at the same time cuts out the ignition. I have found the saving in one season of fuel, brake bands and batteries amounted to many times the first cost, not to mention the great amount of added comfort and convenience in the handling of the car obtained by the use of the device.

FRANK T. CABLE.

Wollaston, Mass.

ONE WAY OF MAKING DRY CELLS OVER.

Editor THE AUTOMOBILE:

[1,186.]—Where dry batteries retail from 40 to 60 cents, it pays to rejuvenate your old ones. To do so, cut the old zincs off, being careful not to disturb the manganese filling, then wind tightly with two or three layers of blotting paper, then wrap with linen thread to hold in place, then slip a new zinc over, leaving the long joint unsoldered; then wrap this tight with a piece of wire, solder the joints, and take off the wire; then soak it from the top with a strong solution of salammoniac or ammonia chloride and seal, and it has got a new lease of life. This can be done at a trifling expense, and the fillings will stand the operation two or three times.

Redding, Cal.

A BATTERY FIEND.

SOME CORRECTIONS FOR LETTER NO. 1150.

Editor THE AUTOMOBILE:

[1,187.]—Referring to letter No. 1,150 in the issue of January 30, I beg to say that I wrote possible "relations," not "solutions," and "Type 1," not "Type 2."

CHARLES J. WILLIAMS.

East Acton, Mass.

TO SUPPLANT STEAM ON PRAIRIES.

Nothing but the steam traction engine and improved agricultural machinery made the vast farms of the western plains a possibility, but it would seem that the day of the steam tractor is now drawing to a close, and that its place will shortly be taken by the far lighter and more economical gasoline-driven machine. A concern known as the Farmobile Company has devised a special machine to take care of practically all the power needs on these large farms. Its manufacture has been taken up by the Oscar Lear Automobile Company, Springfield, Ohio, and it is probable that the latter firm will build these farm machines in numbers. For plowing and similar work the Farmobile works on a novel principle that insures the efficient utilization of every bit of its power, regardless of the nature of the ground. The machine gets its traction from a 7-16-inch steel cable, stretching the entire length of the field and anchored at one end by means of a pulley block, which rides on a 1-2-inch cable at right angles to the main cable, 200 feet long, and which is anchored to 6-inch posts, set 200 feet apart.

On the machine itself are large drums or capstans, round which the main cable takes six turns, or wraps, and passes out to the rear. These capstans are arranged to be propelled directly by the engine, and when turned in this manner the machine advances along the cable, drawing a load which would require twenty strong horses to haul, and at a speed of 2 1-2 miles an hour. The main cable, riding on the transverse cable at the end of the field, allows of a strip 200 feet wide being worked the entire length of the field without shifting the cable. When such a strip has been completed the end cable is unlooped from the first post and put over a third, and then the machine is in a position to work a second 200-foot trip. Under favorable conditions the machine will plow 12 furrows at a time and will average 35 acres per day of 10 hours. The cable system also provides an ideal method of pulling stumps, lifting very heavy weights, and the like, and with its aid a farm can be worked practically without the use of horses.

It is also designed to be used for traction purposes, and can make a speed of four miles an hour on the road when hauling its maximum load in the shape of a train of wagons.

It is also adapted to be used for cultivating, or the engine can be run free and its power utilized, by means of the large belt pulley provided, to run stationary farm machinery, pumps, or for similar purposes. The power plant consists of a Frayer-Miller air-cooled engine mounted transversely across the frame of the machine, both the ignition and throttle being controlled by a centrifugal governor, so that the driver is left free to watch the steering and tend to the plows, his seat being so placed that he has full control over

SIDE ELEVATION OF THE FARMOBILE, SHOWING ARRANGEMENT OF DRIVING GEAR.

the machine as well as whatever it is hauling. The control of the machine itself is by means of a steering wheel and two levers. Three sizes of the machine are to be built, equipped with 20, 35 and 50 horsepower Frayer-Miller air-cooled motors, respectively. They will weigh in the neighborhood of 3,500 pounds and will sell for approximately \$1,500, \$2,000 and \$2,500. The use of such machines in the western part of the country, with alcohol as a fuel, would provide a great impetus to the further introduction of machinery for farm use, as in such regions the cost of coal, wood and gasoline is practically prohibitive. Since the machine shown by the accompanying photograph, together with its work, was built, the driver's seat has been changed as shown by the line sketch illustrating a Model A Farmobile.

THE FRAYER-MILLER FARMOBILE PULLING FIVE PLOWS IN FROZEN GROUND NOT BROKEN PREVIOUSLY IN 25 YEARS

NOVEL AUTOMATIC GEAR-SHIFTER.

Numerous attempts have been made to solve the problem of lessening the driver's work of gear-shifting, as well as the disadvantages to a great extent, by providing the car with an automatic device to accomplish this end. An ingenious arrangement of this kind has been invented by Thomas Burton Ford, on which a patent has recently been granted. The illustration shows a side elevation of the device as applied to

DETAILS OF CYLINDER AND DIAPHRAGM.

a car, the force employed being compressed air, the action of which is automatically controlled by the speed of the car and of the engine. Two air pumps are provided, one run by the engine and the other by the rear wheel, both being connected with a cylinder and piston, an extension of the piston rod of which carries the shifting element of the gear-set. According as the speed of the motor or that of the rear wheels is greater, the gears

are automatically shifted up or down, as the result of the compressed air being admitted to one side of the piston or the other, thus enabling the motor to run at a uniform speed. The action is controlled by a diaphragm, a dash-pot arrangement, H^a I^s, being provided to prevent sudden operation.

The operation of the device, as described by the inventor, is, in part, as follows:

Assume that the vehicle is going up a hill driving through the low speed gears C², C³. When the level is reached, there being less friction to overcome, the wheels turn faster and throw the intermediate gears C¹, C⁴ into operation. On a further forward movement on the level the speed of the traction wheel is raised by the intermediate gears and the air pump O pumps more air against the diaphragm L^a, so that the valve L^v is moved nearly to a closed position to shut off the pressure in the outer end of the large bore H^v of the cylinder H, so that the preponderance of pressure against the pistons I and I' by way of the branch pipe G² causes a movement of the pistons I and I' toward the left, to move the incline J' of the shifter J in engagement with the clutch pin K of the clutch member C⁴ of the gear wheel C⁴, to connect the latter with the

SHOWING METHOD OF INSTALLATION ON A CAR.

shaft D, and consequently the shaft D is rotated at a high rate of speed from the motor shaft B without increasing the speed of the motor A.

When the resistance increases to a certain extent the traction wheels turn slower, the air pressure against the diaphragm L^a decreases, and the valve L^v opens to admit sufficient pressure to the outer end of the bore H^v of the cylinder H to throw the intermediate gears C¹, C⁴ into operation. On a further increase in the friction, as in going up a hill, the traction wheels E, in rotating slower, force the air pump O to pump less air in a given time against the diaphragm L^a, so that the valve L^v opens wider, and consequently more air passes from the air pump G through the branch pipe G² into the outer end of the large bore H^v, to cause

the piston I and with it the piston I' to be shifted in the direction of the arrow a', whereby the incline J' of the shifter J moves out of engagement with the clutch pin K of the gear wheel C⁴ and moves into engagement with the clutch pin K of the gear wheel C¹ to connect the latter with the shaft B, so that the latter shaft is now rotated from the motor shaft B by way of the gear wheels C¹, C⁴ and the said clutch mechanism. When this takes place, the traction wheels E are driven with more force without change in the normal speed of the motor A.

From the foregoing it will be seen that by the arrangement described the variation of pressure in the outer end of the bore H^v of the cylinder H, is controlled solely from the traction wheels E, and consequently the motor A, is free to run at a predetermined speed, and the motor A can thus operate to its fullest advantage at all times.

NOVEL MACHINE FOR TESTING BALL BEARINGS.

In order to be able to accurately determine the frictional resistance of a bearing as well as its ultimate load-carrying capacity, the Hess-Bright Manufacturing Company, Philadelphia, makers of ball bearings, have devised a most interesting machine. While it is equally adapted to test any form of bearing, whether plain, roller or ball, it has been designed primarily for the latter as a means of maintaining the high standard of the Hess-Bright bearings. This machine will measure the frictional resistance of a ball bearing that is radially loaded up to 15,000 pounds and does this with a factor of error of not more than two per cent. It will also measure the friction incident to a thrust load up to 10,500 pounds and here its accuracy is within .05 per cent. Both these stresses may be applied simultaneously in any desired ratio within the limits given and at speeds ranging from 50 to 2,200 r. p. m.

Hess-Bright ball bearing No. 308 is a size much used in automobile hubs, change speed gears and the like, so that the results of tests it has undergone are of interest. It has a bore of 1.57 inches, a diameter of 3.54 inches and has 8 balls 9-16-inch diameter, kept apart by the elastic separators characteristic of the HB-DWF construction. The radial load was started at 800 pounds and increased to 13,200 pounds by increments of 40 pounds, the test occupying 10 hours running time, the speed corresponding to 24 miles per hour for a 32-inch wheel. The radial load was started at the same point and raised to 11,000 pounds in four and a half hours, at which load it was run for seven and a half hours at 325 r. p. m., or the equivalent of 31 miles an hour in a 32-inch wheel hub. Tests showed the total radial freedom to be .00045 and the total axial freedom .007 inch, both being within the limits of a new bearing and thus showing no appreciable wear. In practice the number 308 bearing is not loaded above 1,000 pounds, so the tests showed it to have more than a tenfold factor of safety.

AERIAL YACHTS NOW A COMMERCIAL FEATURE.

PARIS, Feb. 11.—An indication that the airship has already reached an advanced position in the world of commerce and sport is found in some of the catalogues of balloon makers descriptive of 1908 models of aerial yachts for pleasure and touring. Just to take one of these as an example, two 1908 models are described, a large one for military use, fitted with a couple of 70-horsepower engines, and a smaller pleasure yacht, fitted with a 30-horsepower motor and guaranteed to give twenty miles an hour. The standard models are described in detail much as a manufacturer would describe an automobile or a motorboat, but instead of the pleasures of touring on land or water the joy of being able to cruise in the air is set forth in glowing language. The significant thing about it is that firms having won laurels by the construction of successful Government ships should already have adopted fixed types ready to be delivered from stock. The Bayard-Clément firm is said to be receiving orders for dirigibles, and several other large constructors, including Renault, are building aeronautical engines.

AN EXAMPLE IN PROGRESS THAT TELLS ITS OWN STORY

ANYONE who was anxious to invest in a hansom cab—not of the automobile variety, but of the sort to which a four-legged hay motor is usually attached—should have taken up his stand at Broadway and Forty-second street, New York City, just before 2 A. M. Sunday morning, for they were going cheap. "Not a dollar to-night and no chance," said Dan Buckley, as he watched the crowds leaving the Knickerbocker Hotel, hour after hour, without so much as looking at the line of hansom, now relegated to the background by the new "taxis." Dan is the dean of the nighthawks, those deep-sea cabmen who spurn anything less than a two-dollar bill, no matter how short the ride, and he has cruised throughout the Tenderloin in fair weather and foul for the past twenty-two years. "The days of the nighthawk are over and we might as well give in," he continued. "I'm going to sell my old cab and get out." Thereupon was the hansom buyer's opportunity.

Dan has had six cabs in his long career and they cost as high as \$1,400 apiece, but the impromptu auction held then and there at the curb failed to bring more than \$10 for his last cruiser. "It's all up with us guys. We're all in and down and out. Here goes my old wagon for what you'll pay for it," and with this impromptu speech the bidding was on, the opener being a quarter. The jumps were not much bigger and, there being no offers over \$10, the towering two-wheeler was knocked down to Eddie Poole at that figure. The motive power and its tie ropes were thereupon seized by Charles Crowl as the equivalent of a ten-dollar payment on his stable bill of \$25. Then Bill Lynch, another old-timer, fell in line, followed immediately after-

ward by George Schaefer. Being of more recent vintage, their craft brought \$25 and \$20 respectively, sans power-plant.

In the heyday of his calling, it was nothing unusual for the nighthawk to average \$20 a night, but of late it has been difficult to make that much in a week, and stable charges are higher than ever. The coming of the taxicab has been his undoing, and New York's unsavory institution that has so often been good to the night reporter for a column or more will soon be relegated to the limbo that holds the horse car and the ancient Fifth avenue stage.

No evolution ever proceeded more rapidly and no change was ever made with more silent resignation. The horse driver might have temporarily saved the situation by adopting the taximeter instrument to his vehicle, but his pride would not allow him to climb down from the autocratic position he had held for years, and after a few brief months of struggle with hard times, considerably shortened by reason of a general depression, he has had to get off the box and seek new fields of activity.

In hardly a single instance has the horse driver been able to profit by the good times brought to his trade by the arrival of the taxicab. Under the new system more people travel in cabs than was the case under the old conditions, for, being assured in advance of quick service and honest treatment, there is lesser need to always patronize surface cars and subway. But the young men who knew, or thought they knew, something of automobiles rushed in first and, without any waiting, earned sums that would have satisfied the most rapacious old-time cabby, and made it without robbing the public.

PICTURESQUE SLEEPY HOLLOW CEMETERY WHERE WASHINGTON IRVING IS BURIED. THE CHURCH WAS BUILT IN 1699.

The old graveyard and church figures prominently in Irving's "Legend of Sleepy Hollow." The photograph was taken on the recent run of the Maja car from New York to Poughkeepsie and return in a snowstorm, to see how the vanadium steel springs of the car would withstand the hard roads and rough going. The trip was satisfactory, and Manager E. B. Gallaher also discovered that during the run upwards of 21 miles had been covered for each gallon of fuel used.

GOOD ROADS APOSTLE THATCHER SPEAKING FROM PREMIER.

A GOOD ROADS ADVOCATE AND HIS MASCOT.

Charles W. Thatcher, in a prairie schooner drawn by two small Spanish mules, has crossed the American continent and is now on his way from the Great Lakes to the Gulf, making speeches as he journeys, endeavoring to arouse national enthusiasm so that Federal assistance will be given for the construction of national highways. While in Louisville, Ky., Mr. Thatcher was the guest of the Louisville Automobile Club, and the photograph shows him addressing a street audience from the rear of a Premier Roadster. He utilizes one of the Spanish mules, "Burro," whom he calls his "Good Roads Mascot," as a pulpit from which to expound his good roads gospel.

SALES MANAGER KIRKPATRICK ON THE WEST.

CLEVELAND, O., Feb. 17.—W. H. Kirkpatrick, sales manager for the Peerless Motor Car Company, has returned from a trip West. Mr. Kirkpatrick says that the people in the West are making money fast, and they are willing to spend it in the best. He says the six-cylinder car is meeting with a very favorable reception throughout the western country. W. D. Marlow, agent for the Peerless at Colorado Springs, was a visitor at the Peerless factory last week, and turned in orders for five six-cylinder cars for early delivery, in addition to an order for stock cars. H. B. Clarkson, of Kansas City, was another visitor at the Peerless factory. He looked after the Peerless interests at the recent Kansas City show.

ORIENTAL DIPLOMATS ENJOYING A RIDE IN THE WINTON.

Both Gen. Morteza Kahn, Persian Minister to the United States, and Chekib Bey, the Turkish Minister, are enthusiastic autoists. The former is at the wheel of the "Six-Teen-Six" Winton, and the latter occupies the seat beside him. The photograph was taken in the suburbs of Washington.

ROADS IMPROVING AT TOLEDO FACTORY.

TOLEDO, O., Feb. 17.—"Good roads" is a subject of such absorbing interest in all parts of our country that any information leading to the betterment of our highways is appreciated. Here is a method for road improvement which has been tried out at the Pope-Toledo factory with good results and it is an extremely simple one. On the outside of the factory buildings is a circular speedway, while between the buildings are driveways. These roads are subjected to very severe use from testing cars constantly passing over them, going out and returning to the factory, generally at great speed; heavy traffic of large trucks, heavily loaded touring cars, etc. Naturally these drives and speedways were dust nuisances, to say nothing of the constant repair work to keep the roadbeds in condition. Much experimenting has been done, and the Pope-Toledo people say they have finally hit upon a road treatment which gives excellent results and is very economical. The factory has its own steel treating furnaces, some oil heated. The sediment from the oil used in the heaters, which is crude oil, and with an ordinary sprinkling-can, such as found around any flower garden, is sprinkled over the surface of the roads. Three treatments a season, it is said, makes a roadbed waterproof.

DESIGNER BYRON CARTER IN THE CARTERCAR.

The Cartercar is one of the leading exponents of the friction transmission type of automobiles, and the 1908 model in the photo shows an attractive design.

AUTOS USED IN MICHIGAN TO "BREAK" TRACKS.

"I have seen automobiles used for many different purposes," said A. L. Kull, vice-president of the Dragon Motor Company, "but, to me, the funniest use I ever saw I ran across in Michigan. There had been a heavy fall of light, dry snow the night before, and it did not pack very well. Our agent took out one of his cars and drove over about five miles of road with two large kettles dragging behind. These kettles were filled with bricks and stones, and as they were drawn along they left two hard-packed tracks, just right for the teams. It seems that these kettle tracks are rather an old device with the farmers and in Winter they use this method of breaking roads through the snow.

"The use of automobiles for breaking snow roads seems to become more general each year. The driver is able to make a straighter track than the old-fashioned team of oxen, which formerly had the field to themselves. In the lumber woods the large contractors use automobiles to visit their different camps, which generally are far back in the woods. I noticed the care which these lumbermen take in building their snow roads, and they are almost perfect for autoing, being hard packed. At night they are sprinkled, and by morning they are smooth, almost level, ice roads.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Feb. 21-29.....—Newark, N. J., Electric Park Auditorium, New Jersey Automobile Trade Association and New Jersey Automobile and Motor Club.
- Feb. 24-29.....—Portland, Me., Annual Automobile Show. F. M. Prescott, manager.
- Mar. 7-14.....—Boston, Mechanics' Building and Horticultural Hall, Boston Automobile Dealers' Association. Chester I. Campbell, manager, 5 Park Square.
- Mar. 11.....—Boston, Bay State Auto Association Clubhouse, First Quarterly Meeting, Society of Automobile Engineers.
- Mar. 9-14.....—Buffalo, Convention Hall, Sixth Annual Automobile Show, Automobile Club of Buffalo. Dai H. Lewis, manager.
- Mar. 16-21.....—Indianapolis, Ind., Annual Show, Automobile Dealers' Association.
- Mar. 18-21.....—Rochester, N. Y., New Convention Hall, First Annual Show, Automobile Dealers' Association and Rochester Automobile Club. Bert Van Tuyle, manager.
- Mar. 21-28.....—Toronto, Canada, St. Lawrence Arena, Automobile Show. R. M. Jaffray, manager.
- Apr. 5-12.....—Montreal, Canada, Arena, Third Annual Automobile and Sportsman's Show. R. M. Jaffray, Mgr.
- April 6-8.....—Denver, Mammoth Rink, Annual Automobile Show. G. A. Wahlgreen, manager.

Race Meets, Hill Climbs, Etc.

- Feb. 22.....—Boston, 150-mile Endurance Run, Bay State Automobile Association.
- Feb. 25.....—Brooklyn, N. Y., Economy Run Montauk and Return, Long Island Automobile Club.
- Mar. 2-7.....—Ormond-Daytona, Fla., Automobile Club of America.
- Mar. 18-19.....—Savannah, Ga., Savannah Automobile Club.
- Apr. 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
- May 4-5.....—Harrisburg-Philadelphia and Return, 150-mile Endurance Run, Motor Club of Harrisburg.
- May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
- May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- Mar. 21-28.....—London, Agricultural Hall, Cordingley's Show.
- May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.

- April 1-13.....—Monaco Motor Boat Races and Motor Boat Exhibition, International Sporting Club of Monaco.
- April 25-May 25.....—Industrial Vehicle Competition, Automobile Club of France.
- May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
- May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
- June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club of Germany.
- July 6.....—Volturette Grand Prix, Dieppe Circuit (Automobile Club of France).
- July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
- Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclussen Automobile Club.
- Sept. 1-8.....—French Volturette Contest, auspices of "L'Auto."
- Oct.....—Berlin, Germany, Gordon-Bennett Balloon Race, Aeronautical Club of Berlin.

WILFORD AND WILFRED GODDARD IN THE AUTO THEY BUILT.

HOW TWO OHIO BOYS MADE AN AUTO.

CONNEAUT, O., Feb. 17.—The problem of raising sufficient cash to purchase an automobile, even a one-lunger, second-hand, sold out cheap, looked too long a task for a couple of fifteen-year-old boys. By the time they had scraped up sufficient notes to be able to stroll into the store and look over the machine with the critical eye of a real purchaser, they would probably be too old to be content with such a production. Besides, they could not wait years, anyway.

So Wilford and Winfred Goddard, twin brothers, resolved they would build their own automobile—design it, make the parts, fit them together, paint the machine and drive it without any outside aid. Making an engine was certainly beyond them. But as many a car builder buys his engine, why should not they? By gathering up all spare cash, uniting the sums, cutting off luxuries for a few weeks and generally exercising supervision over their finances, the amount was raised and the order placed for a single-cylinder engine. There was plenty of material around the house, and little by little the automobile grew into form until finally critics ceased to prophesy that it would never go. Four large carriage wheels cut down to a reasonable size and fitted with 28-inch rims and standard bicycle tires with an extra cover, supplied what was wanted in this department. Two lengths of wood and suitable cross sections of the same material supplied the frame.

WM. L. MULLER, OF DAVENPORT, IA., IN HIS PEERLESS.

Mr. Muller is one of Iowa's most enthusiastic automobilists and has driven his own car many thousands of miles during the past season.

GRIST OF AUTOMOBILE LEGISLATIVE MILL.

It was to be expected that the appearance on the highways of a new means of transportation would bring with it the necessity of radical revision and readjustment of the existing laws relating thereto.

Throughout the country at the present time, not only in State Legislatures, but also in Congress, there is being heard argument for and against automobile legislation, some of it based on common sense, some of it proposed in a spirit of oppression; some of it meeting with approval and some of it denounced in unmeasured terms.

In one State, Connecticut, we find a common-sense law which seems to answer the needs of the situation; in another State, New Jersey, we find a most obnoxious law and a renewed effort to make it still more drastic.

prosecution, though in bringing them to their just desserts many have been and are being subjected to persecution.

Only through organized efforts—local, State and national—can the flood of legislation be kept in well-defined channels, and in supporting the present administration of the American Automobile Association every automobilist is in reality doing nothing more than insuring conditions satisfactory to himself.

If the Federal Registration bill, introduced in Congress by the American Automobile Association, progresses through the national mill and emerges a law, there should follow the united thanks of automobilists to those men who are now working indefatigably for a consummation desired from one end of the country to the other.

RESUMPTION OF INDUSTRIAL ACTIVITY.

Reports from all parts of the country are to be found every morning in the daily papers telling that mills and foundries are starting up, and these announcements are bringing home to the observant the fact that within a short time the return of confidence and the resumption of industrial activity will be complete.

Primarily this will mean a reduced output during the coming season, considering the number of cars built alone, but it will not be simply from the reason that the manufacturers as a whole have come to the decision to produce a lesser number of cars than their original plans for 1908 called for.

CONGRESSMAN MOON ON FEDERAL REGISTRATION BILL

PHILADELPHIA, Feb. 15.—At the sixth annual banquet of the Automobile Club of Germantown, held to-night in the well-equipped home of the organization, those present heard most reassuring speeches from a governor, a mayor and a congressman. In the hundred and a half of listeners there were included men prominent in the city's business and political worlds and of unquestioned influence and substantiality.

Mayor Reyburn was the first speaker introduced by President Thomas B. Prosser, and the city's chief magistrate plainly indicated in his remarks that he is a friend of the automobilist.

Governor Edwin S. Stuart particularly dwelt upon the subject of good roads, and in the course of his closely followed speech said:

The matter of good roads is a matter of great importance to me, and I am doing all in my power to improve the condition of the State highways. The Legislature in its last session appropriated all the money that it could spare from the Treasury, but to get roads as good as those of Europe takes time and patience. If you motorists will only give us time we will have in this State the finest highways in the country, but in obtaining this it must be impressed upon township road supervisors that they must keep them in repair after the State builds them. We need the help of automobilists in securing this aid.

But it was the speech of Congressman Reuben O. Moon, a member of the Judiciary Committee of the House of Representatives, that met with the greatest acclaim. The Federal Registration bill, prepared and introduced by the Legislative Board of the American Automobile Association, is now before this committee and a public hearing has been scheduled for March 12. Congressman Moon, in the course of his forcibly delivered speech, said:

I do not believe that there is to-day in Washington a member of Congress of either house who does not know that an automobile bill is pending. I do not believe there is a member who has not received letters from his automobilizing constituents upon this mat-

ter, and they all come to me as a result, because I am a member of the committee which must pass upon it before it can be presented before Congress.

I can assure you and all automobilists that you are going to receive fair, earnest and sincere consideration in Washington. There is no spirit in the National Capitol among the legislative bodies which is inimical to what you desire. Everyone realizes that there are at present serious obstacles to the progress of the sport and business of automobilizing which need Federal attention. The whole matter depends upon the constitutional power of Congress, and though speaking unofficially, I believe that we have the invested power to grant what you desire, and you are entitled to our earnest consideration.

Freedom of intercourse between the various parts of the country is important, and anything that will break down sectional pride, prejudice and jealousy, is something which goes to make up and strengthen the nation. You are utilizing a novel and effective method of doing this, and broadening interstate relations. It is a fact that commerce is not the only bond of unity between the States, but there must be an intermingling between the people, and this is a great link in the strength of the national chain. There is nothing in the country to-day that is doing more to strengthen the weak links than the automobile. It will give us great pleasure to help you in securing this national legislation, and when I can serve you in any way you have only to call upon Mr. Moon in Washington.

It was to be expected that these words from a congressman would be received with great satisfaction and applause.

Charles W. Bosworth, of Springfield, Mass., next supplied an excellent "fireworks" speech of the evening, and following him came O. S. Henniger, of Allentown, who made the humorous address of the night.

At the head table also sat District Attorney S. P. Rotan, E. T. Stotesbury, Vice-President C. M. Thompson, and Robert P. Hooper, chairman of the A. A. A. Good Roads Board. The guests included Frederick H. Elliott, secretary of the A. A. A.; Charles J. Swain, ex-president of the Quaker City Motor Club, and A. G. Batchelder, managing editor of THE AUTOMOBILE. The function was the most successful in the history of the organization.

FEDERAL AID IN ROADS BUILDING.

WASHINGTON, D. C., Feb. 17.—Out of the mass of good roads bills that have been introduced in Congress since the opening of the present session, it is likely that a bill will be evolved that can be enacted into law. There is no gainsaying the fact that the good roads movement has many friends in Congress, and they believe the time is ripe for the Federal Government to step in and do something for the good of the country's highways.

Not to be outdone by Representative Currier, who wants Congress to establish a National Highways Commission, Representative Sulzer, who represents a New York City district in Congress, has framed a bill to promote the construction of good roads and the efficiency of the postal service. In brief, the bill provides that upon the application of the proper authorities representing any State, the Secretary of the Treasury shall loan to such State for the construction or improvement of post roads within such State the actual cost of such construction or improvement. The Post Office Department is to have general supervision over the construction or improvement of said post roads.

The provision is made that one twenty-fifth part of all money received from the United States Government under this arrangement must be returned to the United States Treasury each year by the State receiving the same until the whole amount received by such State shall have been returned. No interest is to be charged upon money loaned in this manner, provided it is promptly repaid, as stipulated, but a 5 per centum interest charge will be added to all deferred payments.

FRANCE AND THE ROADS PROBLEM.

PARIS, Feb. 10.—Frankly recognizing that even the best of existing highways are not what they should be for present methods of transportation, and are likely to become still less suited with the growth of the automobile, Minister of Public Works Barthou has called an international conference, to be held probably in Paris preceding the annual automobile Salon. The general study will be on the adaptation of highways to new methods of travel, the principal divisions of the congress being:

1. Road construction and repair: road foundations, methods of work, results obtained.
2. General methods of road preservation: stone roads, paved roads, and various.
3. Anti-dust methods: the use of tar and other products, sweeping and watering, technical and economic results.
4. Future roads: laying out in length and cross section, surface, various difficulties, curves, special tracks, etc.
5. Traffic: effect of new methods of locomotion on present roads, damage due to speed and weight, influence of tires, steel rims, exhaust, etc.; effect of roads on vehicles, deterioration of mechanical organs, skidding, etc.
6. Road signals: kilometric signposts, direction, distance and altitude indicators, danger signals.
7. The road and industrial transportation by trolley cars, buses and automobiles.

Invitations to the conference will be sent out to all automobile associations and to every organized body in any way connected with the improvement of highways, while the government of every foreign country will be asked by the French Ministry to send an official delegate. The question of perfect highway throughout Europe has become such an important one that much good is anticipated from the gathering.

M. J. BUDLONG LEAVES A. L. A. M. TO JOIN PACKARD.

AFTER a few months at the head of the Association of Licensed Automobile Manufacturers, Milton J. Budlong will shortly join the staff of the Packard Motor Car Company in the capacity of assistant general manager.

Interviewed at the offices of the A. L. A. M., Mr. Budlong declared that there was now no reason to hide the fact that his connection with the Licensed Association had never been considered as other than a temporary one. "When I took up the direction of the association affairs last November I was already in negotiation with the Packard company, and my departure from the association affairs is, therefore, no sudden move.

"For the last four months the work of reorganization of the A. L. A. M. has been carried on so thoroughly that the association is now in a stronger and more satisfactory condition than at any previous period. While there has been a reduction of expenses, there has been no curtailment of the activities of the association; better results are being obtained by more harmonious working, litigation in connection with the Selden patent is progressing satisfactorily, and the whole situation is one of greater strength.

"The agency position is one point on which erroneous impressions have got abroad. Instead of abandonment, this branch of the association work will be carried on with more thoroughness than ever, the exclusive agency policy being enforced as it has not been done in the past. The technical work, too, will be vigorously pursued, the closing of the

laboratory at Hartford being but temporary. Litigation in connection with the Selden patent is in such an advanced condition that the final tests of the Selden models will positively be held Monday and Tuesday of next week."

No definite action appears to have yet been taken towards the appointment of a successor to Mr. Budlong, nor is the date of his departure altogether decided upon. "There yet remains a number of matters to be put into shape," said Mr. Budlong, "and I shall not leave the association offices until everything is on a sound footing."

From the Packard company this announcement comes: "An addition to the administrative staff of the Packard Motor Car Company brings to it, as assistant general manager, Milton J. Budlong, manager of the Association of Licensed Automobile Manufacturers. He leaves the association to join the Packard forces shortly to assist Henry B. Joy and S. D. Waldon in executive affairs. Mr. Budlong is a valuable accession to the Packard company. His well known ability as a factory executive is supplemented by a long and profitable experience. Prior to becoming manager of the A. L. A. M. last November, Mr. Budlong was for several years president of the Electric Vehicle Company. At one time he was president of the National Association of Automobile Manufacturers, while before his connection with the Electric Vehicle Company he had obtained a thorough business training by many years in both the retail and manufacturing ends of the bicycle trade."

NEWARK'S BIG SHOW OPENS FRIDAY.

NEWARK, N. J., Feb. 18.—The work of transforming the big auditorium at Electric Park into a palace of gold and white is now well under way and the exhibits will begin to arrive to-morrow, preparatory to the opening of Newark's first automobile show on Friday, February 21. The show will remain open until the following Saturday week, February 29. The following concerns have taken space: Greene Motor Car Company, Locomobile and Oldsmobile; Motor Car Company of New Jersey, Packard, Autocar, Cadillac and Northern; Herman J. Koehler, Buick and Waltham; Jacob W. Mason, Maxwell and Stoddard-Dayton; Star Motor Car Company, Pullman and Napier; W. S. Maltby, Corbin; Highgrade Motor Car Company, Ford; Clavert-Zusi Company, Winton; Charles Cooper, Atlas; Osborne & Morton, Brick Church Automobile Company, Auburn; Carl H. Page Company, Peerless; Ellis Motor Car Company, Knox and Pierce Great Arrow; Rickey Machine Company, Marmon; Sheldon W. Chase, Holsman; Mitchell Auto Company of New Jersey, Plainfield Motor Company and Central Motor Company of Bloomfield, Mitchell cars; Brush-McLaren Motor Company, Brush runabout; J. J. Meyer.

YALESIANS CAN'T HAVE HILL CLIMB.

NEW HAVEN, CONN., Feb. 17.—At a weekly meeting of the New Haven Auto Dealers' Association, it was announced that the local show will be held in Music Hall, March 18 to 24. Special nights have been designated.

At a meeting of the City Park Board held Saturday a petition was received from the Yale Auto Club asking that permission be granted them to hold a hill climbing contest in East or West Rock parks during the coming spring. Both of these parks are the finest mountain parks in this part of the country, but automobiles are prohibited by city ordinances. In view of this fact, the board decided that it had no authority to grant this request.

DETROIT SUPPORTED TWO SHOWS.

DETROIT, MICH., Feb. 17.—All doubt as to the ability of Detroit to support two automobile shows appears to have been set at rest by last week's achievement, when the Tri-State Automobile and Sportsmen's Association held its seventh annual show. It was freely predicted that the dealers' show held earlier in the winter at Riverview Park would kill the second one, but these fears proved unfounded. Not only was the attendance up to former marks, but sales were of a gratifying nature. Some ninety cars were sold at the armory, the total amount involved in the transactions being close to \$125,000. Besides this a considerable amount of wholesale business was transacted.

Whether there will be two shows another year is yet to be determined. The Tri-State Association has engaged the armory for 1909, and the attitude of the Dealers' Association is being awaited with interest. Manager E. E. McMaster, to whose good work can be attributed the success achieved by the Tri-State Association, was presented with a handsome diamond ring just before the close of the show, the gift being from exhibitors as a token of their appreciation for what he had done.

BISON CITY SHOW WILL BE A FINE ONE.

BUFFALO, N. Y., Feb. 17.—Arrangements for the automobile show to be held in Convention Hall during the week of March 9 are well under way. Secretary D. H. Lewis declares the approaching display will be the finest that the Buffalo Automobile Club and Dealers' Association have ever attempted. The feature, aside from the many exhibits, will be the ceiling and mural decorations. These will be done in blue and gold, and the effect will be, when the myriad electric lights are turned on, of a canopied heaven containing thousands of stars. There will be four large groups of electric lights, each composed of 500 bulbs, and also fourteen festoons of electric illuminations hanging from the ceiling.

ONE OF THE BEST STRETCHES ON LA ROCHE AVENUE.

SAVANNAH'S BIG ROAD MEET.

SAVANNAH, GA., Feb. 17.—With the stock chassis speed endurance contests a little less than a month away, Savannahians are wrought up over the idea of the big road races, and from the inquiries which are pouring in the success of the meet will far exceed the most sanguine expectations of the Savannah Automobile Club when it undertook to promote the races. Everything is being rapidly whipped into shape for the contests, and the local club is on the last lap of the preparations for the three events. At a recent meeting of the executive board having the races in charge at this end, on which are the mayor and the most prominent citizens, a syndicate of ten of the monied men of the city was formed to underwrite the affair, thus removing any financial obstacle which might have been encountered. Immediately following this action, Mayor Tiedeman wired twenty-nine manufacturers, whose entries have not yet been received, a guarantee that the races would be held on the dates announced.

With the obstacles which appear to be thrown in the way of the proposed Long Island course for the Vanderbilt Cup race, the Savannah Automobile Club is already getting ready to make a bid for this blue ribbon event of American automobile racing. It is believed here that the local course is far and away the best one available for the contest for the Vanderbilt Cup, and that Savannah will, by its conduct of the stock car races, establish her claim to the bigger event. Added to the magnificent course which is offered, it is believed that the facilities for policing it are the best which can be obtained in America.

In Savannah, a city of 75,000 inhabitants, there is a citizen soldiery, composing the National Guard, of over 1,500 men. These are the flower of the city's population. At recent meetings of the commands which make up this force, resolutions were adopted without a dissenting vote offering to police the course for the stock car races. Following this

up, the Hon. Hoke Smith, Governor of the State, gave his promise to the people here that he would order out the militia to police the course. This is but a detail which shows the interest being manifested in the races. The County Commissioners have tendered the services of the convicts to assist in preparing the roads for the races.

A slight change has been made in the course, which eliminates four turns and substitutes two others. This change leaves the course practically the same length as before, and in addition gives a straightaway run to the grandstands of a little over three miles of the widest and best roads in the course. In order to make this change a stretch of road a quarter of a mile has to be paved, but this work is already under way. Practically few roads intersect the course. As it stands a corner of the course is bisected by one of the big railway systems entering the city, but this is to be avoided by a wide sweeping curve which will leave the railroad tracks outside. Where the suburban street railway lines bisect the course they are to be paved over, and high foot bridges erected over the tracks, so that passengers may be transferred from one side of the road to the other without interfering with the progress of the races.

Day of Big Race to Be Civic Holiday.

Mayor Tiedeman has announced that he will declare a public holiday for March 19, when the 360-mile race will be held for the Savannah Trophy. The Clearing House Association will probably declare Saturday banking hours for both days of the races. The railroads have promised cheap rates from all points within a wide radius, and tourist rates will prevail from the more distant points. An issue of 25,000 sets of postcards showing twelve views of different parts of the course is being sent out. A quarter of a million booklets have been printed by the Chamber of Commerce advertising the races, and these are being stuffed into the mail sent out by the business houses of the city.

The interest in Savannah is being matched by a goodly measure of interest from the outside. A number of men representing the manufacturers have visited Savannah and hardly a day passes but some new ones show up. These are obtaining a look over the course for the purpose of reporting to the manufacturers. Frank Leland, who will share with Barney Oldfield the honor of piloting the Stearns entries, has been on the ground and drove a Stearns car over the course. He remained in the city several days, departing with the remark on the course that it was "simply wonderful." R. B. North, representing the Locomobile people, is now in the city. W. S. Morton Mead, of the Lozier Company, has just left. He says: "The people in the North don't know such a course exists in America."

Walter West, of the Empire Tire Company, was among the several representatives of tire companies to go over the course within the last few days. He says: "There is no course in the United States so adapted to speed as the Savannah course." R. H. Johnston, of the White Company, says: "It will be a record-breaking event." J. M. Rich, of Minneapolis, a tourist who is wintering at Savannah with his Stoddard-Dayton roadster, says of the roads: "There are no such roads in the United States as those around Savannah, and I have traveled all over the country."

In fact, the Savannah people are beginning to fear that the roads are too good for the Vanderbilt Cup race. One member of the Technical Board of the A. A. A., when taken over the course previous to the granting of the sanction for the March meeting, inquired, "Where are your hills?" He thought there ought to be hills to give their climbing as a feature of the tests the race would impose on the machines. The country is as flat as a billiard table, but if the hills are insisted on the Savannahians would be tempted to build some artificial ones just to be accommodating. As a speed-eater

H. S. RICH TRYING SAVANNAH COURSE IN HIS STODDARD-DAYTON.

the course can't be beat. Local drivers have negotiated some of the straight stretches at 79 miles an hour. Mr. North, in his Locomobile, jumped his speedmeter to its limit, seventy miles, within a short time after his getaway on the first stretch that goes straight as a crow flies to its first turn five miles away.

The contract for the first grandstand, to seat 5,000, has been let, and the city has granted space for the parking of automobiles and carriages. The decision as to the trophies, which will cost \$3,000, and for which designs have been submitted by Tiffany, Gorham and other nationally known silversmiths, will be made within a few days.

In many Northern cities special cars are being arranged for to bring parties to Savannah. Sidney B. Bowman, the New York agent for the Apperson, writes that his party will have a special car from New York city on March 16. President Chalmers and Vice-President Coffin, of the Thomas Detroit Motor Company, are among other tradesmen coming.

Event No. 3, it has been officially announced, is not to be limited to six-cylinder cars, but will be open to all cars of 575 or more cubic inches cylinder displacement, providing they otherwise conform to stock limitations.

Wants Endurance Run, Philadelphia to Savannah.

PHILADELPHIA, Feb. 17.—Ever since the New Year's run of the Quaker City Motor Club, A. J. King, manager of the local Studebaker agency, has been carrying a good-sized chip on his shoulder. His car was one of the three clean-scorers that was allowed to start in the run-over. It will be recalled that the White was declared the ultimate winner after one of the hardest and closest contests on record. Now Manager King sees a chance to get even. The rush for the Savannah races next month will attract quite a number of local enthusiasts, and he proposes a race from Philadelphia to Savannah, with the White, Peerless and Studebaker as contestants.

MAXWELL CHALLENGE ACCEPTED BY STANLEY.

The Maxwell twelve-cylinder racer and F. E. Stanley's short-distance steam sprinter will struggle for speed supremacy on some date yet to be settled between May 13 and 17. When the Dewar trophy was removed from the program of the Ormond meet, the Maxwell-Briscoe Company issued a challenge to the Stanley for a special match on the Florida beach. It is not possible to take the steamer to Ormond, but Mr. Stanley is willing to meet his multiple-cylinder adversary at a later date and has agreed to the period selected. During the races at Ormond F. E. Stanley and B. J. Briscoe, Jr., will confer on details. Atlantic City, Cape May, or some other straightaway will be chosen and other cars may enter.

FLORIDA'S MEET TO TAKE PLACE.

All doubt about the holding of the Ormond-Daytona Beach races in Florida during the week of March 2-7 was set at rest Monday, when, after a meeting of the Contest Committee of the Automobile Club of America, Chairman Robert Lee Morrell made the definite statement that the races would be held as advertised. He said:

"We have received no less than twenty-eight entries for the six events, which include twelve of the highest powered cars in the world, and if records do not fall next month I will be surprised. So many rumors have been in circulation in regard to these races that many dealers and manufacturers have refrained from entering their cars, and in order to give them an opportunity to come in we have extended the time for receiving entries up to February 29. Mr. Butler and myself will leave New York on Saturday for Florida to arrange the final details for the races. We have also secured a special compartment club car for the accommodation of the members and contestants, which will leave New York Saturday, February 29, over the Seaboard line."

MISSOURI WANTS VANDERBILT CUP RACE.

JEFFERSON CITY, Mo., Feb. 17.—The St. Louis Automobile Club wants the Vanderbilt Cup race for 1908 held in Missouri. The club has been after Governor Folk regarding the use of troops in guarding a course. To-day Governor Folk stated that he would permit the use of the National Guard to police a circuit for the Vanderbilt Cup race if it is held in Missouri. Two courses are being considered, both being within twenty-five miles of the city. It is said that either one of the proposed courses will meet all the requirements of the most exacting racing board.

CONVICTS ARE AT WORK ON THE FAST SAVANNAH COURSE.

IN THE PARLIAMENTS OF THE AUTO CLUBS

BUFFALO WANTS THE NATIONAL CONVENTION.

BUFFALO, N. Y., Feb. 17.—The Automobile Club of Buffalo held its first of a series of winter entertainments in the Main street clubrooms last Saturday night. President Hower reported that the organization was rapidly closing on the Automobile Club of America in the race for the largest membership of any automobile club in the country. The Buffalo club now has a membership of 1,099 to its rival's 1,500. He reported progress in the matter of the Niagara boulevard.

President William H. Hotchkiss of the American Automobile Association called upon the members to secure for Buffalo this summer the National Automobile Convention. He said the Association would hold its first great convention this year, and said the gathering would bring together all

HARRISBURG'S CLUB ELECTS NEW OFFICERS.

HARRISBURG, PA., Feb. 17.—At the annual meeting of the Motor Club of Harrisburg, held at its headquarters in the Patriot Building, the following officers were unanimously elected: Vance C. McCormick, president; O. C. Robertson, first vice-president; C. C. Cumbler, second vice-president; J. Clyde Myton, third vice-president; J. Sydney Sible, secretary, and J. C. Nissley, treasurer. J. C. Aldrich was elected to the board of governors for a two-year term, and Howard L. Jenkins, James McCormick, Jr., and Roy Senseman for three-year terms. The election was followed by a smoker, at which the plans for the big endurance run next May were discussed at length. At the business meeting which preceded the election, the good roads committee read a report of its work

BANQUET NEW JERSEY AUTOMOBILE CLUB, HELD, NEWARK, N. J., FEBRUARY 6, AT WHICH THE JERSEY LAW WAS DISCUSSED.

good roads experts, highway commissioners, automobile legislators and motor enthusiasts. It would be a general congress for all interested in automobiling, at which the solution of many difficult questions would undoubtedly take place. There would also be speed and technical tests. President Hotchkiss said Buffalo would again be the starting point of the tour.

President Hower announced that the directors had subscribed \$500 to land the convention, and E. R. Thomas, of the E. R. Thomas Motor Company, had personally contributed \$250. He said he had an assurance that G. N. Pierce, of the George N. Pierce Company, would contribute an equal amount. Buffalo's claims on the convention are strong and consistent, as the city is a central shipping point which would make it easy to land cars there without undue expense, while it also has another strong factor in its favor in its close proximity to Niagara Falls, which is an attraction of never-failing interest that will probably help tip the balance of favor in the direction of the city by the lake. Various forms of vaudeville entertainment were arranged by Howard D. Herr, the chairman of the entertainment committee.

during the past year and talks on good roads were given by J. C. Nissley, J. S. Sible and O. C. Robertson. R. C. Halde-man, chairman of the contest committee, reported on the work accomplished by his committee during the year, as well as the plans for this year's work, while Charles A. Sef-ton, head of the membership committee, reported good progress. Secretary Sible broached the matter of affiliation with the Pennsylvania Motor Federation, and it was resolved to apply for membership. W. O. Hickok, 3d, brought to the attention of the club members the Federal Registration bill now pending, and it was resolved that a committee of three be appointed to call on Congressman Olmstead to ask his support.

HARTFORD'S ENDURANCE RUN SET FOR MAY 16.

HARTFORD, CONN., Feb. 17.—Saturday, May 16, is the day that has been selected for the 200-mile endurance run of the Automobile Club of Hartford, and the following route has been decided upon: Hartford to Middletown, to Meriden, to Southington, to Waterbury, to Thomaston, to Bristol, to New

Britain, to Hartford. The distance is approximately 100 miles, and the course must be covered twice. The event will be under the direction of the committee on racing, which consists of Hiram P. Maxim, chairman; C. H. Gillette, C. D. Rice, F. W. Dart and W. T. Plimpton. At the last meeting of the club 27 new members were admitted.

CANADA'S MOTOR LEAGUE ACTIVE.

TORONTO, ONT., Feb. 14.—An enthusiastic annual meeting of the Ontario Motor League was held the other evening at the King Edward Hotel. Noel Marshall, the retiring president, occupied the chair. The election of officers for the ensuing year resulted as follows: President, T. A. Russell; vice-president, Wm. Dobie; directors, George H. Gooderham, A. E. Chatterton, F. E. Mutton, W. Stone, J. C. Eaton, F. F. Miller, W. W. Doran, George Graham, Lloyd Harris, Paul J. Myler, O. Hezlewood and Noel Marshall.

It will be remembered that the Ontario Motor League a year ago succeeded the Toronto Automobile Club, and is now a provincial organization. The membership has extended largely to members outside of Toronto, and it is the purpose of the league to encourage the organization of local clubs in outside towns, which will be in affiliation with it, and thus strengthen the influence of the Ontario Motor League in promoting the common interests of motorists in Ontario.

HERE'S AN IDEA TO INCREASE MEMBERSHIP.

WASHINGTON, D. C., Feb. 17.—A novel plan has been devised by the Automobile Club of Washington to increase its membership. The entire membership has been divided into two parts, one part of which will be captained by F. S. Bliven and the other by A. G. Newmeyer, and the two opposing sides will endeavor to bring in the largest number of new members. The losing side will stand the expense of a smoker at the club's country home. Mr. Bliven will have as his lieutenant Rudolph Jose, while Harry Ward will act as his secretary. Mr. Newmeyer has designated H. Chadwick Hunter and Royce Hough to act in the same capacity for him. Each side is out to win and the rivalry is intense.

CLEVELAND'S CLUB IS A LIVE A. A. A. BODY.

CLEVELAND, O., Feb. 17.—In the bulletin of the Cleveland Automobile Club, just issued, are the following paragraphs:

"Have you ever stopped to think that you are delaying the advent of ideal motoring conditions whenever you thoughtlessly neglect your customary courtesy to the driver of the horse-drawn vehicle?"

"The quickest way to 'educate' the farmer is to sell him an automobile—within ten days after he'll be clamoring for a Uniform Motor Vehicle Bill and the passage of the Good Roads Bill."

"A careful and courteous driver presents irrefutable argument for more liberal laws."

"Isn't it worth \$10 a year to you to feel that you are a member of the Cleveland Automobile Club, the American Automobile Association and the Ohio State Automobile Association, and are doing your part to help motoring conditions throughout the city, State and nation?"

MANITOBIANS ORGANIZE FOR PROTECTION.

WINNIPEG, Man., Feb. 15.—The efforts of Manitoba farmers to rush a bill through the legislature governing automobiles has led to the formation of the Manitoba Motor League. At a special meeting held at the Winnipeg Grain Exchange the following officers were elected for the season of 1908: Honorary President, Judge Phippen, Winnipeg Automobile Club; president, W. A. Elliott, Brandon Automobile Club; first vice-president, D. Boyce Sprague, Winnipeg Automobile Club; second vice-president, Joseph Maw, Winnipeg Automobile Club; third vice-president, Harry Stevens, Portage La Prairie Automobile Club; secretary, W. R. Bacolf, Winnipeg Automobile Club; treasurer, L. R. Barrett, Winnipeg Automobile Club.

DOINGS OF THE SKY NAVIGATORS.

ELEVEN BIDS FOR ARMY DIRIGIBLE.

Eleven persons or firms are willing to build a dirigible balloon for the United States Army at prices varying from \$6,000 to \$33,500. The bids, which are being considered at the office of Brigadier Gen. James Allen, Chief Signal Officer, closely follow the prescribed specifications and are believed to be of a sufficiently satisfactory nature to allow of an award being made. Should more than one balloon be considered suitable, an effort will be made to obtain sufficient funds to allow of the purchase of two dirigibles. The following is the complete list of bidders, with the price quoted by each:

Harry B. Schiller, 514 Brown street, Philadelphia; time, 180 days	\$33,500
S. C. Rockman, 2844 Lehigh street, Philadelphia; 180 days....	25,000
Peter Cooper Hewitt, Madison Square Tower, New York City; 200 days	20,000
Lewis Lupetl, Paris, France; 90 days.....	20,000
Capt. Raymond Anglemire, Chicago; 90 days.....	17,500
Carle E. Myers, Frankfort, N. Y.; 120 days.....	11,994
Bumbaugh and Helmann, St. Louis; 250 days.....	10,000
Charles Ellis, Toledo, Ohio; no time given.....	10,000
William Relfersheld, Streator, Ill.; 150 days.....	8,000
Thomas S. Baldwin, 78 Madison Square, New York City; 150 days	6,750
G. F. Myer, Hammondsport, N. Y.; 100 days.....	6,000

AERO CLUBS TO FORM NATIONAL FEDERATION.

Arrangements have been completed by the Aero Club of America for the formation of a national federation of the aeronautical clubs of the United States, of which there are now about one dozen. Boston, St. Louis, Philadelphia and Canton, O., four of the most influential clubs in the country, have given their support to a scheme which will doubtless in a short time combine all similar associations in the United States. The plan of federation will closely follow that adopted with considerable success in France, the federated clubs having equal representation in all matters of national interest, and the Aero Club of America representing this country in all foreign relationships.

ZEPPELIN TO BUILD A 100-PASSENGER AIRSHIP.

BERLIN, Feb. 11.—Count Zeppelin, as soon as he has completed the balloon now under construction, intends designing a dirigible airship commodious enough to convey 100 persons, a matter not at all as improbable as the majority of people would think, for past experiments all point that such a balloon could be constructed on the same principles as the present ones are, with the increased diameter and length and greatly increasing the carrying capacity. Major Hoernes, the noted Viennese expert, is of the same opinion as the Count, and both men substantiate their statements by figures.

23 ENTRIES FOR BENNETT BALLOON RACE.

BERLIN, Feb. 11.—Twenty-three entries have already been received for the aeronautical race for the James Gordon Bennett trophy to be started from the suburbs of Berlin next October. Last year the race at St. Louis only attracted nine entries, and the first event at Paris secured sixteen starters. The countries engaged in the contest are the United States, Germany, Belgium, England, France, Italy and Spain, each with three balloons, and Switzerland with two. Russian and Austrian aeronauts have also promised to compete.

AERO CLUB ANNUAL DINNER MARCH 14.

The second annual dinner of the Aero Club of America has been fixed for March 14, at the St. Regis Hotel. The plan of seating, which was tried so successfully last year, will be repeated, members being seated in the order in which application for invitations is received.

JONES MAKES FIRST AMERICAN TAXIMETER.

Anticipating an early demand in this country for a reliable taximeter, Joseph W. Jones, of New York, the pioneer inventor of the speedometer, made a close study of the European models three years ago when they were already in universal use on the horse cabs of Paris and Berlin. These early types of cab fare registers had numerous defects and, with the latter in mind, Mr. Jones set about designing an instrument of his own, which is now about to be placed on the market, and is known as the Jones Taximeter. The instrument measures about seven inches in diameter by four inches through, and has a silver dial-face carrying figures indicating the tariffs and extras, as well as the total fare to be paid. The dial on the reverse gives the total of all moneys collected, total mileage and trip mileage, which can be reset by the driver. It also shows a separate count of the number of trips with single and double tariff. A vacant sign is also displayed on the rear and, when turned to a horizontal position, sets the instrument at Tariff 1 and registers the initial charge of 30 cents. For each additional quarter mile a charge of 10 cents is registered and added to the total, the driver turning a knob on the back for any extras, which are automatically totaled. For four or more passengers the driver turns the vacant sign to the left, causing the instrument to register an additional 10-cent charge for every sixth of a mile. A clock mechanism registers equivalent charges for waiting time.

FRONT AND REAR VIEWS OF THE JONES TAXIMETER.

AUTO CREDIT ASSOCIATION DOES GOOD WORK.

At its annual meeting held last month, the Automobile Trade Credit Association elected George L. Holmes, of the Jones Speedometer Company, and Fred S. Wilson, assistant secretary of the Trenton Rubber Manufacturing Company, members of the board of directors. The other members of the board are W. B. Lasher, Weed Chain Tire Grip Company; Carl Kaufman, Motor Car Equipment Company; H. B. Mirick, National Electric Supply Company; E. S. Fretz, Light Manufacturing & Foundry Company. The association, which has an office at 80 Wall street, New York City, is a purely co-operative organization, which is officered and managed by its members for their mutual benefit in the extension of credit and the collection of outstanding accounts. It is the only credit organization of its kind in the industry and is confined to manufacturers and wholesalers in the automobile and motor boat field. The officers are W. B. Lasher, Weed Tire Chain Grip Company, president; M. J. Martin, G. A. Haws Company, treasurer, and Franz Neilson, secretary. Its success is evident from the fact that claims aggregating \$75,000 were turned over to it for collection during 1907, of which in excess of 75 per cent. was collected at no expense to the members other than the annual dues, which are small.

WELL DEFINED LINES OF THE NEW FRANKLIN ROADSTER.

TWO ATTRACTIVE FRANKLIN MODELS.

Now that chassis design and construction are approaching more and more to a uniform standard in many respects, not alone where the various models of the individual manufacturer are concerned, but considering American cars as a whole, regardless of the special exclusive features to be found on many of them, an increased amount of attention is being paid to the matter of body design. The latter reached the status of an art with the carriage builder many years ago, but it is only recently that the automobile manufacturer began to give it the amount of attention this highly important part of the car deserved. That is, within the past few years. Before then, the comfort of the passenger was considered a matter of secondary importance, for the builder of the car was entirely engrossed in turning out a machine that combined reliability of performance with enduring qualities.

Things have changed considerably where body-making is concerned in the past few years, and some of the automobile manufacturers can now boast of as complete a body-making plant as is to be found in any of the old-established carriage factories, while the product of this department of the works ranks as high as anything of its kind to be had, either here or abroad. Two instances of this are to be found in the Franklin cars depicted on this page. The first, heading the column, is an attractive runabout model recently produced by the H. H. Franklin Manufacturing Company, Syracuse, N. Y. It is built on the chassis of the regular Franklin Model D as a foundation, and with its neat rumble seat and racy lines is a striking addition to the popular roadster type of car. It has a four-cylinder, 28-horsepower engine, selective change-speed gear, 105-inch wheelbase, and weighs 2,000 pounds. The second car is built on the same chassis and is a special town type owned by O. J. Gude, New York.

SPECIAL TOWN CAR BUILT ON MODEL D FRANKLIN CHASSIS.

ELECTRIC VEHICLE CO. AT A STANDSTILL.

HARTFORD, CONN., Feb. 17.—On account of the failure of the main creditors of the Electric Vehicle Company to agree upon terms of reorganization, the receivers have been instructed to cut off all expenses. As a consequence most of the few remaining employes in the office have been laid off and the officers and engineers have been released.

Since the time of closing on December 10, 1907, a considerable number of the office employes have been kept to attend to closing up the business, to make a complete inventory, and to keep the accounts of the receivership. There has been also a small force in the repair department and a few men were employed in making repair parts. The latter have been entirely cut off and the repair department cut down with the possibility of the doors being shut entirely.

It seems particularly unfortunate that the company should be compelled to close its doors at this time, because, from a sales and manufacturing standpoint, the prospect was never so bright as at the close of the New York shows. It is a noteworthy fact that the sales at the recent shows exceeded those of any past year, and the sales manager, Mr. Kyte, stated that practically the entire output for the year had been disposed of, and when the crash came it was, of course, necessary to cancel all of these orders. It was also a disappointment to the American trade because of the fact that the electric transmission on the 48-horsepower touring car, perfected after years of hard work by J. B. Entz, is the only car of its kind on this side of the Atlantic, and it is confidently believed that the system is superior to any produced abroad. Ten cars of this type were built during the past year and all are in successful operation, the most of them being sold in New York, Toledo, and elsewhere.

The receiver, Mr. Nuckols, stated that nothing definite can be said of the future of the company. It may be that the creditors and stock and bondholders will not be able to agree upon terms of reorganization, in which case the plant will go to the highest bidder. But, on the other hand, it is hoped that a reorganization may be consummated and the business continued along established lines. With a reasonable capitalization there is little doubt that success would be assured.

HARTFORD RECEIVERS MAKE REPORTS.

HARTFORD, CONN., Feb. 17.—The report of Albert L. Pope, as receiver for the Pope Manufacturing Company, to the Superior Court, shows total cash receipts of \$141,000 for the month of January, which with \$11,000 cash on hand, makes a total of \$152,000. This consists of the proceeds of accounts collected, receiver's sales, deposits on cars ordered, receipts from receivers in Massachusetts, Maryland, and the Pope Motor Car Company, Toledo, O. During the same time the disbursements totaled \$129,000, and the accrued liabilities of the receiver for materials, supplies, payrolls and miscellaneous items, came to \$44,000. The balances due to the receiver from receivers in other States total \$14,000, while the accounts receivable from sales made reach \$94,000, composed of \$97,000 as per the December report, plus sales of \$129,000 during January, less the cash receipts during that month. There is also due the Hartford receiver for transfer of materials to other districts, some \$6,000.

In their report for the month of January, Halsey M. Barrett and Henry W. Nuckols, as receivers for the Electric Vehicle Company, show receipts as follows: Collections, \$6,300; sales, \$7,500; collections on receiver's account, \$3,800; Selden royalties, \$9,700, these sums with a few other small items making a total of \$38,000 for the month. Against this the disbursements for payrolls and the like total \$16,000, showing a cash balance on hand of close to \$22,000.

PLAN TO REORGANIZE ROYAL COMPANY.

CLEVELAND, Feb. 17.—The Superior Savings & Trust Company, receiver of the Royal Motor Car Company, has made public the result of the findings of a special committee of three recently invited to suggest a plan for the reorganization of the company. This committee consists of Charles E. Adams, vice-president of the Cleveland Hardware Company; S. F. Haserot, president of the Haserot Canneries Company, and formerly chairman of the board of directors of the Royal Motor Car Company, and F. A. Scott, secretary and treasurer of the Superior Savings & Trust Company. The court appointed J. D. Cox, formerly president of the Cleveland Twist Drill Company; C. C. Bolton, formerly of the M. A. Hanna Company, and Ambrose Swasey, vice-president and treasurer of the Warner & Swasey Company, as appraisers to fix the value of the plant, and acting upon the report of the latter, the special committee of three recommend that a meeting of the creditors be called immediately to consider a plan for the reorganization of the company, it being proposed to capitalize the indebtedness.

The appraisers report the total assets of the company, consisting of realty, plant, equipment, machinery, parts and complete cars, at \$398,000 as a going concern. The accounts receivable and other items, including membership in the A. L. A. M., bring this up to \$444,000, while the liabilities total \$511,000, showing an excess of the latter over assets of \$67,000. The special committee, among its other findings, states that in case of dissolution, the creditors will lose some \$80,000 representing the company's equity in its realty, now subject to foreclosure at any time owing to default in payments to the mortgagee, and a very large percentage of the value of the parts and unfinished cars, appraised at \$98,000, as the latter would sell for little or nothing in their present state. It also finds that there are about 400 creditors, 235 of which hold claims of \$100 or less, and it is recommended that the latter, amounting to about \$6,000, be paid off by the receiver. The plan calls for the issue of preferred stock to the remaining creditors and their control of the company until 50 per cent. of such preferred stock shall have been retired, then a limited representation of the old stockholders.

NEW CATALOGS THAT HAVE BEEN RECEIVED.

New York Sporting Goods Company.—Dealers in automobile accessories and motorcycle supplies will be interested in the new catalogue published by this house from their headquarters at 17 Warren street, New York. It is an attractive publication, showing all kinds of supplies for automobile purposes. The price list shows the net cost, the confidential quotations only being given to those who are legitimately engaged in the trade.

Imperial Brass Manufacturing Company, Chicago.—Practically all brass work employed in connection with an automobile being handled by this firm, the 1908 catalogue covers a very extensive field. Some of the more prominent articles in the well-produced and carefully illustrated catalogue are pumps, cocks and valves, lamps and lamp brackets, radiator and hood trimmings, and body fittings.

Wright Cooler and Hood Mfg. Company, Chicago.—Automobile radiators, mudguards, gasoline tanks, engine pans and garage floor pans form the chief items in the catalogue sent forth from this house. Illustrations are given of a number of standard lines in radiator construction and folding and stationary hoods.

McCord & Company, Chicago.—Force-feed lubricators are expected from a catalogue bearing the name of this firm, and are to be found the 16-page catalogue giving, in addition to a varied series of lubricators, some particulars of McCord radiators, gaskets and coiled wire belting.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Realizing that Canada is becoming one of the best export fields open to the American manufacturer, the Studebaker Automobile Company, New York, of which C. F. Redden is general manager, will make an exhibit at Toronto, Ont., at the automobile show to open there on March 20.

D. P. Nichols & Co., 116-122 West Brookline street, Boston, Mass., are building for J. M. Duggan, a convertible limousine ambulance. This is a new departure in the ambulance line, being so designed that it has at all times the appearance of a stylish private car. When in use as an ambulance it is provided with a cot, pneumatic mattress and all necessary equipment, with room inside for two passengers besides the patient and cot; and when not arranged as an ambulance is a luxurious eight-passenger limousine. This car is intended for hospital and private service, where patrons wish to avoid the conspicuousness of an ordinary ambulance. Nichols & Co. are endeavoring to complete this car for exhibition at the Boston show, March 7-14.

Under the title of the "P. & H." Tire Company, a firm has just been organized to market the "P. and H." reinforced inner tube. The officers are: R. G. Howell, president; Paul H. Pelletreau, secretary and treasurer, and J. D. Prince, general manager. The new concern will open an office at 1,657 Broadway, New York. The "P. & H" tube is designed to reinforce the outer casing of the tire and differs from the regular inner tube in that it is reinforced with two layers of fabric laid in such a manner as to give the required elasticity. This reinforcement is said to give an increase of more than ten times the strength of the inner tubes now commonly used, thereby preventing blowouts, pinching and other prevailing troubles.

"While the West has always been a good field for automobiles, I believe that the Western sales for 1908 will eclipse those of previous years," says W. H. Van Dervoort, maker of the Moline car and auditor of the American Motor Car Manufacturers' Association. "Manufacturers, regardless of their locality, have conceded that the East held all automobile sales records, but I am confident the West will soon win this distinction. I do not say this without foundation. The West is in an unusually prosperous condition, especially the farmers. The farmers are more interested in automobiles than heretofore, and this class of buyers will purchase a large quantity of cars this year. The Western States are paying more attention to road improvement and consequently the highways will be in better shape for touring in 1908, which undoubtedly will increase the automobile sales."

"The demand by automobile manufacturers for special high-grade springs has compelled the Cleveland-Canton Spring Company, Canton, O., to increase its facilities in this department," says Secretary H. C. Haight of that concern. A new building has just been erected to be used exclusively for the manufacture of automobile springs and has been equipped throughout in a manner designed to meet the requirements of the most exacting designers for high-grade automobile springs. The company has carefully studied the use of vanadium steel, and springs made from this steel and other high-grade alloy steels will

be heated in special furnaces fitted with pyrometers and particularly designed for this work. A new testing machine has been added in this department, and improvements have been made in the fitting of springs, brought about by the purchase of a patented rolling machine exclusively used by the Cleveland-Canton Spring Company. The latter's plant has been running full time all through the recent commercial depression.

✓ At the annual meeting of the stockholders of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., the following directors were re-elected: H. H. Franklin, A. T. Brown, W. C. Lipe, E. H. Dann, G. H. Stilwell, John Wilkinson and F. A. Barton. After the stockholders' meeting, the directors re-elected the following officers: President, H. H. Franklin; vice-president, G. H. Stilwell; secretary, F. A. Barton, and treasurer, H. B. Webb. In the evening the stockholders of the company were entertained at the Century Club by Mr. Franklin. In speaking of the year's business he said that the company sold its first car in June, 1902, the total for that year amounting to \$122,000, while in 1907 the sales came close to the \$4,000,000 mark, and in spite of the financial stringency orders kept up well during November and December, though the first fortnight of January was dull, but picked up again immediately after, the third week of that month showing an increase of 29 per cent. over the total of the two weeks preceding.

Nearly one-third, or 199 out of the 727 cars of the 1908 model already delivered by the Packard Motor Car Company, have been equipped with limousine bodies. This is a remarkable demonstration of the growing use of the automobile as an all-the-year vehicle. It is an encouraging sign in the automobile trade that such a large portion of the Packard sales should have been of cars with inclosed bodies. The condition shows that people who are buying these cars expect to remain autoists and are buying for comfort, utility and style. Many of them have both touring and limousine bodies, as the Packard limousine is interchangeable with the touring car body on the same chassis. A peculiarity of this demand is the attention paid to the tastes and wishes of women. The modern limousine must not only furnish protection against inclement weather, but it must be a thing of beauty. Its appointment, to the smallest detail, must be above reproach. Even the ultra-fashionable horse-drawn carriage is no criterion; the buyer expects greater refinement in a new limousine motor car than in any horse carriage.

NEW AGENCIES ESTABLISHED.

Noblit & Fassett have succeeded Titman, Leeds & Company as Philadelphia agents for the Matheson and Pope-Hartford. The new concern has also taken over Titman, Leeds & Company's quarters, at the corner of Broad and Cherry streets.

During the present week the Bergdoll Motor Car Company will occupy its new three-story garage and salesrooms at the corner of Broad and Wood streets, Philadelphia. "Open House" will follow as soon as things can be whipped into shape. The Bergdoll concern handles the Welch, Imperial, Berliet and Benz cars.

Rose & Thompson, Incorporated, have purchased the interests of William H. Ulrich in the Yonkers (N. Y.) Auto Station, and have secured the sole agency in Westchester County for the Stearns, the C. G. V., and the Selden cars. The garage will be conducted in a thoroughly up-to-date manner, and a complete line of automobile supplies will be carried in stock.

The Wayne Automobile Company, Detroit, Mich., announces the establishment of 1908 agencies with the following houses: Frank A. Sanford, New York City; H. Francis Kane, Seattle, Wash.; Evans Motor Car Company, Minneapolis, Minn.; W. H. Demster Machinery Company, Kansas City, Mo.; Urch & Folsom, Ashland, Neb.; West Side Motor Company, Hamilton, O.; A. T. Wilson, Denver, Col.

The Factory Sales Corporation, 235 Randolph street, Chicago, has become the sales manager in the United States for the automobile devices manufactured by the Quincy, Manchester, Sargent Company, of that city. These devices are the Auto Clewrench and the Q. & C. Stanwood automobile step. George T. Briggs, who has been associated with the Quincy, Manchester, Sargent Company for the past four years, has identified himself with the Factory Sales Corporation.

The Witherbee Igniter Company, of New York, has just established a branch store at 720 Main street, Buffalo, for the sale of Witherbee batteries and Wico specialties, under the management of James Barkley. General Manager A. J. Fisk, who is now on an extended trip through the West, announces that it is the company's intention to establish a complete chain of branches, and that a more than ever vigorous advertising campaign will be mapped out by John B. Rowland, who will have charge of that particular part of the business.

PERSONAL TRADE MENTION.

Cornelius Barrows, who represented the Fiat in Philadelphia for several years, has been appointed manager of the Fiat department of the Girard Motor Company, of that city, which concern recently secured the local agency for the foreign car.

B. C. Day, manager of the Winton branch at Chicago, is a modest personage, notwithstanding the fact that he was formerly an advertising solicitor. The extent of his natural reticence will be understood when it is related that until the other day his employers did not know that he is the son of Rear Admiral Benjamin F. Day, U. S. N., retired, of Glasgow, Va.

Announcement comes from Orange, Mass., that the Grout Bros. Automobile Company is preparing to enter on the manufacture of cars on a large scale, under the direction of Russell Drisko, who has recently been appointed general manager. Mr. Drisko is a Boston man of wide experience in the automobile field, both as a salesman and a manufacturer. He was formerly manager of the Bay State Automobile Company, which built the Bay State Forty, and previous to that handled the Stevens-Duryea and the Queen, with the late F. F. Randall. He goes to the Grout plant with full powers, and his plans include the introduction of a number of new mechanical features.

INFORMATION FOR AUTO USERS

Reliable Priming Valve.—It frequently occurs that it becomes difficult to create sufficient suction when turning a motor over by hand, to cause it to start the aspirating nozzle of the carbureter, and to overcome this cause of trouble, J. H. Koontz & Company, Culver, Ind., are introducing an ingenious device which is adapted to be applied to the air intake of the carbureter, so as to shut this off

KOONTZ RELIABLE PRIMING VALVE.

temporarily when cranking. This is claimed to be superior to the method of priming by "tickling" the carbureter, as there is no tendency to flood or cause an overrich mixture, as it is possible to release the new priming valve the moment the motor starts. The details of this device as well as the manner of its application will be plain from the accompanying cut.

Brown Valve Grinder.—The object of this ingenious tool, the details of which are shown by the accompanying illustration, is to render the operation of grinding in valves easy and efficient, by saving time and making the work more satisfactory than is possible by make-shift methods. It is the product of the Brown Company, Syracuse, N. Y., who also make other specialties for the auto-

BROWN VALVE-GRINDING SET.

ist and repair man, and has been designed to be as simple and compact as possible, it only being necessary to remove the handle and the driver to pack it away in the tool box. In use the Brown grinder is held with the left hand, while a horizontal force is applied with the right, this imparting to the screw-driver, by means of a pinion and rack, a semi-rotary motion. Combined with the

grinder is the valve lifter, consisting of a heavy brass, helical spring, equipped at either end with a bearing and clamp fixture. To accommodate varying stem diameters the clamp is provided with two set screws, which when adjusted are left that way, the thumb screw being used for holding purposes. The only pressure required on the tool is that required to overcome the force of the lifter spring, the lifter being clamped to the valve stem before beginning the operation of grinding. The lifting action disintegrates all particles of compound previously rubbed on the valve faces and seat and introduces a factor of safety which makes the operation easy and certain for the veriest tyro. The Brown valve grinding set includes these tools and a box of special Brown grinding compound. The same firm also manufactures a handy compressometer for determining the compression of a motor. It consists of a well-made 100-pound gauge with a maximum hand that remains at the highest point of compression reached when turning the motor over. It is used by screwing into the cylinder in place of the spark plug.

Battery Power Gage.—The Hoyt Electrical Instrument Works, Penacook, N. H., who are the manufacturers of the combined type of voltmeter and ammeter for dashboard mounting on a car,

HOYT BATTERY POWER GAGE.

recently described in these columns, are now bringing out an instrument that they term a "Battery Power Gage" and which will be found of considerable value by every autoist who uses batteries of any kind for ignition, as it gives him a knowledge of the condition of the car's supply of current every moment it is in use. It is, in fact, a high resistance voltmeter, designed to be permanently connected in shunt on the low-tension side of the ignition system, that is, on one side to the wire leading from the battery to the coil box, and on the other to the ground, so as to bridge it across the battery and coil circuit. As soon as the switch is closed the gage indicates its condition as revealed by its voltage, and gives that indication continuously as long as the switch remains closed or there is any current in the battery. A broken connection would immediately be shown by the pointer dropping to zero, while a poor connection making contact but part of the time would be revealed by the fluctuation of the hand. The amount of life remaining in a set of batteries can also easily be determined, as a new dry-cell gives 1.2 volts, and the set of six will make the reading 8.1-2 or 9 volts. It is also applicable to storage cells, as the volt-

age is an even more certain indication of their condition. When this drops to 5 volts, it is time to discard the cells. Owing to its high resistance, the gage itself has no effect on the life of the cells. Its appearance may be judged of from the accompanying line cut.

Ruprecht Rectifier.—This is an alternating current rectifier of foreign make, of which the Auto and Supply Company, 406 Cuyahoga building, Cleveland, O., are the manufacturers' United States agents. The corrector is absolutely simple, as it has no winding or coils, makes no sparking or glare and is started or stopped merely by opening a switch. In case of current failure, the battery cannot discharge through the corrector, and the latter will immediately resume operations automatically upon the renewed flow of the current. The upkeep and attention required are practically negligible. The corrector consists of two poles, one of aluminum and the other of a composition metal, immersed in a chemical solution contained in a glass jar 5 inches in diameter. The poles are suspended from a slate top, which also carries all the connections. It is particularly designed for charging ignition accumulators, and as it has a capacity of 5 amperes, will recharge three sets of cells simultaneously.

RUPRECHT CORRECTOR.

Soda and Potash Kettles.—For quickly, thoroughly and economically cleansing oil, grease and chips from all sorts of newly made small parts, such as screws, nuts, bolts, gears and the like, it is customary to dip them into a hot, alkaline solution for a short time, and to make this process convenient and efficient the Gray & Prior Machine Company, 86 Suffield street, Hartford, Conn., make gas-heated kettles of the type shown by the accompanying illustration. The solution most commonly used consists of about half a pound of common washing soda per gallon of water, the

GRAY & PRIOR SODA KETTLES.

parts being cleaned by placing in a small perforated metal basket and then lowering into the hot solution. The first cost of these kettles is considerably lower than that of the steam-heated type, and they do not require any expensive auxiliaries or installation. The gas burner for supplying the heat consists of two concentric rings, supplied by independent gas cocks so that either may be used at will, the larger taking 15 cubic feet of

gas per hour and the smaller five, the latter being sufficient to keep the kettle hot. These kettles are listed in one size only, holding 10 gallons of solution. They will be found particularly adapted for the use of repair shops, garages and the like, where gasoline is usually employed for this class of cleaning, and will not only effect a great saving over such a method, but are far safer.

Auto-Marine Spark Plug.—This is a new plug, one of its distinctive features being an ingenious quick-opening and locking device, the operation of which will be understood at a glance upon reference to the accompanying illustration. It is being manufactured and marketed by Legnard Brothers, Waukegan, Ill., and a patent has been applied for to cover this as well as its other points of superiority. By merely giving the insulated handle forming part of the plug one-quarter turn it is possible to lift everything but the shell out of the cylinder, examine and clean the points, test and return to place with the motor running, without the need of tools and without any danger of shock. The ground taper fit and the locking device, con-

sisting of tapered cam shoulders, make it easy to take apart in this manner and still form a good, gas-tight joint. On old cars the Auto-Marine plug provides an easy way of priming the cylinders where there are no priming cups. It is made of special heat-resisting porcelain and non-corrosive wire which will stand a very high temperature without disintegrating or being otherwise affected. The plug was thoroughly tested out for a year in both air and water-cooled

motors before being placed on the market, so that the makers are confident that it will live up to every claim made for it, as no form of test that either the makers themselves could think of nor their friends or critics suggest was omitted in trying it out during that period. It is manufactured in all standard threads and sells for \$1.50.

The Le Python Horn.—This represents quite a radical departure from current designs in automobile horns, as will be apparent at a glance at the illustration. In place of the usual spreading bell mouth, which not only serves as a receptacle for dirt and flying particles, and which also offers such an area facing forward that the wind resistance at 40 miles an hour and over is in excess of that of the horn bulb, there is a small globe-shaped end situated within the spiral of the horn and perforated to permit the escape of the sound. No matter how fast the car travels, there is no back pressure on the bulb. Another feature of this horn is its peculiar, long-drawn-out tone, caused by the air passing through the gradual curves in the coils of the spiral. It can be readily

attached to the dash or side of the frame and does not interfere with the mud-guard or the raising of the hood, as it measures only three inches through.

LE PYTHON HORN AND BULB.

The bracket is so constructed that the horn complete may be instantly detached from the car for washing or similar purposes, although the design is such that it is next to impossible for water to get into it. The Le Python is of French manufacture and is being extensively adopted by foreign makers as part of the standard equipment of their cars. It is handled in this country by the Post & Lester Company, Hartford, Conn., who are exclusive agents for a large number of both foreign and American auto accessory specialties of different kinds.

Lipman Tank Gauge.—“It is a necessity, not a luxury,” say the makers of this new device, the Beloit Supply Company, of Beloit, Wis., and this is something with which

LIPMAN TANK GAUGE.

the average autoist will readily agree, as a convenient means of ascertaining just how much fuel there is in the tank at any given time, is something that is really needed on every car. The Lipman gauge is simplicity itself, as it works on the principle of displacing the air and thus has no moving parts of any nature. It may be placed above or below the tank level, or at either side, and only requires to be perpendicular. Connection to the tank is made by a flexible copper tube, which enters the tank at the top and extends to within half an inch of the bottom. As the gasoline rises in the tank it naturally does likewise in the tube, forcing the air in the latter into the bulb of the gauge, the pressure thus created forcing the liquid of the gauge upward in proportion to the depth of the fuel. As the latter recedes the indicating col-

umn of the gauge does likewise and always in the same proportion. Connection is made from behind, so that nothing shows on the dash but the gauge, as illustrated in the accompanying cut.

Protection Bumper.—Ever since the present type of car came into vogue the necessity for something that would prevent the radiator and headlights from feeling the effects of contact with suddenly backed wagons, other machines in the garage and similar accidents, has been apparent to every autoist. To meet this demand, J. H. Sager & Company, Rochester, N. Y., manufacturers of the well-known Sager equalizing springs, are now placing on the market a simple and ingenious device known as the “Protection Bumper,” the arrangement of which will be apparent from the accompanying illustration, showing it ready to put on a car. The attachment is practically universal, as it is made adjustable and thus can be ap-

SAGER'S PROTECTION BUMPER.

plied to any car without trouble. It will be evident that it not only serves as a protection to the lamps and radiator, but also prevents a pedestrian getting under the wheels of the car. The Protection Bumper is made in two styles, black and brass, the former being designed to be painted to match the finish of the car. The latter is not a brass-plated tube, but is made of steel-lined brass tubing. The arms holding the tubing are raised to give extra protection and are made of special metal, highly polished. The rear ends of the arms rest upon two coiled springs encircling the lower end of an L-shaped stud bolt, securely fastened to the frame. These springs absorb the shock of a collision without damage to the bumper or the car.

Acetylene Signs.—An extremely attractive form of night and day sign adapted to be lighted by acetylene gas has just been perfected and placed on the market by the Avery Portable Lighting Company, 18-22 Martin street, Milwaukee, Wis. It is equipped inside with two small acetylene burners which are supplied with gas through a small pipe attached to the bottom of the sign. The latter can be attached to the back of the car or to the radiator, by means of screws, it having been designed particularly with this in view, being a substitute for the tail-light when placed on the rear. The pipe line leading from the Autogas tank to the headlights can be easily tapped and an additional connection made with a pipe line leading to the sign; the front of the latter is made of stained glass, the lettering being white on a red background, the letters being about two inches high, so that they are plainly visible by day. The night effect is striking.

THE AUTOMOBILE

LONG ISLANDERS HAVE CONVINCING ECONOMY RUN

OUT of twenty-three automobiles participating Tuesday, February 25, nineteen finished the Mid-winter Economy Run of the Long Island Automobile Club, from Brooklyn to Amagansett Bay and return, distance 234 miles, in the time limit of eighteen hours. Of the four failing to come up to the reliability standard, one, the Lozier, driven by David Mahaney, was wrecked as the result of skidding on a blind turn. Three only were eliminated by mechanical trouble. Considering the condition of the roads, the reliability of the contestants was excellent, many of the cars finishing five to seven hours before the time limit after a run unmarked by much incident.

Which of the nineteen is the best car remains to be determined. Reliability is only a qualifying condition. The winner, on the club's basis of selection, is the car having carried its load at the lowest cost per head for fuel and oil. To determine this the contents of the tanks must be measured with care. It is not a difficult operation, but is one that should be carried out conscientiously, and the club officials preferred Wednesday to delay the announcement rather than risk any mistake in their calculations.

Competition for the three trophies will be keen.

Certain of the drivers declare they have covered the 234 miles on eight gallons of gasoline and less than a quart of oil. The cost by railroad from Brooklyn to Amagansett Bay and return is \$5.28 on an ordinary ticket and \$4.20 with a mileage ticket. Taking the consumption of the most economical cars at ten gallons of gasoline and two quarts of oil—the probabilities are that it will be lower—the total fuel cost for transporting five passengers a distance of 234 miles works out at \$3, or 60 cents per head.

At 6 o'clock Starter Wagner sent away the first of 23 competitors, a single-cylinder Cadillac piloted by Joseph D.

Rourk. A few minutes later Claud Hosley drove a 20-horsepower Maxwell over the line, and at odd intervals the remainder of the competitors followed, the last to leave being a six-cylinder Winton. They were a representative lot of American cars, comprising such makes as Pope-Hartford, Hol-Tan, Lozier, Franklin, Haynes, Acme, Cadillac, Pullman, Mora, Studebaker, Rambler, American Mors, Maxwell, Frayer-Miller, Winton, Stevens-Duryea, Thomas Detroit, and Buick.

Land's End to Land's End, the extremities being Brooklyn and Montauk Point, had been the original route. On measuring up the distance, however, it was found that 234 miles would be covered if the cars stopped short at Amagansett Bay, and in the interests of all it was decided to cut off the run to the end of the narrow strip of land with Montauk Point as its appendix.

The previous evening every car entered for the run had been given a measured supply of gasoline and lubricating oil, verified by an observer from a rival car, supplied with a set of cards on which were to be recorded its passage at the outward checking stations, starting and finishing time, and fuel and oil used. Therefore, when the start was

given, all that the driver had to concern himself about was reaching Amagansett Bay and returning to the clubhouse that evening by 9 o'clock with the least amount of consumption of gasoline and lubricating oil. The winner would be the car having taken its passengers over the 234 miles with the least cost per passenger, fuel and lubricating oil at 25 cents and \$1 per gallon alone being taken into account in making awards.

Looked at critically, there is some reason for objection to the basis on which the awards were made, for every type of car had to operate under the one general rule, and though each carried its full quota of passengers according to cata-

MAXWELL PASSING BABYLON, FIRST CHECK ON LONG ISLAND RUN.

PHOTOGRAPHING EARLY START WAS MOST DIFFICULT.

logue specifications, there was a great amount of variety. Thus the little single-cylinder Cadillac, the lowest-powered car in the test, had four persons on board; a big six-cylinder Acme, with more than four times the horsepower of the one-lunger, being fitted with a runabout body, also carried but four people. A small Buick, with open touring body, carried five people; an elegant American Mors with limousine body and windshield also had to divide its fuel and gasoline cost by five. With an icy breeze blowing across the unprotected island, there was no doubt as to which car offered the better method of travel; it was equally certain which, under ordinary conditions of operation, would have the heavier costs account.

Though recognizing that there were inequalities in the system on which awards were based, the committee believed that the wintry weather would tend to even up chances. With a heavy layer of snow on the ground and some rough going at the eastern end of the island, there were likely to be some cases of elimination from mechanical difficulties, and the heavily loaded, powerful cars were likely to see their gasoline supply diminish at an unusually rapid rate. As an object lesson on reliability and a demonstration of the cost of automobiling under ordinary winter conditions the run was of the highest value. The thoroughly earnest and businesslike manner in which every detail was attended to by the club officials served to enhance that value.

With but one or two exceptions every car taking part in the run was identical with those sold daily to the public or used by owners for ordinary touring. Though economy was the criterium, few thought it necessary to make any changes on their carbureters or to add the auxiliary air inlet which usually plays such an important part in limited fuel tests. A box on the running board for lubricating cams, and one more

CHECKING AT BABYLON—FRANKLIN IN FOREGROUND.

spare tire than is usually carried was the extent of the change on the majority of the cars. Hugo C. Gibson, the English expert for the Selden interests, was the object of numerous questions concerning a modified radiator surmounted by an ordinary house radiator escape cock, and a gasoline gauge projecting through the bonnet of the car.

On the outward run to Amagansett Bay each car had to report to the four checking stations; but when the easterly point had been reached the run home could be undertaken over any road the driver preferred. Instead of the usual type of checking card to be signed in a space provided, each card had a combination set of figures on which any hour and minutes could be punched. The same system was adopted on the gasoline and fuel cards. Time spent on the road and between checking stations in no way entered into the consideration for awards, the only time provision being a return to the clubhouse at 9 P. M., no cars being checked in before that hour, and no account taken of arrivals after midnight.

What Occurred on the 234-Mile Journey.

Road conditions were such as to make the test of real value in proving the economy or otherwise of an automobile. While slightly worse than the average likely to be met with in a year's touring through the Eastern States, conditions were not so bad as to rob the run of value as an economy demonstration. On the outward trip the surface was generally hard and rutty, with but a small amount of snow.

TROPHIES FOR THE SUCCESSFUL PARTICIPANTS.

When the homeward run was commenced the thaw had softened the surface so much that there was a considerable amount of lost traction and drivers had not always an easy task in keeping their cars on the road.

The greasy surface was partly responsible for the only serious accident of the day. After checking in at Southampton, No. 20 Lozier, driven by David Mahaney, unexpectedly found an express wagon blocking the road on a blind curve. To avoid a collision the automobile driver swerved suddenly, ran on the sidewalk, crashed into a telegraph pole, smashed both left wheels and bent the front axle. The passengers suffered nothing worse than a shaking. Mahaney telephoned to New York for wheels, but was unable to finish within the time limit.

Before noon No. 5 Haynes, driven by W. E. Shuttleworth, retired from the contest with a broken rear axle. Hugo Gibson's Buick dropped out of the competition as the result of the collapse of the patent wheels which the owner was experimenting. An effort to obtain a perfect set from New York was not successful. The Hol-Tan runabout, driven by Neilson, developed differential troubles on the outward run, was reported to be in further difficulties on the way home, and had not appeared at the garage at the closing hour, Tuesday midnight. For a time it appeared as if the little single-cylinder Cadillac would be eliminated, a broken wheel having caused it to lose a considerable amount of time. At 10:30, however, it reported at the clubhouse, and was consequently entitled to enter with the others for the economy classification.

Ideas differed on the method of driving in an economy competition. Half a dozen rushed over the course at such a speed that they were back in Brooklyn at 4 o'clock. Three cars, a six-cylinder Acme, a Thomas-Detroit, and a Stevens-Duryea, had entered the garage before 5 o'clock. C. S. Arnold's Pope-Hartford, a Lozier, Pullman, two Acme cars and a Mora had finished the run shortly after 6 o'clock. The early finish benefited them nothing, no official recognition of arrival being made before 9 o'clock.

Among those who believed that slower travel would reap its reward in the final classification were the drivers of the Frayer-Miller and the Franklin, the only air-cooled candidates. It was almost 9 o'clock when the couple entered the garage together and set circulating stories of the journey having been covered on less than eight gallons of gasoline. The two small Maxwells followed the same slow and sure policy. The American Mors, a big, comfortable-looking limousine, which had carried its load of five in luxury and without a hitch, was one of the few high-powered cars to arrive after 9 o'clock. H. A. Martin accepted a heavy handicap when he undertook to drive a limousine in competition with light touring cars, but he certainly gave his passengers the most enjoyable trip of the day.

The first prize is a handsome imported bronze of an Indian girl on a marble pedestal, valued at \$200. Second prize consists of a well executed bronze of a lion and a lioness, valued at \$100, and the third prize, a sterling vase with heavy floral decorations, its value being \$50. About 60 per cent. of the entry fees were expended by the committee in prizes, the remaining 40 per cent. being for necessary expenses attached to the organization of the run.

The energetic contest committee, consisting of A. R. Pardington, chairman; C. G. Arnold, F. D. Bandell and Secretary Russell A. Field, was ably assisted by the following staff of officers: Referee, Jefferson DeMont Thompson; judges, F. G. Webb, Alfred Reeves, Dr. C. B. Parker; judges of gasoline, E. L. Ferguson, L. T. Weiss, A. C. Alderman; judges of lubricant, H. L. Towle, R. H. Johnston, A. F. Camacho; judges of observers, W. R. Lee, W. C. Colson; judges of passengers, A. W. Blanchard, R. G. Howell; timers, C. J. Dieges, V. Clust; starter, Fred Wagner; checkers, L. M. Bradley, M. C. Reeves, K. S. Arnold, J. E. Goey.

RENAULT TAXICAB SERVICE IN NEW YORK.

Paul Lacroix, general manager Renault Freres Selling Branch, New York City, announces that about March 10 he will take possession of the new six-story building, Nos. 214-216 West Sixty-fifth street, especially built for the sole use of the Renault garage, spare parts, and repair shops, and Renault taxicab department. The garage will be for the use of Renault owners exclusively. Mr. Lacroix states that it will be as complete in every detail as any of the Renault Paris garages and will be conducted on similar lines with the French workmen. New York is soon to have a Renault taxicab service.

MANY PERFECT SCORES IN BAY STATE RUN

BOSTON, Feb. 22.—Twenty cars competed in the endurance run to-day of the Bay State Automobile Association, and of that number fourteen—ten touring cars and four runabouts—not only finished the road test with perfect scores, but successfully passed the examination of the technical

Stevens-Duryea No. 15, entered by the J. W. Bowman Company and driven by J. W. Robinson, was penalized eight points for four minutes spent near Providence in adjusting a fan belt. The Thomas Detroit, No. 3, entered and driven by J. S. Harrington, was penalized five points for stalling the motor at the start of the last stretch of the run. The Springfield, No. 4, entered by the Harry Fosdick Co. and driven by L. D. Robbins, had trouble with the steering gear, but was repaired and was able to return to Boston under its own power. The Knox, No. 8, entered by the Knox Automobile Company and driven by A. E. Dennison, was obliged to discontinue because of trouble with the rear axle, while the Winton, No. 9, entered by the Winton branch and driven by L. B. Harris, was delayed by a gasoline feed pipe which caused bother.

The weather and road conditions, considering the time of year, were excellent. Overhead the sun shone brightly all day long and there was just enough bite in the air to make a fur coat feel comfortable and not enough chill to prevent the observers and other passengers thoroughly enjoying the trip of about 135 miles

from Boston to Providence, Providence to Worcester and Worcester to Boston. The snow and ice left by the storm earlier in the week had made the highways rather rough, but they were much better than many of the drivers anticipated, and the rough ice was better than the soft snow and mud that prevailed earlier in the week. The contest committee, expecting bad road conditions, had made a slow schedule, but once the run was started it was found that the cars were having so easy time in keeping their schedules that the runs between controls beyond Providence were shortened considerably.

IT WAS EARLY IN THE MORN WHEN THE CARS STARTED FROM BOSTON.

committee without having any black marks scored against them. The perfect score cars were as follows:

- No. 1—Marmon, entered by F. E. Wing, driven by F. E. Wing.
- No. 2—Thomas-Detroit, entered by the Whitten-Gilmore Co., driven by Charles E. Whitten.
- No. 5—Studebaker, entered by Studebaker Automobile Co., Boston branch, driven by Walter Jones.
- No. 6—Atlas*, entered by Harry Fosdick Co., driven by W. E. Ruggles.
- No. 7—Knox, entered by Reed-Underhill Co., driven by William Bourque.
- No. 10.—White, entered by the White Co., driven by H. K. Sheridan.
- No. 11—White, entered by The White Co., driven by Walter White.
- No. 12—Thomas Flyer, entered by J. S. Harrington, driven by A. H. Dorsey.
- No. 13—Reo*, entered by Linscott Motor Co., driven by F. H. Pratt.
- No. 14—Austin*, entered by I. N. Litchfield, driven by J. C. Kennedy.
- No. 16—Lozier, entered by H. C. & C. D. Castle, driven by Harry Michner.
- No. 17—Oldsmobile, entered by Algonquin Motor Car Co., driven by J. H. Hobson.
- No. 19—Rambler*, entered by V. A. Charles, manager for Thos. B. Jeffery & Co., driven by E. W. Williams.
- No. 20—Franklin, entered by Franklin Automobile Co., driven by Theodore Young.

Of the six cars which failed to make perfect scores, three finished with penalties and three dropped out. Of those which finished, the Rambler touring car No. 18, entered by V. A. Charles and driven by him, was penalized four points for two minutes delay in adjusting a needle valve. The

*Runabout.

AND IT WAS DUSK OF EVENING WHEN THEY WERE CHECKED IN

The lot of cars which left the clubhouse of the Bay State Automobile Association at one minute intervals after 7:01 A. M. was a most representative assortment, and the fact that fourteen successfully completed the run in good condition speaks much for the advance that has been made by the industry. A year or two ago the fact that a car was able to cover the triangle at all, to say nothing of keeping on a schedule and being subjected to a trying examination by a committee of technical experts, would have been recommendation enough. The entries represented almost every shade of opinion among automobile designers and manufacturers. Among them were air-cooled and water-cooled cars, two, four and six-cylinders, tourers and runabouts, two and four-cycle motors, vertical and V motors, small, medium and high-priced vehicles. And nearly every variety was represented among the perfect score machines, a fact which is commendatory to the American industry as a whole.

The drivers, too, represented varying shades of experience. There were Walter White and Hal Sheridan, veterans of many a tour and endurance run, one of them the winner of the Hower trophy in last year's A. A. A. tour.; F. E. Wing, who drove a Marmon air-cooled car with a perfect

ONE PERFORMER WAS A "BIG SIX" THOMAS.

of the contest is in large part due to its efforts, as well as to the high quality of the cars entered and the skill of the drivers.

There were five controls in the course of the run. The first was at Walpole on the way to Providence, and the second in the city of Providence. A stop of forty minutes was allowed in Providence, and the Rhode Island Automobile Club extended every possible hospitality to the contestants and those who accompanied them. Between Providence and Worcester the first control was at Uxbridge, and the second at Worcester, and there the Worcester Automobile Club kept open house for the visitors during the short stop for luncheon. An unusual incident happened in Worcester and Arthur Knights, the confetti carrier, came near getting into trouble with the United States postal authorities. While he was passing through the city Postmaster Hunt noticed that the bags from which the confetti was being thrown were United States mail bags. He stopped Mr. Knights and warned him that he was committing an offense against the Federal laws in using mail bags for that purpose. Mr. Knights explained that the bags were given him by the party that provided the confetti. Postmaster Hunt advised him to leave the bags in Worcester, which he did, transferring the confetti to some potato sacks.

The only control between Worcester and Boston was at Wayside Inn, and from there the roads to Boston were excellent, and Mr. Wing with the leading car checked in exactly on time at 4 o'clock in the afternoon. As rapidly as the cars arrived they were taken into the White garage on Newbury street and placed at the disposal of the technical committee. Pending the report of the committee the competitors and the passengers, with the exception of Mrs. J. S. Harrington and Mrs. E. M. Dodge, the only women to make the run, awaited the final returns at the Bay State clubhouse.

ROUTE OF THE BOSTON 135-MILE ENDURANCE RUN.

score in the Glidden tour in 1906; Fred Pratt, whose performance with the little Reo won him praise from his competitors equipped with much larger and more powerful machines; A. H. Dorsey, whose Thomas Flyer was the same that recently made the snow ploughing trip from Buffalo to Boston; and others of much less experience, who nevertheless handled their cars with equal skill. Every driver made each of the controls on time, the penalties being inflicted by observers.

The last car was sent away at 7:21 A. M. Ahead of the contestants Arthur Knights with his Oldsmobile scattered a trail of confetti and J. W. Maguire, with a six-cylinder Pierce Great Arrow, carried out the checkers. Behind the contestants Henry S. Johnson with a six-cylinder Premier, Manager Kilbourne with a six-cylinder Franklin, and A. E. Morrison's Wayne took care of the officials and newspaper men and picked up the checkers as soon as all the cars had passed their stations. The committee, consisting of John C. Kerrison, chairman; Ernest A. Gilmore, of the Whitten-Gilmore Company; Alfred N. Robbins, of the Harry Fosdick Company, and Col. Horace G. Kemp, did excellent work in preparing for the run and carrying it through, and the success

WALTER WHITE CHECKING IN AT PROVIDENCE.

BAY STATERS: ROBBINS, KEMP, KERRISON, AND GILMORE.

It was 9:30 o'clock in the evening when the technical committee made its report. It stated that after carefully examining all the cars it had been unable to find any cause for changing the results as shown by the road test. This was a most satisfactory finish for the contest, and, as a majority of the drivers and entrants of the perfect score cars opposed an attempt to run off the tie, it was decided not to hold another contest to break the tie and to award certificates to all the cars which had made perfect scores.

DETROIT AGAIN HEARS MACHINERY'S MUSIC.

DETROIT, Feb. 24.—There is music in the air, and it is not the distressing strains of a dirge either, so far as local automobile manufacturers are concerned. On every hand there are evidences of activity in anticipation of what the coming season will bring forth. A portion of this optimism is based on results at the show just closed, but makers are banking largely on conditions as revealed by a careful canvass of the trade in general.

Two months ago scarcely a wheel was turning in the local automobile factories. This was not wholly unexpected, for the early winter months are always quiet.

YORK COMPANY ENTERTAINS PRESS MEN.

YORK, PA., Feb. 26.—The York Motor Car Company, manufacturers of the Pullman automobile, entertained the sporting writers and automobile editors of the Philadelphia, Harrisburg and York newspapers at a banquet last night. Every newspaper in these cities was represented, and L. E. French, the Philadelphia agent for the company, acted as toastmaster. The owners of the plant were in attendance and responded to toasts, as did several of the "pencil pushers."

CHECKING IN THE BUNCH OF CARS AT PROVIDENCE.

NEW YORK-PARIS MEN FIGHTING WITH SNOW.

That endurance run to Paris, which everybody persists in calling a race, has descended to such a low rate of travel that whatever element of speed there may have been in it at the commencement has now been removed. When Montague Roberts, who has throughout maintained the lead on the Thomas car, reached Toledo at the end of the seventh day, it was supposed that he would be in Chicago 48 hours later. He made a splendid exhibition on the run to Kendalville in the face of a snowstorm, but since then has had a terrible struggle with Indiana snowdrifts. After four successive days in which the mileage was 17, 42, 24 and 11, Roberts hitched his car onto the Lake Shore tracks and ran into Chicago under his own power, arriving at the automobile clubhouse at 4:25 P. M. on Tuesday, February 25, having covered the first 1,043 miles in 13 days, 6 hours and 10 minutes. On Thursday he will leave for Ogden.

The De Dion, as the result of a broken driving shaft, fell behind the American car on the eighth day of the run and had not been able to make up the difference on the thirteenth day. For a time the Italian Zust was second in the trail, but by the time North Carlisle, Indiana, was reached the Frenchman had rejoined the Italian and was but five miles behind

THOMAS SURMOUNTING THE INDIANA SNOWDRIFTS.

the American. So heavy are the snowdrifts that a track cleared for the leading car is of no assistance to the others following a few hours later, every team being obliged to work constantly with shovels, horses and plows to clear a track through the deep snow. The slower German Protos and French Motobloc have closed up somewhat on the leaders, but unless weather conditions change quickly will again lose their advantage in the deep snowdrifts of Indiana. The mileage of the five cars from the seventh to the thirteenth day, inclusive, is as follows:

Car.	Nation.	6th day	7th day	8th day	9th day	10th day	11th day	12th day	13th day
Thomas (American)...		566	785	891	904	921	963	987	998
De Dion (French)....		566	756	888	895	895	895	921	963
Zust (Italian).....		543	667	854	881	895	912	949	963
Protos (German).....		471	566	613	617	725	817	865	888
Motobloc (French)....		352	471	548	613	693	785	854	881

STUDEBAKER COURIER CAR REACHES CHICAGO.

CHICAGO, Feb. 25.—The Studebaker car carrying the war message from New York City to Fort Leavenworth reached Chicago at 4:20 P. M. to-day shortly in advance of the first New York-Paris racer. Since leaving New York the car has been handled by three shifts of drivers, working eight hours on a stretch, and the intention is to make the journey in as short a time as possible under the adverse conditions now prevailing. The car is standing the journey exceptionally well. Its equipment includes anti-skid Continental tires.

SIX NATIONS TO PARTICIPATE IN GRAND PRIX

PARIS, Feb. 15.—Thirty-seven powerful racers, carrying the colors of France, America, Germany, Italy, Belgium and England, are already officially engaged to compete in the French Grand Prix at Dieppe, July 7. Twenty-four hours remain in which further entries may be received at ordinary fees, and there is a possibility of half a dozen late comers handing over half a dozen thousand dollar fees before Secretary Sautin raises the rates. The feature of the entry list is the comparatively low French representation. Several

tice the changing of wheels is forbidden; this so angered Edge, who has used detachable wheels exclusively in his 1907 track racing, that he accuses his neighbors of unsportsmanlike practices and refuses to race on their terms.

Ten rounds of the 77-kilometer circuit will have to be covered by the Grand Prix racers and 6 rounds by the Voiturettes. This will give a total distance of 478.4 miles for the powerful cars and 287 for the small racers. As practically all the drivers have had some experience on the course, there has not

been the same wild rush to the Dieppe course that usually marks the selection of a circuit. Road tests of the actual cars to be used in the Grand Prix have already begun, the Renault team leaving for Dieppe this week and Gabriel and Rigal of the Bayard-Clément factory being already on the course. The ex-Dietrich driver has one of the 155-millimeter cars; his companion is piloting one of the fastest machines of last season, the object being to test the two side by side on the road. From the reports of the drivers the surface of the course is in excellent condition after the winter storms and will not call for much labor to put it into first-class racing trim. It is intended, however, to remake all weak spots and thoroughly retar.

As an instance of the thoroughness with which preparations are being made for the race, the Bayard firm has built two series of cars, one set with a stroke of 6.6 inches, the other with 7.2 inches stroke. Bore in each case is the maximum of 155 millimeters, all other structural features being identical. Unless the British Napier team is entered it is certain that all machines will be of the four-cylinder four-cycle type, and all with the exception of the American will have the maximum bore of 155 millimeters. As last year, the Panhard engines will probably be tried out on Monaco motor boats before being put on the racing chassis.

It would appear that no firm will take advantage of the

GABRIEL READY FOR ROAD TESTS ON BAYARD-CLEMENT RACER.

firms more or less consistent in speed contests in the past have restrained from racing this year. Darracq, hitherto irrepensible where records were at stake, will be a mere spectator on the Dieppe course. His abstention is declared to be due to the fact that the big factory on the banks of the Seine is now largely under British control, the directors from across the Channel not being as keen on building flyers as the man who sent Wagner over the Atlantic for the Vanderbilt Cup. It is an open secret that the withdrawal of Darracq cars from official participation in last year's races was due to British influence on the board of directors. Hotchkiss will not line up; Henri Brasier, though taking a keen interest in the race, is not certain to hand over the necessary fee allowing him to run three cars; Gobron, Mors, and C. G. V. are other large firms which will not be represented.

As the list stands at present, France has 15 cars against 22 for all other countries, individual figures being Germany 9, England 6, Italy 3, Belgium 3 and America 1. There are still hopes that S. F. Edge will come into line and increase the British representation by three Napiers. For weeks a wordy battle has been waged between the militant Englishman and the leaders of the French club on the use or non use of detachable wire wheels in the Grand Prix. Following previous prac-

BAYARD-CLEMENT ENGINE PRODUCED UNDER NEW INTERNATIONAL RULE.

special opportunity to race two-cycle cars against those of the four-cycle type under the maximum bore rule. Those firms having studied the two-cycle engine seriously have failed to be moved by the offer of the Racing Board.

The full list of entries a few hours before the official closing is as follows:

Race of Little Fellows Day Before Grand Prix.

Being almost entirely confined to French cars, the Voiturette race to be run the day preceding the Grand Prix will not arouse much international enthusiasm, though home constructors are busily discussing the possibility of high speeds with the 3.9-bore single-cylinder racers. Twenty-four cars are now entered, all French with the exception of the Isotta-Fraschini team of diminutive four-cylinder racers. The Italian firm is also the only one to build four-cylinder cars under the Voiturette limited bore rule. A few of the French firms may put in two-cylinder cars, and one house at least will enter a two-cycle engine, but the large majority will present four-cycle, single-cylinder engines of 3.9 inches bore.

TAXICAB, ALCOHOL AND ENGINE TESTS.

PARIS, Feb. 17.—Taxicabs, motors running on alcohol, and high-powered engines are each to be provided by a public competition through the efforts of the Automobile Club of France. The taxicab event, to form a part of the industrial vehicle competition of the A. C. F. in May, will provide for engines of 3.9 bore for a single cylinder and a four-cylinder of 3.1 inches bore. Maximum weight, with passengers on board and tanks filled, is fixed at 2,200 pounds for the smaller cars, the proportion to increase with cylinder area. Maximum and minimum speeds are to be 9 and 18 miles an hour. After a preliminary endurance test the survivors will be classified on a ton-mile fuel consumption basis, denatured alcohol to be used exclusively.

In connection with the Anti-Alcoholic League, the A. C. F. technical committee will hold a power and consumption test for all types of motors using denatured alcohol. The competing engines must undergo a six-hours' test under full load, three hours under half load, and three hours running free. Lowest consumption and highest power developed will determine the winner. The teetotal league gives a \$400 prize and a private supporter another of \$1,000.

The third competition is for internal combustion engines of any type, horsepower to be not less than 24 nor more than 80. Weight of the engines must not exceed 8.8 pounds per effective horsepower, all accessories connected with the motor to be included. The average power developed under a three hours' test with full load will determine the winners. Engines must be run light 15 minutes before load test.

MOUNTAIN SPEED TRACK FOR FRENCH CLUB.

PARIS, Feb. 17.—A permanent course to be used for all races and touring contests in France has again been brought up for discussion by the departure of a delegate of the Automobile Club of France to study a track in mountainous Auvergne. As at present proposed, the scheme provides for the cutting of two parallel roads around the steep slopes of the Puy-du-Dome, over a part of which the Gordon Bennett race was run in 1905. The two ring roads, united at one point, give a total distance of 24 miles along the flank of the mountain. All the land in the neighborhood of the course is of a volcanic origin unsuited for cultivation. There are no cross roads whatever, and although a local railroad crosses the proposed course it will in no way interfere with the speed track, for the rails will be carried either over or under the road.

It is proposed to construct a double track of a total width of 78 feet, divided in the middle by a low barrier and fitted with central electric lamps at distances of 100 yards. Each track will be curved, have a gutter for carrying away the water at the inside and the outside and be protected by a high banking and a fence four feet in height. Grandstands erected within the course will be reached by the track railroad. It is estimated that the total cost of constructing the course will be \$400,000. This sum will include the electric lighting station, power for which will be obtained from a mountain stream. The land being of very low value, it is not supposed that there will be any difficulty in obtaining a right of way. Clermont-Ferrand, but eight miles distant, is the home of Michelin and other important tire manufacturers.

ECONOMIC SUGGESTIONS FOR PARIS SALON.

PARIS, Feb. 17.—If the Federation of Cycle and Automobile Manufacturers, of which M. Darracq is president, could have its way, there would be no Paris Salon this year, that body considering an exhibition every two years quite sufficient for the industry. As the Federation is only one of three bodies responsible for the holding of the show, and is in a minority on the period question, it will content itself with suggesting economic reforms. The Salon, it declares, should not continue more than ten or twelve days; the competition for decoration of stands should be abolished; fifty per cent. of the net profits should be distributed among the exhibitors in proportion to the amount paid for space; there should be no increase in the price for space. Finally, the date they consider most suitable for the show is the first fortnight in December. There is a consensus of opinion that a good show can be held without lavish expenditure of money.

ZEPPELIN AIRSHIP TO BE BOUGHT BY GERMANY.

BERLIN, Feb. 10.—At the recent meeting of the Budget Commission of the Imperial Diet, it was resolved to grant the demanded sum of 400,000 marks for aerial motor tests and to acquire the airships built by Count Zeppelin for the sum of 2,150,000 marks. Aerial motorism has found a great supporter in the German nation, as all parties were at one on the point of the desirability of furthering its progress to the utmost.

The Swiss Aero Club has resolved to enter two balloons for this year's Gordon Bennett of the air.

VICHY OFFERS \$4,000 FOR AERO PRIZES.

PARIS, Feb. 17.—Four thousand dollars are promised as cash prizes for an aeroplane competition that the Aero Club of France will organize at Vichy next September. The tests will be held, in all probability, on the Vichy racecourse. To cover the expense of transporting the flying machines to Vichy an allowance of \$200 will be made to every person taking part in the contest. Entries close July 15.

PROBLEMS IN THE REPAIRING OF AUTOMOBILES*

By THOS. J. FAY, E.E., PRES. SOCIETY OF AUTOMOBILE ENGINEERS.

THUS far, the vanadium chrome steel exposed to view presented a very nearly even chemical composition; that the composition is usually readily distinguishable without difficulty in the micro-photograph, will be seen by an inspection of the micro-photograph, Fig. 8, the data of which is as follows:

Magnification 350
 Etching..... Deep
 Condition... Normal
 Metalloids... Low
 Carbon..... 16 points
 Vanadium... 0.16%
 Chromium... 0.30%
 Process..... Basic
 Structure... Characteristic

FIG. 8.

As will be observed, this specimen is one of very low chromium, and with a decreased vanadium content, with the further characteristic of low carbon. This is obviously a "cementing" (case-hardening) fabric. The effect of cementing on the product such as this will be found in Fig. 9 (core of the cemented section), the data of which is as follows:

Magnifications..... 350
 Etching..... Deep
 Condition..... Cemented
 Metalloids..... Low
 Carbon..... 16 points
 Vanadium..... 0.12%
 Chromium..... 0.30%
 Process..... Basic
 Structure..... Coarse

It might be well to show, by comparison, in so far as it will be possible to do so, the influence of these small increments of vanadium and chromium on the micro-structure, using for the comparison a micro-photograph of acid open-hearth steel. Fig. 10, which is an excellent exam-

FIG. 9.

FIG. 10.

ple of the material in question, is offered with that end in view, the data of which is as follows:

Magnifications..... 350
 Etching..... Deep
 Condition..... Annealed at 800° C.
 Metalloids..... Low
 Carbon..... 25 points
 Process..... Acid Open Hearth
 Structure..... Characteristic

It would be possible to give many illustrations of the effect of vanadium in conjunction with chromium on steel, and to comment at some length upon the service to be expected. The scope of this article does not demand further effort in this direction, and it will be well to give to chrome nickel steel its measure of attention. That the chrome nickel steel looks better in the micro-photographs is to be expected, since the same steel tests better in practice. The extent of the improvement depending upon the care and the process in the fabrication of the steel. This is provided the ores used are of the desirable grades.

The first of these grades of steel to be taken up here will be one from a *special heat*, at the instance of the author, in which Wolfram was substituted for nickel. This steel is of excellent qualities, and the micro-photographs will show a considerably settled uniformity for this and the specimens (this is Fig. 11). Figs. 12, 13 and 14, each of them taken at high magnifications. The data of the chrome Wolfram steel, Fig. 11, is as follows: (Work done by Robert W. Hunt & Company.)

Magnification..... 1200 diam.
 Objective..... 1/4"
 Eye-piece..... 1"
 Exposure..... 1/2 min.
 Plate..... Cramer contrast
 Light..... Electric Arc
 Development..... Ferrous oxalate
 Etching..... 40 sec.
 Etching solution..... 10% HNO₃ in absolute alcohol
 Iris diaphragm on microscope stopped down two-thirds.

CHEMICAL COMPOSITION

Chromium..... 1.44%	Silicon..... 0.0197%
Nickel..... None	Sulphur..... 0.033%
Wolfram..... 0.952%	Phosphorus..... 0.011%
Carbon..... 0.318%	Manganese..... 0.29%

FIG. 11.

The micro-photographs, Figs. 12, 13 and 14, were made in substantially the same way, in the same laboratory; hence it will not be necessary to repeat all the details in the discussion thereof. Fig. 12 is of Krupp chrome nickel steel, the regular brand E. F. 60-0, the data of which is as follows:

Magnifications..... 1,200 diam.
 Etching..... 50 sec. (light)
 Condition..... Normal
 Metalloids..... Low
 Carbon..... 25 points
 Chromium..... 1.69%
 Nickel..... 4.40%
 Process..... Acid
 Structure..... Not defined

Fig. 13 is of "Bischoff" chrome nickel steel (soft), the data of which is as follows:

FIG. 12.

Magnifications..... 1,200 diam.
 Etching..... 45 sec.
 Condition..... Normal
 Metalloids..... Low
 Carbon..... 26 points
 Chromium..... 1.10%
 Nickel..... 3.69%
 Process..... Crucible
 Structure..... Not defined

*Continued from page 243, THE AUTOMOBILE, issue of February 20.

Fig. 14 is of a fine American brand of chrome nickel steel, "Midvale," the data of which is as follows:

Magnifications.....	1,200 diam.
Etching.....	30 sec.
Condition.....	Normal
Metalloids.....	Low
Carbon.....	30 points
Chromium.....	1.23%
Nickel.....	3.60%
Process.....	Midvale
Structure.....	Not defined

FIG. 13.

Here we have, then, three standard grades of chrome nickel steel, all treated in the same way in the same laboratory, with the same skill, magnified to the same extent, and they look so much alike as to render the difference not apparent to the unskilled eye, to say the least. This is due primarily to the fact that the several products are very much alike, and again to the high magnification. With a view to showing that the detail can be brought out, Fig. 15, of Bischoff chrome nickel steel, is offered, the data being as follows for this case:

FIG. 14.

Magnifications.....	350 diam.
Etching.....	Medium
Condition.....	Cemented
Metalloids.....	Low
Carbon, Chromium and Nickel.....	Same as Fig. 13
Process.....	Crucible
Structure.....	Clearly defined

This micro-photograph clearly shows the depth of the hard "case," the soft "core," and the *intervening strata*. This is ample evidence of the fact that it is not desirable to go to high magnifi-

FIG. 15.

cations at all. This specimen is also indicative of definite data of the depth to which the hard case can be made to penetrate, if the cementing process is skillfully conducted.

Let us go into this matter at some further length, however, that we may know just what is the nature of the "shell" and the "sap" (core). To do this is to examine the micro-photographs of the same (each of them) in detail. For the "shell," Fig. 16 is here given, the data of which is as follows:

Magnifications.....	350 diam.
Etching.....	Medium
Condition.....	Shell (hard)
Metalloids.....	Low
Carbon, Chromium and Nickel.....	Same as Fig. 13
Process.....	Crucible
Structure.....	Well defined

FIG. 16.

For the "core," as depicted, Fig. 17, the data is as follows:

Magnifications.....	350
Etching.....	Medium
Condition.....	Core (soft)
Metalloids.....	Low
Carbon, Chromium and Nickel.....	Same as Fig. 13
Process.....	Crucible
Structure.....	Well defined

Fig. 18 is given to show the great difference as between magnifications of a small number of diameters, and the results of

FIG. 17.

high magnifications; the Fig. 18 shows a fracture of a specimen of nickel steel at 20 diameters. It is obvious that if the micro-photographs can be distinguished from each other, the difference will be apparent to the observer through a microscope, or even if a magnifying glass is used of a power of 20 diameters.

That a repair man should be able to tell the genera of steel in a part is fairly certain; but should he fail to come that close,

FIG. 18.

he can at least note if the structure is open or close, and the fracture can be inspected to observe if the same is *crystalline* or of a *silky* nature.

A little skill helps out wonderfully, and skill is but the prod-

uct of *oft-repeated attempts*. There are none with a monopoly of brains, though steel mongers are wont to have us think so.

At all events, it must be true that the quality of the material in the part to be *replaced* should be *inferior*, if anything, to the quality of the material of the replacement. This can only happen if the process of arriving at the conclusion is thorough.

Some Further Considerations in Conclusion.

In working up material for use in parts there are diverse ways of fashioning the parts, but it can be said the end will always be the same. In other words, the strength of the material may be adequate, but in the process the methods may be adverse.

Take, for illustration, the matter of crankshafts; if they are slabbed out, the result may be about the same as if a plank of wood were worked in the same way. The grain will lay so as to render the strength dependent upon the relation of the grain to the cuts, and the minimum strength is likely to be the result.

Broken crankshafts frequently show the effect of the manner in which they are made, in that they part in a plane parallel to the axis, through a crank arm, generally the one nearest the flywheel. If the crankshafts are from die (drop) forgings, this danger is not so imminent, because the grain lies in such a way as to afford the maximum strength.

If a crankshaft fails in service it is easy to lay it on to something besides the material or the manner of its fabrication, but as a rule the one or the other will be at fault. To simply duplicate the first error is but slight justice to the owner.

Take the question of changes in the contour of parts, the

changes should be anything but abrupt. Most ungainly looking fillets of considerable radii would be much more to the point.

A great many members fail through the section in the plane of threads; this is due to the fact that the roots of the threads are V-shaped and as a rule too deep. The Sellers thread is considerably better, besides the thread should not go clean up to a shoulder. Undercut for a distance of at least a full thread and end with a fillet.

A hole through a shaft close to a shoulder will help to concentrate the strains and the end may be the shaft will twist off at that point. There are crankshafts in cars that have this fault and they have repeatedly failed on that account.

The pinion of a planetary gear must be made with a small number of teeth and the shaft cannot be of great diameter; the pinion should not go up to a shoulder with no fillet; the shaft will twist off at the shoulder, even if there is a chance of it not doing so, assuming a radius. The material should be extra good for a case of this sort.

Keys will not hold unless they are fitted very tight. Put a boy on some other job, but put a machinist of considerable experience on the key fitting. A loose flywheel is not a pleasant thing to be ship-mates with in a swamp, miles from home.

When rear wheels come off, it is not safe to figure that the thing will happen in front of a hospital. They will come off if the fitting is not carefully done. As some cars are made, true, they may come off if the fitting is well done in certain cases. It is important to be very careful in such cases, and it will reflect no credit on the repair man who fails to do good work.

MOTORS THAT HAVE MANY DISTINGUISHING FEATURES

It does not require more than a single glance to note that the motor shown by the accompanying illustration differs from automobile motors of its kind at present on the market. A closer inspection shows the view to have been taken from the inlet side of the engine, as will be evident from the attachment of the carbureter on that side, but the familiar maze of piping in the shape of manifolds that render access to the valve mechanism and other parts of the motor difficult, is entirely lacking. It will also be noticed that the ignition timer is placed directly alongside the carbureter, thus centering the parts most in need of inspection and adjustment at one point on the motor, and one that is entirely free from obstructions. Another striking feature of this motor is its lack of circulating water piping, as the only evidence of the latter is to be seen in the return pipe to the radiator, which runs along the top of the cylinders.

This great simplification has been accomplished by casting the individual cylinders with integral ports leading from the base up to the inlet valve openings. These ports in the cylinder castings correspond with similar openings cast in the upper half of the crankcase, or engine base. Both the gas manifold and the water-circulating pipes are cast on the inside of this base, thus making an extremely neat and simple motor, this location of the intake manifold also hav-

SIMPLICITY OF THE PIGGINS MOTOR, INTAKE SIDE.

ing the great advantage of warming the mixture. All connections are made at once, merely by fastening the cylinder in place on the base. Five liberal-sized main bearings are provided for the crankshaft, and they are automatically oiled by means of oil tubes and wicks, in addition to the usual standard splash system. The water pump, of the gear type, is located forward on the exhaust side and connects directly through a short pipe to the cast piping inside the crankcase. A petcock placed on the latter permits of entirely draining the entire circulating system at any time. This crankcase is so cast that the camshafts, complete with their gears, may be withdrawn without disturbing any other part. The connecting rods are steel drop-forgings with bronze upper bearings and babbitted big ends. The flywheel end of shaft is provided with a thrust ball bearing. This motor is but one of the many types made by Piggins Brothers, Racine, Wis., who have had a long and interesting experience in motor building, having constructed a steamer as far back as 1883, an electric in 1897, and their first gasoline car in 1902, the latter being a two-cylinder four-cycle 4 by 4-inch engine, capable of making 18 miles an hour with four up. Their present line includes two, four and six-cylinder vertical motors from 4 by 4 1-2 inches up to 6 by 6 inches, and a special line of vertical two-cycle marine motors.

NEW TYPE OF INDUCTOR MAGNETO.

Leon J. Le Pontois, who has made an extended study of the problem of automobile ignition for several years past, has just completed a new magneto of the inductor alternator type, in which the rotor consists of a crescent-shaped iron core carrying no windings. It is an extremely simple and efficient generator and differs in numerous respects from the magnetos now in use.

The field magnets and the windings in which the alternating currents are generated by the rotation of the iron core are stationary, no brushes or current collectors being employed. The magnetic field is composed of a number of steel plates pressed into close contact by the frame and securely held by bolts.

Each of the plates, or laminations, is magnetized by a special process which tends to cause the steel molecules to assume permanently parallel positions in the axis of magnetic polarization in the V-shaped portions of the field magnets. In order to obtain this result, the V-shaped ends of the plates are first brought to the desired temperature and then suddenly cooled and thereby hardened, while their

WIRING LE PONTOIS MAGNETO.

molecules are under the influence of a powerful magnetic field. The central portions of the plates, upon which the coils are wound, as well as the polar projections, are maintained thoroughly annealed during the process of hardening, the plates thus retaining their magnetism much better than when magnetized cold.

The V-shaped portions constitute the permanently magnetized portion of the magnetic structure. By thus providing the integral magnetic structure, which is hardened and permanently magnetized in certain portions, while it has soft portions of high magnetic permeability, it becomes possible to construct an inductor magneto having a good electric efficiency and a comparatively large output for its size. The extensions of one central portion are, therefore, say, of north polarity, while the extensions of the opposite central portion are of the opposite, or south polarity. The polar extensions around which the generating windings are placed are connected, as will be plain from the sectional view.

The rotation of the iron inductor causes the magnetic flux threading through the stationary windings wound on the bridges to pass from a maximum density in one direction to a maximum density in the opposite direction during a comparatively small angle of rotation.

The illustration shows face and rear views respectively of the circuit closer and interrupter, operated by a cam on the rotor shaft and serving to short circuit the combined circuit of the two stationary windings, excepting at or near the time when the current is employed to produce a spark. The means for closing and opening the circuit at the contacts comprise an arm pivoted to a part supported by the outside element of the machine. The shaft of the arm is oscillated by the engagement of a roller with the cam, which roller is carried by an arm, also extending from the shaft. The electric circuit is opened at the moment when the current induced in the stationary windings reaches its maximum.

The breaker is of an extremely simple construction and

can be removed from the magneto frame at any time for inspection should the platinum contacts require cleaning or adjusting. Two pointers respectively located on the breaking arm and its frame permit accurate adjustment of the breaker point, and when the frame is placed back in its casing, in the magneto frame, the timing is perfect. The frame and magnets are mounted in bearings so as to be adjustable therein. By reason of the exterior form of the plates and of the magnetic field composed of them, it is possible to swing the whole structure (field magnet and the breaker) about their pivotal supports without causing the magnets to extend laterally beyond the center diameter, thereby permitting an effective spark range of about 80 degrees without increasing the space occupied by the magneto. It will be noted that the spark has the same intensity in any of the positions in which it is necessary to shift the magnetic structure in order to vary the time of ignition.

It will also be noted that the dimensions of the polar faces of the rotating element in operative magnetic relation with the polar faces of the stationary element are such that the total magnetic reluctance of the combined magnetic circuits changes very little in the different positions of the inductor when rotating within the stationary structure. This is due to the width of the polar faces of the rotor being greater than the distance between adjoining polar extensions of the stationary element. Abnormal magnetic leakage which would otherwise lead to ultimate demagnetization of the permanently magnetized portions is consequently avoided. This arrangement also greatly increases the rapidity with which the intensity and direction of the flux in the generating windings changes, and correspondingly increases the intensity of the current generated. Thus, it will be understood that although the change in the density of the magnetic flux through the alternative paths successively controlled by the rotor tends to correspond with the respective reluctance of said paths, yet by reason of the fact that the windings are short circuited upon themselves while the reluctance of the magnetic path is increasing, the current induced in the coils tends to oppose such change, and the rate at which the density of the flux decreases is not proportional to the increase in reluctance of the magnetic path.

It will be noted that owing to their position in the field structure and their mode of connection, the windings exert a preponderating magnetizing action on the field structure,

LONGITUDINAL AND CROSS-SECTIONAL ELEVATIONS AND BREAKER.

which tends to maintain the permanently magnetized portion of the field thoroughly magnetized. The wiring diagram shows the method of utilizing the breaker of the magneto in connection with batteries should it be desired to provide for double ignition. However, in actual service, it has been found that the electric output of the magneto is so great that the motor can be started by the crank without great exertion. The condenser is located within the magneto itself, but the induction coil is a separate unit. The armature rotates on annular ball bearings. The new Le Pontois magneto is being manufactured and marketed by Hurd & Haggin, 316 Hudson street, New York.

SELF-ALIGNING TAPER ROLLER BEARINGS*

BY H. W. ALDEN, MEMBER OF SOCIETY OF AUTOMOBILE ENGINEERS.

THE object of this paper is to present some facts concerning the design and action of certain forms of roller bearings and to illustrate their practical application to various automobile conditions.

I will touch on just four phases of the question that arise in automobile practice, viz.:

FRONT HUB, E. R. THOMAS MOTOR CO.

- (a) Side load capacity.
- (b) End thrust capacity.
- (c) Means for insuring correct alignment of rolls.
- (d) Provision for taking up wear.

There would seem to be no chance for argument that in the abstract a roll should be capable of carrying a greater load than a

ball of the same external physical dimensions, granting that material and workmanship are identical and eliminating the question of alignment of the roll. Comparisons made in this article will assume a ball bearing using a curved surface for the cone with a radius of .7 the ball diameter. No distinction will be made between the annular or radial, and the so-called bicycle type of ball bearing. In the roller bearing the diameter will be assumed, same as that of the ball with length equal to diameter.

If we consider that, when a ball or roller is loaded, there is an infinitesimal flattening out at the point of contact, then the load-carrying capacity, other things being equal, will be approximately proportional to the area presented to carry the load. We find that assuming the roll or ball and the cone to suffer a deformation of approximately one thousandth of the radius of the ball or roll, we get resulting areas in the ratio of approximately 7 1-2 to 1 for the roll and ball respectively. Now it is this remarkable showing that has tempted so many to experiment with the roller bearing. A search through the patent files of this country alone shows an almost unlimited number of attempts, very few, however, of which have ever come to light, and almost all of which have disappeared from view. Perhaps the majority of experimenters have tried the taper roll, which statement brings us to second point, end thrust.

The cases where a bearing is submitted to side load alone are possibly in the majority, but there are many cases where the bearing has both side and end load to withstand. This is particularly true in the case of the automobile, where perhaps the majority of the bearings have to stand thrusts, some of which, as in the case of wheels and bevel gears, are exceedingly severe. I think

40TH-H. P. REAR AXLE ASSEMBLY.

we sometimes fail to recognize the severity of this front wheel end thrust. When turning a corner of 25 ft. radius at 15 m. p. h., which is by no means rarely done, the end thrust on that front wheel bearing which gets the maximum thrust is just about the same as its legitimate side load. This bearing then ought, by virtue of its design, to be able to take about the same load one way as the other. Now this is a strong point of the taper roller bearing. It can be shown that such a bearing, having an included angle of approximately 23 degrees for the cup, can carry the same end thrust load as side load for a given surface pressure normal to the roll surface. I find that there is a pretty general impression that, in the case of a taper roller bearing, having an abutting shoulder, all of the end thrust load is taken on this small shoulder. This is not the case, as can be shown by a simple illustration. Suppose a complete bearing to be subject to end thrust, but not to be in motion. Now, while the load is still applied, remove the rib or shoulder on the cone, by screwing it back out of the way, for instance, and it will be found that nothing happens. No matter what the load, the rolls refuse to change position. Now rotate the bearing slightly and it will be found that, so long as the rolls remain in correct alignment, there is no

CHANGE GEAR SET MADE BY WARNER GEAR COMPANY.

axial change in their location. When they get out of alignment, however, they begin to creep back up the cone.

This brings us up to the third point in question, that of alignment. And this, be it said, is the feature of greatest importance in all roller-bearings. It is the rock on which many a roller-bearing has gone down. In the case of parallel roller-bearings, there is a peculiar but persistent tendency of the rollers to work endwise; not great, but still present. Now most parallel roller-bearings have some member either on the cone or cup, or both, to limit this action, and sooner or later the roll brings up against this abutment. So also in every taper roller-bearing, the rolls bring up with a certain slight pressure against this same limiting element. It is at this crucial point that roller-bearing designs and construction diverge. From this point all can be divided into two classes, those receiving this limiting effect at one end of the roll and those receiving it at both ends. Perhaps I should not have referred to the latter class in the plural, as there is only one where this effect is obtained, i. e., receiving this limiting action at both ends of the roll. If the roll bears ever so lightly against an abutting shoulder at one end only, the tendency is to exert a slight retarding effect at this point which disturbs the alignment. With the correct alignment

*Paper read before the Society of Automobile Engineers at New York.

TYPE OF GEAR SET THAT IS USED ON THE AUTOCAR.

gone, there is then not pure rolling action, but a rubbing action, and furthermore the area of contact at once is greatly reduced. In other words, sliding friction has been substituted for rolling friction, and the contact area to carry the load has been reduced. The life of the bearing is therefore greatly reduced. When, however, this slight retarding effect is applied equally to each end of the roll, it is changed from a disturbing action to an actual guiding action.

When the Timken Company first began work on taper rolls, they, like all others before them and some since, had but one rib on the cone, and their earlier experiments were all failures, as could have been predicted had the proverbial foresight been as good as "hindsight." Upon the introduction, however, of the two ribs, the alignment difficulty disappeared, and some seven years' experience covering many forms of application prove the fundamental value of these two ribs. Another feature of the taper roller-bearing which appealed at the outset was the ability to take up wear with this form of bearing. We like to think that wear does not occur with pure rolling contact, but the bulk of the experience of users of bearings shows that in most cases wear does occur. If it cannot be taken up, it continues at an increasingly rapid rate, whereas, if it can be taken up, the bearing is ready to start out fresh again. Doubtless for some service, size and material can be chosen to eliminate wear from practical consideration. These cases are limited, however, and even in such cases a larger amount of material must be used than would be required if some wear could be tolerated. On the whole, then, from a practical standpoint, the taper roller-bearing using two ribs has good reason for its existence, because of its area of contact giving large side load capacity; its large inherent and thrust capacity; its insurance of correct roll alignment, and its adjustability for wear.

CHANGE-SPEED GEAR OF THE STODDARD-DAYTON.

USING OXYGEN TO INCREASE MOTOR POWER.*

It seems difficult to realize that the practice of "doping" may be extended from the race course to the automobile track, or *du sport hippique au sport mécanique*, as our Gallic confrères put it, but this is nevertheless the case, "drugged" motors having been used at Brooklands. But the drug in this case is simply oxygen, and the following is an elementary explanation of the phenomenon. It is a matter of common knowledge that the energy created by the four-cycle motor comes from the expansion of gas, raised by rapid combustion to a high temperature and pressure. These two values, temperature and pressure, are connected by a direct relation, the pressure on the piston, which is transformed into mechanical work, being greater as the temperature is higher. This relation permits of calculating the value of "doping" a motor.

Why this temperature should be so high is also easily explained. It is conceded that the explosion is an adiabatic combustion under constant volume. The heat produced by the combustion being employed to raise the temperature of the resulting gases, if we know the specific heat of these gases under constant volume, it will be easy to value the temperature theoretically attained. In the case of oxygen the weight of the gas to be warmed is less than that of air, since the latter is constituted, in weight, of 79 per cent. of an inert

GEAR SET OF THE THOMAS DETROIT "FORTY."

gas, nitrogen, which does not participate in the reaction, but which must, nevertheless, be raised to the high temperature.

For an equal quantity of heat disengaged, the weight of the gas to be warmed, in the case of air, is greater as the temperature to be attained is lower, and it is calculated that the theoretical temperature attained by a gasoline flame in pure oxygen is 7,000 C., while it does not surpass 2,500 degrees C. in air. From this the enormous influence on the thermodynamic output of the motor which may be gained by the use of oxygen is evident. It must be borne in mind that there can be no question of supplying pure oxygen to a motor constructed according to present standards, as the explosive pressure reached would be such as to utterly destroy the cylinder. It is also necessary to radically change the conditions of carburetion, the amount of air necessary for complete combustion of a given weight of gas being diminished as the proportion of oxygen is augmented. It will be seen that this artificial enrichment of the mixture may be of considerable utility in certain cases, such as aviation.

The results already attained by M. Jaubert with an Aster motor, using "oxylithe," an alkaline peroxide producing oxygen in the presence of water, which is an invention of his, show that the injection of three liters of oxygen per horse-pirated, gives an increase in power of 70 per cent.

power-minute, or 4 to 5 per cent. of the total volume as-

LETTERS INTERESTING AND INSTRUCTIVE

A METHOD OF OILING THE MAIN BEARINGS.

Editor THE AUTOMOBILE:

[1,188.]—Will you kindly tell me if you think this system of oiling the main bearings of a motor would be efficient? Enclosed is a rough sketch. The crank dips into the oil in the crankcase and some is forced into the hole at A. The passageway B becomes filled by the repetition of this and gradually the oil is forced out at C and lubricates the bearing. Do you think the centrifugal force would throw the oil out and so prevent it from reaching C? The other parts of the motor are to be oiled by the splash system.

Will you also give me the dimensions of standard auto frames? That is, the width at the front between the side members and the same for the back.

New York.

It is customary with quite a few American makers to drill the crankshaft in order to facilitate lubrication, and centrifugal force is taken advantage of to carry surplus oil fed directly to the main bearings, through holes to the crankpins. In the arrangement you outline there is nothing to prevent centrifugal force throwing the oil out of the hole faster than it can be forced in; in fact, it is doubtful if centrifugal action would permit any oil to reach the bearings through these holes. You are trying to force oil from a point on the

DETAILS OF THE PROPOSED LUBRICATING SYSTEM.

circumference of a circle to its center against the action of centrifugal force, which is constant, so that it will be plain that such an arrangement would not be practical.

Frame dimensions differ so much with different makers that it would be difficult to say whether there is such a thing as a standard for this essential. On touring cars the frame is narrowed forward to about 36 inches, in some cases slightly less and in others not so much. The width back of the motor is anywhere from 40 inches upward, but will probably not be found to exceed 48 to 50 inches in any case, as few cars exceed the standard tread, which is 56 inches. In a few instances the frame is not narrowed forward at all, in which case it will seldom be found to exceed 38 inches in width. This would probably only be found on what are known as light touring cars; also low-powered runabouts.

KEROSENE AS A NON-FREEZING SOLUTION.

Editor THE AUTOMOBILE:

[1,189.]—Would you kindly state in your "Letters Interesting and Instructive" if kerosene is a good non-freezing solution to be used in cooling an engine? Would kerosene in any way affect the steel or working of the engine? If it does not, what per cent. should be used for Chicago weather?

Chicago, Ill.

If you will refer to letter No. 1078, from F. R. Zeigler, and the answer thereto, which appeared in the issue of THE AUTOMOBILE of January 9, 1908; also letter, No. 1129, from Cecil Carr, published in the issue of January 23, 1908, we think you will find the subject pretty well covered. Kerosene would have no bad effect on the metal of the engine and it would have to be used "straight" for Chicago, or any other brand of weather.

RECORD-BREAKERS IN VARIOUS SPEED TESTS.

Editor THE AUTOMOBILE:

[1,190.]—Please let me know through "Letters Interesting and Instructive" the following facts:

(a) The date and time of the Stanley steamer one-mile record.
(b) The date and time of the winners of the Fort George hill climb.

(c) The date and time of the 1,000-mile record.

New Rochelle, N. Y.

CORNELIUS SHIELDS.

The Stanley steamer one-mile record was made on the Ormond-Daytona beach, January 25, 1906, Fred Marriott driving. Time, 0:28 1-5. Frank Leyland, driving a Stearns six-cylinder car, made the best time in the Fort George hill climb, August 3, 1907; time, 28 1-5. Time made by other winners was as follows: Class 100 to 125 square inches, C. P. E. Schilpp, on 60-horsepower Stearns, 32 2-5; class 80 to 100 square inch, P. J. Robinson, on 35-horsepower Stevens-Duryea, 36 1-5; class 60 to 80 square inch, J. P. Grady, 30-horsepower Pope-Hartford, 39 3-5; special for Stearns cars, W. A. Tilt, 44 4-5; electrics, H. E. Wagner, on Babcock, 1:53 4-5. The world's 1,000-mile record was created by S. F. Edge in his 24-hour run on Brooklands track, England, June 28-29, 1907. No time was taken for the thousandth mile, but at the end of the fifteenth hour the distance covered was 1,006 miles 1,640 yards. The American 1,000-mile record belongs to Clemens and Merz, time, 21:58 4-5, on a 30-horsepower National, at Indianapolis, November 17, 1905.

TAKES A NEW MAN TO CRANK IT EVERY TIME.

Editor THE AUTOMOBILE:

[1,191.]—I have a car which is giving me endless trouble. It wears a negro out each time it is cranked, and when once it decides to start the engine apparently runs all right until the low speed is thrown in, when she begins to stop, and when the high speed is thrown in, stops completely. The engine has just been overhauled, has good compression, and turns easily when the spark plugs are removed. The carbureter is located ahead of the cylinder and at about the same level, and uses cold air. Have tried two Kingston and one Schebler carbureters, one-inch size. Would it help materially to hang this carbureter under the engine, or by its side (which would cut off about 1 1-2 feet of pipe and one bend), and take hot air from off the exhaust pipe? Do you think a 1-inch carbureter large enough for this 20-horsepower engine? On account of the carbureter being on a level with the engine cylinder, does this allow too much gasoline to get in and make too rich a mixture? I notice in most engines the carbureter is below the cylinder inlet. Can you make me any suggestions?

Birmingham, Ala.

S. B. SLATER.

Judging from your statement of the case, it would seem that the trouble might be due entirely to deranged timing either of the valves or ignition; that is, the ignition timer has become so placed that while it will run the engine, the spark occurs in such a period in the stroke that there is barely enough power developed to turn the engine over light. The moment that any considerable load is applied, it naturally comes to a stop. This also accounts for the great difficulty you mention in starting, as it is next to impossible for any one cylinder to generate enough power to turn the engine over so that it will take up its cycle. Look to the ignition timer and set it with relation to the piston of the first cylinder, so that the spark occurs—the advance lever on the wheel being about one-third way down the sector—when this piston is at the upper dead center and about to descend on a power stroke. To find this out, the spark plug should be removed and a stiff piece of wire dropped into the first cylinder, either through a spark plug or a petcock opening, so that the position of the piston may be checked. The valve covers should also be taken off, so as to ascertain when the piston is about to go down on a power stroke. This will be when both valves have remained closed on the upstroke immediately preceding. Having ascertained this, see if the

provision for fastening the timer on its shaft coincides with this setting. If any special arrangement has been made for preventing the timer from rotating on its shaft, this should be the case, or at least it should come very near one way or the other, and if so, the timer should be fastened in its original position. Also look to the timer contacts and spring, and to the vibrators of the coils, as unusual delay in the action of either of these parts often accounts for a great loss of power.

The one-inch carbureter is plenty large enough for the engine in question, and as numerous motors run very successfully with a carbureter in the position you mention, the arrangement is hardly to be condemned on that account alone, although, in our opinion, dropping it a foot or so in order to take advantage of the greater length of the manifold will make the mixture more homogeneous and freer from liquid gasoline and might prove a more satisfactory arrangement. Using hot air might also be an improvement.

The valve-timing should also be carefully checked in the same manner; that is, with the aid of the wire mentioned to determine the piston's position and with the valve covers off to note their movements. Beginning with the power stroke for which the ignition has been set, see that the exhaust valve opens at a point about 15 to 20 per cent. of the length of the stroke from the lower end and remains open until the following upstroke has been fully completed, when the inlet valve should rise, remaining open until the piston has passed the lower dead-center and has risen to a point about 10 to 15 per cent. of the length of the stroke from the bottom. If there be no flywheel marking to aid in checking this, the wire will be found valuable, as it may be marked in fractions of the length of the stroke, or the marks may be made on the periphery of the flywheel as you proceed, beginning with the upper dead-center just before a firing stroke and measuring in degrees on the flywheel circle, the exhaust valve being given a lead of 30 to 40 degrees and the inlet 20 to 30 degrees late in closing. Unless something has happened to disturb the position of the cams on their shaft, the setting of the first cylinder will suffice for all, and we feel certain that with the valves and ignition properly timed you will have no further trouble from lack of power.

ECONOMY OF FUEL OR IGNITION CURRENT.

Editor THE AUTOMOBILE:

[1,192.]—A number of "Letters Interesting and Instructive" have dealt with the subject of current consumption of coils from the standpoint of battery economy, but not much is said about fuel economy.

Is it not true that some of your correspondents over-rate the importance of reducing current consumption to the minimum, or, in other words, will a coil do its maximum work when adjusted to consume the minimum amount of current? Is it not more economical to adjust for the hottest possible spark and thus reduce fuel bills, at the expense of battery bills? How much current per unit should a Splitdorf coil consume to do its maximum work?

The makers of mechanical storage battery chargers intended to be mounted on automobile engines very properly tell us of the advantages to be gained by their use. I would like to know what their disadvantages are, or at least the most serious and common ones. Does the vibration, dirt and water to which their position exposes them render them more or less unreliable or troublesome? Are they likely to injure battery by overcharging?

Pontiac, Ill.

SUBSCRIBER.

Extensive experiments have shown that beyond a certain point little or nothing is gained in actual practice by making the electric spark "fatter" or hotter. In every-day practice this is found to be about the minimum that the engine will run regularly on. The average autoist has no facilities for determining current consumption beyond a rather liberal range of error, and as the latter is on the side of excess rather than the reverse, the practice of adjusting coils to take the minimum consumption of current is economy in every sense of the word, and using more current would not be a gain in the fuel supply. The experiments referred

to showed conclusively that beyond the point where sufficient current was employed to properly ignite the charge there was no further gain in power nor saving in fuel consumption by using more current. Too many carbureters are poorly adjusted, and this accounts for a great deal of waste that is only too often put down to poor efficiency on the part of the engine. The latter will run better on a minimum fuel charge and do better work. We cannot say how much current any particular coil will require without putting it to test, but any well made coil will operate under very favorable conditions on as low as .25 ampere. As the conditions vary, this will increase, but on a properly kept system it should not exceed .50 to .75 ampere. Some coils are very poorly designed and cannot be made to operate satisfactorily on less than 1 to 2 amperes.

The difficulty with any direct-current generator on an automobile engine is that of maintaining its speed within a reasonable latitude of the r. p. m. rate at which it gives its normal output. A well built dynamo of this type will operate at as low as 1,500 r. p. m., but to get this speed at a low engine speed it has to be run from the flywheel or geared up several times in some other manner. When the engine reaches this speed the dynamo would be making anywhere from 6,000 to 10,000 r. p. m. and immediately be burned out if it were not for the governor. Sensitive and reliable governors have been adopted, but the system is not looked upon with great favor by many designers. Vibration, dirt and water has no effect on the generator, as it is usually "ironclad," i. e., completely inclosed, nor is the battery liable to be overcharged, as an automatic cutout is generally employed to prevent damage either from this cause or from stopping, which would otherwise allow the battery to discharge itself.

DIFFERENT OPINIONS ON LUBRICATION.

Editor THE AUTOMOBILE:

[1,193.]—My chauffeur holds that there being three divisions in a six-cylinder engine crankcase, and oil supposed to be in these three divisions, that, should one of these be empty, the bearing at that part of the crankcase will run hot. I differ with him, and state that this would practically make no difference at all; that if there was plenty of oil in even one division, this would be beaten up into a mist by the rapidly revolving crankshaft, and this mist would permeate every part of a crankcase.

The chauffeur quoted a case to me of a six-cylinder car here that he knows of, the back bearings of which melted out in the manner described. I assert that if the back bearing was melted out, it was because there was not sufficient oil in any part of the crankcase, which any part of the crankshaft could reach, consequently there was no mist of oil to reach that, or any other part of the bearings, and that if he had driven very much further the other bearings would have melted out also.

The chauffeur also states that the raising of the springs in the back part of the chassis by putting a block under them would so disturb the level of the engine that the oil would be constantly in the front compartments, and not behind. I stated that this was manifestly ridiculous, because every little inequality in the road, which the front wheels surmount, would more than compensate for the difference of an inch or two rise in the chassis behind, and I pointed out to him that in going up or down a steep hill, or over a rough road, any raise of a couple of inches in the back springs counts for little or nothing in the level of the engine. He then asked, Why is the crankcase separated into compartments? And I said that, after all, it is desirable to have the oil evenly distributed, and that it costs practically nothing to make those divisions. Will you please state which is correct?

Toronto, Ont.

CHAUFFEUR.

Your chauffeur is correct in the stand he takes regarding the oil level in the crankcase. A high-speed engine not only runs very fast but gets very hot, and requires something considerably more substantial than a mist or spray of lubricating oil to properly oil its main bearings. Moreover, a six-cylinder engine is very long and it will be quite evident that if there were only oil in the forward compartment this would be of very little benefit to the rearmost bearings, unless the quantity in the forward ones was excessive and one over-

flowed into the other. This rear bearing does the major part of the work and is usually made much larger; consequently, it not only has to have more oil proportionately, but the importance of a constant supply is also greater, as otherwise it will cut or melt out sooner.

The instance that your driver cites is not an uncommon one and would be quite possible with the normal supply of oil in the front compartment, and probably with this quantity in both the front and middle compartments, as the partitions may be quite high. Therefore it does not follow that the crankcase as a whole was dry. Even with a very little oil, the result of the splash is more than a mere mist.

Your driver is also correct in his contention that raising the rear part of the chassis will disturb the engine level and might interfere with the oiling, unless provision was made to counteract it. You forget that every little rise of the road is both up and down, so that one counteracts the other, whereas, an inch or two rise of the rear of the chassis is always in one direction. To put it in common parlance, "it is working all the time." The crankcase divisions are for the purpose of preventing the oil from shifting from one end or the other, due to inequalities of the road or climbing or descending hills.

SOME PLANETARY WHYS AND WHEREFORES.

Editor THE AUTOMOBILE:

[1,194.]—The instructor of an automobile school at which I was a student gave us the following problem to work out by calculation: If in a planetary gear the crankshaft makes three revolutions each time the rear wheels make one at high speed direct drive, how many revolutions will the crankshaft make at low speed each time the rear wheels go round once? The internal gear has 66 teeth, pinions on sprocket 21, driving gear 24 teeth. We gave it up. The instructor told us how to do it, but could not explain at all satisfactorily the why and wherefore, and I can see no reason for his method, which is as follows: Divide the number of teeth of internal gear (66) by the number of teeth on pinion (21), which equals 3 1-7. Then divide number of teeth on driving gear (24) by number of teeth on pinion (21), which gives the quotient 1 1-7. Then multiply the two quotients, 3 1-7 by 1 1-7 = 3 29-49. Multiply this product by 3 to find the number of revolutions the crankshaft makes each time the rear wheels make one. Answer, 10 38-49. Is this correct?

In studying the planetary gear itself, I could see that the driving gear made an extra revolution, but could not and cannot see exactly why and how it does it. You say, in your answer to letter No. 1,138, in your issue of February 6, "It will be evident that the central gear will have to make one more complete turn to drive the planet round its orbit than the direct relation between the driving gear and internal gear." Will you please explain?

How can I find out about the roads and hotels between Boston and Deerfield, Mass.? As one of the party is not very strong, the daily runs could not be long, and the hotels would have to be comfortable.

H. L. JONES.

Roxbury, Mass.

It will be apparent that when two toothed wheels are in contact and one drives the other, the speed of the driven wheel will depend both upon the speed of the driver and upon the relative sizes of the two wheels. For instance, if the driver runs 100 r. p. m. and both are the same size, the driven will also make 100 r. p. m.; if the driven pinion be half the size, it will make 200 r. p. m.; if twice the size of the driver, 50 r. p. m. Hence, dividing the number of teeth in the driven wheel by the number of teeth in the driver will give their relative speeds. In the case of the planetary gear the planet, or pinion, acts as an intermediate driver, so that the first operation mentioned gave the relation between these two and showed that the pinion made 3 1-7 revolutions for every one of the internal gear. The second division showed, as a result, that the pinion made 1 1-7 revolutions for every turn of the driving gear, and the product of the two would give the number of turns the crankshaft made for each revolution of the internal gear. The gear ratio of the car being 3 to 1 on the direct drive, multiplying this product by 3 would give the number of turns of the crankshaft on the low gear. Regarding the second query, it will be evident that if the

driver and the pinion were both the same size, the pinion would make one turn for every revolution of the driver, as already explained; that is, assuming the pinion to be free. But it is not, as it meshes with the teeth of the internal gear as well as with those of the driver, hence its travel is restricted by the former and for every turn of the driver the pinion makes less than a complete turn, amounting to one complete revolution of the driver in the time taken by the planet to traverse its orbit, or the internal gear.

The best route to Deerfield from Boston is via Worcester, 44 miles; Springfield, about 65 miles, and Deerfield, 30 miles, taking each of these stretches as a day's run. Full information in detail on all New England routes is given in the Official Automobile Blue Book of the American Automobile Association. This gives the nature of the roads, exact distances, all turns, hotels, garages and the like.

HOW ABOUT IT, MR. DESIGNER?

Editor THE AUTOMOBILE:

[1,195.]—Is it necessary for a designer to have all the different formulæ by memory, without reference to books or written formulæ while he is at his work? I would like to get all the information I could about this. How many hours a day do designers work—that work for automobile companies? What is the best book or set of books, in your estimation, for designers' work, and the price of same? Do they have on the market tables or scales for finding the decimal equivalents of eighths, sixteenths, thirty-seconds, etc., parts of an inch?

J. L. BENEDICT.

Lehmaster's, Pa.

Just how much an automobile designer remembers, that is, constantly carries in mind, of his mathematics, is a matter that depends very largely upon the personal equation. Some men are able to carry a great deal more in their heads than others, though it is safe to say that in making calculations involving the use of anything but the commoner formulæ, it is customary to use an engineer's pocketbook, which contains a mass of technical information in form for quick reference. The designer also employs other reference works and data, whether his memory be good or bad. It would be a waste of gray matter to attempt to carry "under your hair" a great deal of stuff that is preserved far more accurately and in better form on the printed page. A designer's work depends upon how busy he is at the time; he may put in 20 hours out of 24 when rushed, but ordinarily keeps the usual office hours of 9 to 5. So far as we know, there is no book, or set of books, especially written for the use of the automobile designer. A good general knowledge can be obtained from Homan's "Self-Propelled Vehicles" and Hiscox's "Gas, Oil and Gasoline Engines," which will be mailed at \$2 and \$3.50 respectively. You will find this in any engineer's pocketbook, such as Kent.

REMEDIES THAT GARAGEMEN ADVOCATE.

Editor THE AUTOMOBILE:

[1,196.]—Let me ask a question, to be answered in "Letters Interesting and Instructive." Usually the front wheels of an automobile are slightly nearer together at the bottom than at the top. Suppose that after some use this difference disappears. Is that condition of any serious consequence? And if your garage man advocates having the front axle bent so as to restore that difference, is it advisable to do so, and where can it be properly done?

Cambridge, O.

FRED. L. ROSEMOND.

The mere fact that the wheels were in this condition would not be serious of itself, but the fact that they had gradually assumed that position might be indicative of serious trouble. The object of placing the wheels slightly out of the vertical, inclining outward, is to give them a better grip on the road in order to facilitate the steering, which will become more difficult and less certain as they approach the perpendicular. It would look as if the bearings had worn, or the spindles or steering knuckles on which they turn had become bent. The wheels should be removed and these parts examined and any defect of this nature remedied. Bending the axle to

compensate for such a condition would merely be making a second defect to remedy the first, unless the cause is primarily due to a bent axle, which may also be the case.

WHAT CAUSES THESE EXPLOSIONS?

Editor THE AUTOMOBILE:

[1,197.]—Through "Letters Interesting and Instructive," please explain why natural gas and air will cause an explosion when pumped together under pressure in the same pipe line. There have been two explosions at the same place here within two weeks. An air compressor is used to pump air during the day and help out the gas pump at night. The explosion occurs at the time the gate is opened which turns the gas in about 100 feet 8 inch line which contains air. The gas pressure on the discharge line is about 150 pounds.

Shinglehouse, Pa.

HERBERT MCGREGOR.

Natural gas and air will form an explosive mixture when present in the proper proportions, just the same as gasoline vapor and air, or any other hydrocarbon. It seems evident that permitting the gas under pressure to enter the pipe containing air sometimes creates such a mixture, but that ordinarily this does not occur, which would explain the infrequency of the explosion. It also seems evident that the pressure of 150 pounds to the square inch is sufficient to ignite such a mixture, which would explain its explosion whenever it happens to be present. Some way of permitting the air to escape as the gas was admitted so that the two would not combine under pressure would provide a remedy.

A PROBLEM IN STORAGE BATTERY ETHICS.

Editor THE AUTOMOBILE:

[1,198.]—We would like to ask you about the storage battery we have on our engine. We bought it with the auto and used it about 500 miles. It got weak and we then used dry batteries the rest of the season. We left the storage battery just as it was all winter, and in the spring we had it recharged with chemicals and electricity. But the chemicals all leaked out. Then we took off the bottom and found that all the glass jars were broken, three in all there was. We then took it apart and found that one jar was half full of wax, another one-third full, and the other one-half full. We took all the wax off; tied the plates together with the strip of wood between and left them that way this winter. Now, what we would like to know is if we get new jars next spring and put it together again and recharge it with chemicals and electricity, will it be as good as ever, or would you consider it worthless after going through what it has. Was it not strange that it worked at all with so much wax in each jar? It worked well for 500 miles.

Bemidje, Minn.

THORN BROS.

If none of the active material has fallen out of the plates, and the elements are properly assembled and charged, they may give service again at a reduced efficiency. It would not cost much to try the experiment. Probably the cells operated for 500 miles before the jars broke.

MAGNETO VERSUS THE ACCUMULATOR.

Editor THE AUTOMOBILE:

[1,199.]—What is the advantage, if any, of a magneto over a good storage battery? I have a four-cycle, four-cylinder engine, and if a magneto would be better than a storage battery, I will get one.

Ehrichsville, O.

ALEX. ROBINSON.

The necessity for recharging the accumulator at certain stated intervals, whether it be in service or not, is accounted one of its greatest disadvantages, and the fact that unless watched it may need recharging through exhaustion from service at an inconvenient time is another. However, the storage battery is a very reliable and simple method of providing ignition current on a car, and where given a modicum of regular care will carry out its rôle at a fraction of the expense of a magneto, though, of course, the expense for recharging is a more or less constant item and depreciation is relatively high. The magneto is probably less subject to trouble than any other form of current supply, though despite its simplicity it is not as generally understood as it should be. Its first cost is relatively high, but its upkeep is merely nominal, and it has a very high factor of reliability and efficiency.

TESTING THE IGNITION COILS.

Editor THE AUTOMOBILE:

[1,200.]—I wish to know whether the ordinary volt and ampere-meter, such as is used to test the voltage and amperage of dry cells, can be used to test how much current is being consumed by the coil, or whether it is necessary to get a special coil current indicator. If, as I am informed, the former can be used, what points of contact do you bring into the circuit? The plug hole and the vibrator, I imagine, or is it possibly the vibrator and the metal of the car? Further, what is the maximum the coil should consume for a two-cylinder, 12-horsepower car?

Asheville, N. C.

CHARLES L. MINOR, M.D.

You will find an answer to your question in the last issue of THE AUTOMOBILE, i. e. February 6, letter No. 1,135 on page 179. The current necessary depends on the coils and vibrators, not on the size or power of the engine. A properly designed, well-built coil that is correctly adjusted will work satisfactorily on .50 ampere, or less, as it has been shown that it is possible to operate on as low as .10 ampere, but this calls for very favorable conditions.

FURTHER TESTIMONY AGAINST THE NOZZLE.

Editor THE AUTOMOBILE:

[1,201.]—In letter No. 1,147, Mr. Bates says he agrees with Mr. Fay regarding the needle valve on the carbureter. He tells of making a nozzle with an opening smaller than a No. 60 drill. A hole of this size is going to get stopped up quicker than any needle valve opening I have ever seen. And, who carries with them such a thing as a needle to clean out such openings? On the other hand, it takes a man who is equipped with a shop to put on these nozzles, as very seldom will two engines take the same size nozzle. For this reason the needle valve has been adopted. The nozzle must be a certain height and the float adjusted for that height nozzle. Gasoline should be strained and also a strainer be placed between carbureter and gasoline tank.

I think it is safe to say that the gasoline mixture is lighter when the engine is running fast than when at slow speed, provided the carbureter is set for slow speed and the needle remains in one position. To back this statement, let me ask why it is that Schebler is going to the expense of making a carbureter on which there is a mechanism to open the needle valve as the carbureter throttle is opened? They also have a compensating air valve on this carbureter.

I have not inspected any foreign cars, and I do not remember any high grade cars without a needle carbureter, especially the newer models.

C. S. VIALL.

PERMANENTLY POLISHED AUTO MATERIALS.

Editor THE AUTOMOBILE:

[1,202.]—The letter of M. G. Augspurger, in your issue of January 16, No. 1,108, brings up again a question about which much has been written and very little accomplished. The needs of automobile construction have brought about changes and improvements in materials which ten years ago would have been considered impossible, and it would seem that some of our American metallurgists would be able to suggest some practical substitute for brass, which would not oxidize or tarnish and yet be strong and ductile enough to be used in the manufacture of accessories, levers, etc.

I have heard of a system of heat treatment with zinc and aluminum which is used in England for rendering steel non-oxidizing, and understand that it is not a plating system, but that the surface of the metal is mechanically changed to produce the quality.

If any of your readers have information with reference to this or any other system of giving polished metal these qualities I am sure that a general discussion of the subject would be beneficial to the trade.

Chicago, Ill.

OWEN THOMAS MOTOR CAR COMPANY,
W. Owen Thomas, vice-president.

INFORMATION ABOUT GEORGIA ROADS.

Editor THE AUTOMOBILE:

[1,203.]—Answering "H. L. Y.," of Toledo, O., in letter No. 1,153, wish to say that I live near Waycross, Ga., and have owned a Cadillac runabout for the last two years, and while the majority of South Georgia roads are a little sandy, there are very few that this little car will not take on the "high." There are several cars owned by country people near me, and they have no trouble going anywhere they want to in this and adjoining counties. And these cars are nearly all low-powered runabouts.

Will be glad to have a letter from "H. L. Y.," provided he wishes any further information.

Fairfax, Ga.

H. D. BUNN.

HINTS AND SUGGESTIONS FOR THE AUTOIST

WE do not think the penetrating powers of kerosene are fully appreciated, says *Autocar*. When a nut or bolt sticks and cannot be moved with a key as long as one dare use for the particular nut or bolt, kerosene is the remedy. It should be squirted all round the stubborn thread. From time to time we have been told by automobilists to whom we have suggested this remedy that it has failed. Except in quite unusual cases this failure has been due to lack of patience. It must not be expected the moment the kerosene has been applied to the thread that the trouble will be over. The nut or bolt should be left for several hours for the kerosene to soak in; then it is almost certain to penetrate. When the nut is in such a position that kerosene runs away without soaking into the thread, it is necessary to fix up some little dodge for stopping this. A simple way is to wrap a rag round the nut and thoroughly saturate it with kerosene, or, in extreme cases, to file a little channel on or about the nut or bolt head, so that some of the kerosene is retained and left to soak into the thread. An excellent example of the penetrating and freeing power of kerosene was afforded the other day on a car having cups over the valves taking the form of large gunmetal plugs, and screwing into the valve chambers by a box spanner with a two-foot lever. It would have been possible to get a longer lever, but it was not considered safe to apply any greater force. We contented ourselves by giving the plug a copious dose of kerosene and leaving it till the next day. After twelve hours soaking the plug came out quite easily.

A Hint on Fitting Piston Rings.

When new piston rings are being prepared it is a common practice, when they are almost ready, to test their size in the base of the cylinder, writes a correspondent to *Omnia*. It should be noted, however, that the cylinder has had less wear at this point than at any other position, and if it is desired to obtain a perfect fit care should be taken to first of all reduce the unworn part of the cylinder to the exact diameter of the upper portion worn by friction of the piston rings. The reduction may be made by the use of a cylindrical block of wood covered with fine emery cloth. When by this means a uniform diameter has been obtained along the entire length

UNEVEN WEAR OF CYLINDER.

of the cylinder, a ring fitted at the base will be gas-tight in every other position.

What to Do When the Motor Seizes.

A seized motor, generally looked upon as a serious accident, need not necessarily be a very terrible affair. If it should happen that through neglect or any other cause the motor is allowed to run without lubrication, heats up and stops, so that piston and cylinders form as it were one block, the best method is to open compression cocks, or if there are none take out spark plugs, or dismount the inlet valves, then pour in a liberal quantity of kerosene. The automobilist may exclaim that kerosene is difficult to find on a car; but it should not be so. It is so useful in a hundred different ways that a couple of pints should always be carried. After the kerosene has been poured in, rest a while to allow it to penetrate, then try to turn the motor over. If after a liberal soaking with kerosene it is still impossible to turn the engine, the car should be put into low gear, the clutch left in and the vehicle vigorously pushed by as many willing hands as are available. Generally such treatment will have the desired effect, the kerosene will

work its way round the cylinder walls and allow the motor to be turned over as readily as usual.

If all this should prove unavailing it can safely be concluded that there is something seriously the matter with the motor, and humiliating though it may be, the best plan is to slip into neutral, get a horse, and proceed in this undignified manner to the nearest auto repair shop.

After the kerosene has done its work of releasing the locked pistons, it should be remembered to empty the crankcase by the cock provided for that purpose in the base. Then add the necessary quantity of lubricating oil and proceed.

BINDER TO PREVENT RATTLING.

To Prevent the Bonnet Rattling.

A bonnet which has a tendency to rattle under the vibration of the motor can be readily silenced by piercing a series of holes in the band of metal on which the bonnet rests and threading through a strip of leather, as shown in illustration. The hood thus resting on leather and not against metal cannot possibly produce a noise. The improvement is so simple any automobilist can effect it.

External Causes Sometimes the Reason.

It may seem an anomalous statement to make, but from the incident given below it will be evident that causes within the motor itself are not always responsible for a failure to start or continue running. On the occasion in question, the motor invariably responded to cranking every time it was turned over on the compression stroke, sometimes taking up its cycle to the extent of making two, three, or even half a dozen complete revolutions, which should have been sufficient to show that it was in working order, but the true cause was never surmised. It is well known that the greatest drawback of the internal combustion motor of any type is its disability to start under load, and the reluctance of this particular motor to do its duty arose solely from the fact that it was unable to get up sufficient headway to overcome the resistance applied to it. The latter was finally located in a dragging band of the planetary change-speed gear and merely easing this off a bit righted matters at once.

This might seem to confine such cases to cars equipped with this type of change-speed gear, but a little reflection will suffice to show that this need not necessarily be the case. It is only the momentum of the flywheel that bridges the gap between the power strokes in the engine, but until it assumes a certain speed not enough power is stored in it to move the working parts sufficiently to bring about the next impulse. Naturally only a very light load is required to discourage the motor to this extent in its initial stages of starting, and it matters little how the load is applied. Under the head of external causes might also be included some deflections as arise from the introduction of foreign bodies, usually in the gasoline, which cause a stoppage of the fuel supply, though this was not the intention in making this subdivision, as trouble of this nature really belongs to a description of carbureter ailments.

"CHOP IT IN TWO OR CUT YOUR WAY AROUND."

THREE-CYLINDER FERRYBOAT AT DEPOSIT, ALA.

HOW THE OLDSMOBILE "MUDLARK" FOUND THE WAY

By ONE OF THE TOURISTS.

ONE month ago the idea of autoing from Greater New York to the Gulf of Mexico was regarded as almost or quite impossible at any season of the year. As a winter cross-country run there appeared to the experts little likelihood of a successful finish to the project. In exactly three weeks after the start was made, however, Ralph R. Owen, of Cleveland, drove his famous 40-horsepower Oldsmobile *Mudlark* from Broadway, New York, to Canal street, New Orleans. The dream for a decade of enthusiastic autoists had come true. The feat had been accomplished in the face of weather and road conditions which seemed to willfully combine forces for the purpose of preventing a happy consummation of Mr. Owen's ambition.

When the *Mudlark* left Columbus Circle, New York City, early in the afternoon of Sunday, January 26, the streets of the metropolis were hidden beneath two feet of snow, and the route carried the tourists over the thick white carpet to Cleveland, nearly seven hundred miles away. Four days were consumed in negotiating this distance, and blizzards did their part in obstructing the progress of the hardy travelers. Six passengers in all braved the weather from New York to Albany, the first day's run, but at that point two returned to the allurements of Broadway.

A blizzard of snow, rain, sleet and a sixty-mile gale played an obligato to the purr of the motor throughout the second day, but at evening the tourists thawed out beside the radiators at Syracuse.

Tradition and railroad guide-books agree that beautiful scenery prevails along the Mohawk Valley, but the travelers saw none of it owing to the thick drop curtain of snowy whiteness which obstructed the view at a distance of ten feet in all directions.

On the third day, Tuesday, the car travel led to Buffalo in an encore of the previous day's storm, over roads which at that time were regarded as very bad, but which, in the light of later experiences, are recalled as boulevards.

Progress Through Ohio with the Thermometer at Zero.

Hurdling the hills to Ashtabula, O., was the next day's undertaking. Extreme cold and heavy fall of snow made the day's work a difficult one, but 150 miles were made between 11 o'clock in the morning and 8 at night. On Thursday a short and easy run was made to Cleveland, the home of two of the party, and most of the day was devoted to entertainment, rest and good wishes of friends. Snow lessened in depth rapidly as the car headed southward, and the first mud of the tour was encountered. Several miles of soft going

were covered at a slow pace. The tourists hoped and believed in their innocence that nothing worse would be discovered in the south country, but were destined to take a post-graduate course in soil study later on.

The route wound its way through Bucyrus, Marion and Delaware, and aside from bitter cold weather the touring conditions were most favorable. Before reaching Columbus, however, a heavy cold rain began to fall, and as night had come on the party was glad to camp beside the steam heat at the Chittenden Hotel. Saturday morning brought another passenger, who was invited to go as far as he pleased. His evident intention was to travel about ten miles in the *Mudlark*, for he had absolutely no extra clothing, but it was eight days later and the car was ready to leave Huntsville, Ala., before he said "Good-bye" and turned back to the north. Rain prevailed during the day's run from Columbus to Cincinnati. The mercury hovered around the zero mark for the first time in years at Porkopolis while the tourists huddled close to the heating apparatus. Cold weather, in fact, was the chief discomfort of the northern portion of the tour, but later on the "troopers" gladly would have swapped the miserable roads of the South for the lowest temperature of the North.

Our Entry Into the Sunny South at Covington, Ky.

Early Sunday morning, with the thermometer registering but one degree above zero, the party hustled across the bridge of the Ohio river into the alleged "Sunny South." It was too cold to jest, however, and the roads were found to be good for several miles. Lexington, Kentucky, served lunch. Two hours were lost but not wasted in visiting the Haggin stock farm, where the *Mudlark* was photographed in a group with Salvator, the famous old race horse, now twenty-one years of age. Two epochs of speed, the race horse and the automobile. Tire trouble, which had been spasmodic all the way from New York, now developed alarming symptoms, but the genuine epidemic did not break out until a day or two later. Then it raged in a high fever until New Orleans was reached, where with one gigantic explosion the trouble was over, for little remained but bare wheels. Fingering the cold tools and rebellious rubber while the mercury is below par is not conducive of buoyant disposition, but everybody forgave the rubber goods makers when the lights of Louisville loomed to leeward at supper time.

The *Mudlark* had now traveled 1,230 miles in a week of comparatively easy going, and with but 800 miles to cover the travelers gulled themselves into the belief that another week would register them at New Orleans. Poor, deluded

strangers in a stranger land! Tooling out of Louisville on Monday the car passed between a long funeral and a wagon loaded with caskets. Everybody denied the slightest trace of superstition, nevertheless four days were consumed in reaching Nashville, just a decent day's run southward. Part of the delay was due to the hospitality of the citizens of Bardstown, Ky., who persisted in showing us "The Old Kentucky Home," the birthplace of Abraham Lincoln, historic churches, and all the glories of the famous old township, including a liberal number of distilleries. During the second day from Louisville the highways were heavy and mountainous and progress slow. C. W. Thatcher's mule-team party of "good roads" promoters was overtaken, and a good roads club of 200 members was organized at Buffalo, Ky.

Bowling Green was reached at night, after many pictures of Mammoth Cave and other interesting places had been taken. A miracle marked the arrival at Bowling Green—a heavy snowstorm was astonishing the natives of southern Kentucky and all business was suspended in honor of the double event. Snow changed to rain in the night, the rivers burst their banks, and the car was stalled between streams for thirty hours at Portland, Tenn. A rescue party from Nashville attempted to meet us with a much-needed supply of tires, but likewise was stalled, and there was nothing to do but wait for the ebbing of the tide. At Nashville on the following day the tourists received further evidence of Southern hospitality, and were royally entertained at the Wautaugo Club. In this connection, it should be stated that a warm welcome was accorded the party at many Northern cities, notably Cincinnati, Columbus, Cleveland and Louisville. The kindest courtesy would have been a warm, clean bed, but the friends along the route enjoyed doing much more than was desired or expected. At Nashville, too, dire hints of bad roads were proffered, but caused little alarm. Was not the engine pulsing perfectly? Were not new tires plentiful, and the price at hand? Still, four days were relegated to the past tense before the beautiful streets of Birmingham were traversed.

A Striking Example of Southern Hospitality.

Huntsville, Ala., was the sleeping place on the first night, but it did not appear on the horizon until the moon rose at midnight. Meanwhile the tourists had forded streams which extinguished the lights and stopped the engine. Scouts waded the rivers with lanterns to find the road on the other side, while animals objected noisily to the intrusion of the woods. The pathway was a tomb with walls of thick pine timber in its natural state. Just beyond this point the travelers received the most memorable example of Southern hospitality of the entire voyage. Nine o'clock in the evening, with nothing to eat since early breakfast! A cup of coffee would offset the chill from the malaria-breeding marshes. A hut

was in sight. Answering the knock came a woman who apparently had been unable to meet the atmospheric condition and beat them backward. Seven small children, gaunt and hungry-appearing, huddled around the inevitable Southern fireplace. Yes, certainly, she would make a pot of coffee. While the hostess prepared the hot drink an inventory of the two rooms was taken by the travelers, merely because everything was in plain view. Six dollars would have been an extravagant price for all the household effects in sight, including two broken banjos. Without a banjo no Alabama home is completely furnished. There may be no bed, but there must be a banjo. The coffee was accompanied by corncake. No sugar, milk or butter in evidence. Everything she had to offer was before the hungry ones. It was all the woman had to proffer, yet, in the face of abject poverty, the first sign of recompense was an insult to her. "No charge, sah," she said, and no price could be arranged. But the kids got \$5.

Everywhere There Was Mud and Rain in Alabama.

The second Sunday found the *Mudlark* in the mountains and valleys of Alabama with a dreary, cold rain prevailing. Mud, like cement, prevented fast travel, and the one redeeming feature was the absence of horses on the alleged highways. In the South horses are not on neiging terms with the automobile, and fastest time can be made at night or early in the morning. During the day the passage is punctuated with continuous stops to lead horses past the car. Night found the travelers at a mountaineer's home, with supper of hog, hominy and hoe-cake. An attic room with rain beating merrily on the roof was not a bad place for sleep. On the following day enormous trees were discovered directly across the only road down the mountain and a private path was carved through the thicket, without asking permission of the owner, who might have been a thousand miles away. Twenty-five miles from Birmingham a swollen creek swallowed the car and passengers. Block and tackle pulled the car out of the bath. The motor refused to balk, and twenty-one miles of the best road in the country were quickly dispatched. We were in Birmingham, the most wonderful city in America for its population. At this city all brands of advice could be obtained free, but as a choice of evils the party determined to try the road direct to Meridian, Miss. Then came the deluge. Mud, deep water, and more mud. The valley is a chamber of horrors. Twenty-five miles of good roads as a teaser, then a plunge into red mud so sticky that it cannot be thrown from a shovel. At one point the car was pulled down hill on a 25 per cent. grade, using block and tackle. Somebody had told us that Meridian could be reached in a single day. The *Mudlark* raced (?) into Tuscaloosa, Ala., that night, less than a third of the distance to Meridian.

On the following morning a start was made very early, but

FAIR TYPE OF MISSISSIPPI ROADS NEAR HATTIESBURG.

NEAR TUSCALOOSA, ALA.—WHICH ROUTE FOR LEAST MUD?

after eighteen hours of continuous travel the car stopped at Eutaw, thirty-five miles away. This may be a reverse English record for American touring. During this day the block and tackle were used twenty-two times and negro guides showed the way along forest paths through plantations. From Eutaw to Meridian, Miss., the only change in road conditions is in the color of the mud. The color scheme changes from red to black, but the clinging qualities of one is equal to the other. At Meridian rains fell in a group, trains were stalled in all directions, telegraph wires were down, and prospects were poor for immediate progress. Within a few hours, however, the sandy soil of that section absorbed the water, and, after reconnoitering for several miles in many directions, it was decided to head for New Orleans by the most direct route and take chances. The Crescent City is but a decent day's journey, according to motorists' measurements, but under the conditions we occupied two full days and nights.

New Orleans Accorded the Tourists Generous Welcome.

The welcome accorded the tourists at New Orleans was worth all the weariness of travel, however, and everybody in the city seemed to have been watching the progress of the car

"MUDLARK" NO. 3 ARRIVES AT NEW ORLEANS.

from New York. The car and its intrepid driver, Ralph R. Owen, were cheered by crowds which blocked the streets, and only the police seemed unfriendly. "Move on" was the constant order, but the tourists had been doing that for exactly three weeks and it was easy to satisfy all concerned. A tour of the entire city was made, the *Mudlark* leading a parade of Oldsmobiles through parks, boulevards and alleys, which in New Orleans pass for streets. Monday, February 17, the tourists were royally entertained at clubs and hotels and in the evening immediately returned to the North. That the car reached New Orleans from New York with the motor putting softly and steadily as when it left the metropolis, speaks well for the development of the American automobile. The trip which was presumed to be impossible has been accomplished, and in the belief of the travelers, particularly Mr. Owen, who has made many American tours, would be a splendid route for the Glidden tour. Not impossible, but likely to eliminate nearly all perfect scores.

THREE RACES ON TARGA FLORIO COURSE.

PARIS, Feb. 17.—Three distinct races will be held in connection with the Targa Florio, May 7 to 10. Powerful touring machines will be provided for in 5.1 bore class; medium powered cars must not exceed 4.1 inches bore, where four cylinders are employed; voiturettes will be limited to 3.9 inches bore for a single cylinder. In addition to the Targa and the King of Italy's cup, \$3,000 in gold will be given to the winner. The first prize in the voiturette race is \$800.

A SCHOOLBOY'S ESSAY ON THE AUTOMOBILE

Topeka, Kan., has a ten-year-old hopeful whose sternly refuses to help him with his lessons or debates. name is Wendell Switzer, and he attends the Harrison School in that City. That the youngster is not sadly in need coaching is evident from the argument he put up the other day in the school debate upon the momentous question, "Resolved, 'That automobiles are more useful to man than horses.'" His support of the affirmative side of the question is so original and unique that the same is worth publication in full. It is as follows:

First, I will mention that automobiles will run longer than horses. An automobile does not give you nearly as much trouble as horses. Very early in the morning you have to get up, dress, and go out in the cold and feed your horses, which is not at all nice, and then you have to wait a long time till they are through eating, which delays you; while an automobile you just have to fill with gasoline the minute you want to start. The feed for the automobile, which is gasoline, does not cost as much as feed for the horses, for the only feed there is for automobiles is gasoline, and the horse has to have corn, wheat, oats, hay, bran and other things, which raise higher and lower, but gasoline never changes its price much at all. And wheat is so valuable, and so is timothy hay, and you hardly ever get good wheat and corn. You have to take such good care of your corn or the crows will get it. And another thing is, that a horse can have only one horsepower, while an automobile can have forty or fifty.

If you do not give your horses good food, you cannot sell them for a good price, for they get weak and sick. Automobiles never get sick, which saves trouble. When a horse gets sick it is more liable to die than any other thing. You can get automobiles of all sizes, while horses are nearly all one size. You have to curry your horses, brush and wash them, which takes trouble. One of the hardest things of all about horses is training. That is very hard. Automobiles don't have to be trained, which saves trouble. To train a horse you must nearly risk your life, for you do not know what or when the colt is going to do. It is a very hard job. When a colt is first bridled up it does not know what to do. It jumps and rears, kicks, runs, and if you hitch one up to a new buggy, there will be nothing left of it, for the colt will do everything it can to get the harness off. The young colt is not used to having harness on, and it feels very miserable to him and he wants to get it off. The horses scare at street cars and rear up and sometimes break the buggy. Automobiles never get scared like horses. You have to hollow at the horse to make it go, while you just have to turn a crank to make an automobile go. An automobile tells us how far it has gone, or going, and how much gasoline it is using. A horse does not do that. It does not tell us how much flesh he is wearing off or how much breath it is using and don't tell us how far he is going, so we don't know when to stop and keep on going and wearing off flesh till the poor horse is nothing but skin and bones, which we call a skater, and make fun of the owner. Some people do not feed their horses, and drive them so much that they drive them to death. You can't run an automobile to death no matter how much you run them, which is better.

PRESENT SAVANNAH TROPHIES

Savannah in 1733. In unusual contrast is the scene on the other side of the central engraving. Here are shown automobiles of latest design at racing speed, with the date "1908." The convoluted stem of the cup has alanthus leaves in relief. The base is Corinthian. The ebony pedestal is octagonal in shape. Cotton bales surround it, affording room for the inscription of the names of the successive winners of the cup. The trophy is to cost \$1,800. Each of the cups awarded by Mr. Van Keuren is to cost \$1,000.

of the winning drivers will be presented in accordance to the common carrier, and,

Whereas, the automobile is the practical forerunner of advancing civilization;

Now we, the Quaker City Motor Club, do hereby propose to enlist and enroll from among our members in good standing a sufficient number of capable and able-bodied men who shall agree to act as a volunteer motor corps.

This volunteer motor corps is to offer its services and machines, through the Quaker City Motor Club, free to the city of Philadelphia, the State of Pennsylvania and the United States government as an auxiliary force, in all cases of urgent need or dire necessity for the suppression of lawlessness and insurrection, or in the grave duty of repulsing foreign invasion in time of war. And,

Whereas, the Quaker City Motor Club is only actuated by true patriotism and love of country, we most humbly pray your best consideration and prompt acceptance of this sincere proposal.

Ratified and adopted February 20, 1908.

The offer of the motor corps' services, it will be noticed, was extended to include not only the city, but the State and the United States as well, as identical letters making the offer have been sent to the President, the Governor and the Mayor.

Among the other business of importance transacted at the meeting was the decision to change the club's quarters from the Majestic to the Walton. Three large second-floor rooms have been secured on the Locust street front of the hotel, and on special occasions additional adjoining rooms will be placed at the disposal of the club. The first meeting in the new quarters will be held Thursday, March 5, when a "house opening" will be in order.

KANSAS CITY CLUB BOOMING GOOD ROADS.

KANSAS CITY, Mo., Feb. 24.—So pronounced was the success of the Good Roads banquet, held January 15, that the members of the club are enthusiastic over continuing the work, and will hold a smoker at the Savoy Hotel, March 12.

OMNIBUSES FOR THE QUARTERMASTER'S DEPARTMENT, U. S. A., TO BE USED AT THE WEST POINT MILITARY ACADEMY.

The three cars represents one day's shipment from the factory of the makers, the Auto-Car Equipment Company, of Buffalo, N. Y. The cars are fitted up in an especially attractive manner, the upholstering being of hand-buffed leather, the windows, plate glass in mahogany frames, electric lights and lamps, electric signals, etc. Motor equipment is two Westinghouse vehicle motors, with 42-cell National Storage batteries, and the tires D Diamond wire mesh base applied with side flanges of 36-inch diameter. In the daily operation they have to overcome a grade of 12 per cent. in a thousand feet.

after eighteen hours of continuous travel the car stopped at Eutaw, thirty-five miles away. This may be a reverse English record for American touring. During this day the block and tackle were used twenty-two times and negro guides showed the way along forest paths through plantations. From Eutaw to Meridian, Miss., the only change in road conditions is in the color of the mud. The color scheme changes from red to black, but the clinging qualities of one is equal to the other. At Meridian rains fell in a group, trains were stalled in all directions, telegraph wires were down, and prospects were poor for immediate progress. Within a few hours however, the sandy soil of that section absorbed the water. After reconnoitering for several miles in many directions

A NATIONAL BODY OF STATE ASSOCIATIONS.

Only through the combined efforts of local automobilists can acceptable local conditions be secured; only through the united endeavors of the automobilists of a State can reasonable State laws be assured; and only through the welding together into a national body of these State associations can the general good of automobiling be furthered and the day brought nearer when anything savoring of unjustness and oppression shall be improbable and impossible.

With a Federal Registration bill pending at Washington, and unusual and varied activities rampant in various States, the need of organization is apparent to all automobilists. No one club can be made powerful enough to encompass the needs of the diversified situation, and this opinion was that of the clubs which assembled at Chicago, March 4, 1902, and formed the American Automobile Association. The years that have passed since then have only confirmed this judgment in a country where centralized direction arouses determined disputation. Any attempt to establish a club autocracy would meet with a unanimous opposition and would do no good to that club which sought to assume the dictatorship of automobiling in this country.

A club is entitled to the right of way in its district as long as it conserves the rights of those whom it assumes to protect, and only when it is derelict in its duty has the parent body any reason to invade club precincts. But the automobilists of a city have a right to expect that the local club shall do all that it can to preserve the un-

led and uninterrupted use of the motor-driven car. No injustice should be borne without protest. This country is one of magnificent distances, but when the era of road-building has fairly gotten into its stride—it is starting in a most convincing matter—the automobile will shorten mileage as easily as is the case in other Europe with its countries wherein highways deserve the name. Coincident with the making of the roads will be the enlarged capacity of supplying touring information, and certainly this cannot be better accomplished than by the accumulating and disseminating work of a national body of State associations comprising local clubs and individual members in districts where clubs do not exist. Even now a member of the A. A. A. can, without extra expense, obtain special information upon application to the association's Touring Board, and the mass of material which has been and is being prepared by clubs and members scattered throughout the country insures the perfection of a bureau which will increase in value and make it superior to any other source of similar information available to all autoists and at moderate cost.

The good of automobiling requires a national organization which shall be such in reality and not alone in name. Judging from the astounding progress of the Hotchkiss-Hower-Thompson-Terry-Hooper-Van Sicklen-Elliott administration, the work of the A. A. A. is only in its beginning, for even the friends and well-wishers of the organization are forced to admit that it has been somewhat erratic in getting into its high speed. Mistakes it has made, and mistakes it will make in the future, but its accomplishments will be exactly what are made possible by the support of the growing army of automobilists. It is a habit of American citizenship as a whole to let the other fellow do the work, unless the discomforts of the situation visit themselves directly upon us, and it must be said that many automobilists withhold financial as well as moral support to those working for their interests. But with over 20,000 already enrolled, and the list growing every week, the A. A. A. should have 50,000 members before the year concludes.

THE PRACTICE OF "DOPING" A MOTOR.

It is a matter of common knowledge that one of the practices of horse racing has been extended to automobile racing, and this is the employment of various substances to make a motor produce far more than its rated power by means which may be compared to what is known as "doping" a horse. Crude methods of doing this involved nothing more than the mixture of some powerful agent, such as picric acid, directly with the gasoline, but more recently science has been called into play and accurately measured doses of oxygen administered.

As a matter of scientific interest, such experiments are of considerable value, as they tend to demonstrate that the internal-combustion motor is far from having reached the end of its great possibilities. On the other hand, they seem to have had an unfortunate influence on many an amateur autoist, who is anxious to try the effects of picric acid, oxygen and acetylene gas for himself. No one who uses horses for his own pleasure would think of following race track practices to get a little more speed out of them, so that it seems strange that so many autoists should wish to learn how to do this to their motors.

GEORGIA'S GOVERNOR TO PRESENT SAVANNAH TROPHIES

SAVANNAH, GA., Feb. 24.—The general executive committee of the March 18 and 19 races have arranged the program of the meet. A feature will be the presentation of the trophies by Governor Hoke Smith, who showed his interest in the races by the offer to call out the military to police the course, which offer was as promptly accepted.

The program decided includes for Tuesday, March 17, at 4 P. M., a parade of the officials in touring cars and the contesting automobiles. Wednesday, March 18, there will be the two 180-mile races. The runabout event will begin at 11 A. M. At 3 o'clock, what has been known as the "six-cylinder cup race," but to which are now to be admitted cars having a piston displacement of more than 575 cubic inches, will be started. Thursday, March 19, will be the big race for the Savannah trophy, start being at 12 o'clock.

At 8 o'clock in the evening Governor Smith will present the trophies at the De Soto Hotel. The challenge trophy will be a silver cup set upon an ebony base, the whole being 27 inches tall. The design is the workmanship of S. E. Theus. The other two prizes are the work of R. Van Keuren. These cups, while smaller than the challenge trophy, have attracted high praise. The challenge trophy is a Grecian shaped two-handled cup. An oval frame containing the picture of Oglethorpe is the central engraving. Beneath the picture is a shield with "Governor Oglethorpe" and a date upon it. Supporting the frame are palm branches and live oak covered with Spanish moss, all in bold relief. On one side of the frame is an Indian scene representing life about

Savannah in 1733. In unusual contrast is the scene on the other side of the central engraving. Here are shown automobiles of latest design at racing speed, with the date "1908." The convoluted stem of the cup has alanthus leaves in relief. The base is Corinthian. The ebony pedestal is octagonal in shape. Cotton bales surround it, affording room for the inscription of the names of the successive winners of the cup. The trophy is to cost \$1,800. Each of the cups designed by Mr. Van Keuren is to cost \$1,000.

Each of the winning drivers will be presented with a bronze medal. These will have a facsimile of the coat of arms of Savannah and a suitable inscription.

N. H. Van Sicklen, chairman of the Technical Board of the A. A. A., is expected to arrive in Savannah within the next few days to assist the local committee.

Mayor Tiedeman and the City Council have gone further than promised and declared both days holidays.

J. H. Andrews, Mineola, N. Y., of the firm which oiled the Vanderbilt Cup course on Long Island, has just left the city after inspecting the roads composing the course. He made a proposition to the committee having charge of the preparation of the roads which will probably be accepted. After looking over the course, Mr. Andrews said of it: "The course is much better than the Vanderbilt Cup course on Long Island. More than every mile of this course is better than any mile of the Vanderbilt course. They are raving about the scenery of this course up North, but the road is better than the scenery."

SAVANNAH AND ST. LOUIS WANT VANDERBILT CUP RACE

AT the meeting of the A. A. A. Racing Board, held Monday last at the association's headquarters, 437 Fifth avenue, New York City, it developed that both Savannah, Ga., and St. Louis, Mo., are substantial seekers for the honor of supplying a course for the 1908 Vanderbilt Cup race in case it is found advisable to hold the event elsewhere than as usual on Long Island. Chairman Jefferson deMont Thompson, who presided at the session, was empowered to investigate the proposition from Georgia and Missouri.

Present at the session besides Chairman Thompson were William K. Vanderbilt, Jr., donor of the famous cup; A. R. Pardington, general manager of the Long Island Motor Parkway; S. A. Miles, general manager of the National Association of Automobile Manufacturers; Alfred Reeves, general manager of the American Motor Car Manufacturers' Association; A. L. Riker, Bridgeport; E. R. Thomas, Buffalo; H. R. Worthington, A. G. Batchelder and Secretary F. H. Elliott.

Various subjects discussed were referred to sub-committees

for disposition. The report of the rules committee, consisting of Chairman Thompson and Messrs. Miles, Riker and Reeves, occupied several hours, and it was decided to send the final draft to the board members for immediate consideration and concluding suggestions.

While nothing definite has been announced regarding the amateur definition, the rule has been thus modified:

A man who has never driven or raced a motor car for pay, either in cash or any other valuable consideration; or competed for a cash prize; who does not make his livelihood or any part of it, as a result of racing or driving, either as a demonstrator, tester, or chauffeur; who has not otherwise received financial reward for engaging in competition; who has never been declared a professional by any sport-governing body, or who, having been so declared, has been reinstated either by such body or by the A. A. A. Racing Board.

Of course, it is still possible to hold special events limited only to those specifically desired in them, but for the purpose of open competition the new rule should be found much more satisfactory than the former one.

A. A. A. TO FIGHT NEW YORK TIRE CHAIN ORDINANCE

AFTER having thoroughly investigated the status of the ordinance recently adopted by the New York Park Board, prohibiting the use of tire chains on cars entering any of the city parks, the American Automobile Association has decided to make a test case with a view to having the ordinance declared unconstitutional, and to that effect has just issued an announcement offering to defend any of its members who may be arrested for a violation of the said ordinance. The announcement will be interesting to autoists of other cities, where similar ordinances may be attempted.

To Members of the American Automobile Association:

Any member of the American Automobile Association arrested for alleged violation of the recently re-enacted ordinance by the Park Board of the City of New York, prohibiting automobiles wearing tire chains, upon due notification to the office of the Association, 437 Fifth avenue, or to Charles Thaddeus Terry, Counsel for the American Automobile Association, 100 Broadway, New York, by person so arrested, the Association will be willing to defend the person or persons so arrested, without expense to him or them, in such a number of cases as may be adequate to test the validity and frugality of such ordinance.

F. H. ELLIOTT, Secretary.

AGENCY SUIT DECIDED AGAINST A. L. A. M.

In the action brought by the Association of Licensed Automobile Manufacturers to punish Walter C. Allen for contempt for having disobeyed an injunction obtained against him some time ago, Judge Holt, sitting in the U. S. Circuit Court for the Southern District of New York, has just decided in favor of the defendant. Mr. Allen was associated with the Dietrich Import Company, and is now one of the builders of the Allen-Kingston car. When he gave up his Dietrich "Licensed" connection and undertook the sale of the Allen-Kingston car, it was a violation of his agency agreement, according to the Licensed Association, which promptly obtained an injunction against him. Mr. Allen did not defend the application for an injunction, nor did he pay any attention to it when obtained, for which reason the association made a motion to have him punished for contempt of court. Judge Holt reviewed the situation at length, and his decision, though on an entirely collateral issue, is considered of importance in Selden matters. He said in part:

If, therefore, the Allen-Kingston automobile is obviously, upon mere inspection, an infringement of the Selden patent, the motion to punish him for contempt in offering to sell it should be granted. The question whether it is obviously an infringement seems to me to depend upon the question whether the Selden patent is a pioneer patent or not.

If the Selden patent conveyed to the patentee a monopoly, in this country, of the right to make and sell any gasoline automobile of the usual types, then I think that the points of distinction alleged in the affidavit of Mr. Smith are immaterial, but if the Selden patent is not a pioneer patent covering the entire fundamental principle of the gasoline automobile, but simply is a patent for a particular kind of a gasoline automobile, I think it at least doubtful, in view of the grounds of distinction pointed out by Mr. Smith, whether the Allen-Kingston automobile infringes.

It is claimed that the opinion of Judge Coxe shows that he held the Selden patent to be a pioneer patent, and its language, at first reading, seems to tend to sustain that claim; but I think that the opinion of Judge Coxe should be read in the light of the real question before him, and I cannot see how the question of the absolute validity or invalidity of a patent can be determined upon a demurrer which is based simply upon the claim that the patent is void on its face. If the patent shows on its face that it is void, that fact may be determined upon a demurrer; but it seems to me that a decision upon such a demurrer upholding a patent cannot be conclusive on any defense which depends on extraneous proof, as, for instance, anticipation by earlier patents, or by inventions described in earlier publications, or by prior use, or any of the many defenses which may be set up to the validity of a patent which are not apparent on its face. I therefore cannot see how the decision of Judge Coxe upon the demurrer establishes conclusively that this patent is either a pioneer patent, or is valid, and admittedly there has been no decision rendered after a hearing upon the merits on proofs taken. Moreover, there are facts in this case which support the suggestion that the complainants have hesitated to bring such a question to actual decision.

The patent was applied for in 1879. It was granted sixteen years later, in 1895. Nearly thirteen years have since passed, during which the complainants have asserted that they had a pioneer patent, and have caused many persons to take out licenses from them, and have collected, according to the motion papers, about \$1,500,000 for license fees, without bringing to actual trial a case testing the question of the validity of this patent on the merits. Several such cases have been brought. One was a case against the Winton Carriage Company, in which the complainants took their prima facie proofs, and the defendant had nearly completed its proofs, when the case was compromised, and settled out of court. As early as 1903 suits were brought by the complainants against the Ford Motor Company and the O. J. Gude Company, for the infringement of the Selden patent, and as early as 1906 suits were brought by the complainants against the Panhard Company. In all these suits defenses were interposed on the merits, but the testimony never has been completed, and the cases never brought to a hearing.

The claim put forth upon this motion is that the Selden patent is a pioneer patent, and that all makers of gasoline automobiles of the usual types infringe the patent. So serious a claim as this ought not to be upheld by the courts unless the complainants either have established the validity of the patents in a contested litigation, or have been ready to do so without delay whenever an opportunity has been offered.

If this motion is granted, it will be urged, as the decision of Judge Coxe on the demurrer has been urged, as an adjudication that the Selden patent is a pioneer patent, and that all makers of

gasoline automobiles must have a license. I think, on the papers submitted, that there is sufficient doubt whether the Selden patent is a pioneer patent, and that, if it is not a pioneer patent, there is sufficient doubt whether the Allen-Kingston automobile infringes, to make it improper to grant this motion.

My conclusion, therefore, is that the motion to punish the defendants for contempt should be denied.

February 15, 1908.

The counsel for the Association of Licensed Automobile Manufacturers were Betts, Sheffield, Bentley and Betts (Samuel R. Betts, William A. Redding), and James J. Cosgrove, of counsel, while the lawyers for the defendants were the firm of Nathan Bijur and George H. Engelhard, with R. A. Parker, of counsel.

ALBANY'S AUTO LEGISLATIVE GRIST.

ALBANY, N. Y., Feb. 24.—During the past week motor vehicle legislation was one of the foremost topics considered by the legislators. There was a hearing before the general laws committee on all the bills before that committee, at which Attorney Charles T. Terry appeared for the A. A. A. Legislative Board, and Attorney M. Bender of Albany for the State association. They argued against the Donihee bill to require a special form of auto lamp which should be so shaded as to prevent the escape of any upward rays and against the Northrup bill to tax auto owners \$5 each as a sort of road tax in addition to the registration fee. Neither bill was reported.

But the Weimert bill, to give garage keepers a lien on motor vehicles cared for when the owners fail to pay bills for keep, repairs, or supplies, was not objected to and, after being perfected by a slight amendment to include gasoline in the supplies, was reported for reprinting and to take its place on second reading.

The Wainwright bill, authorizing boards of supervisors to enact laws requiring all vehicles using the highways at nights to display lights, if not already so required by other laws, will be given a hearing Tuesday by the Assembly internal affairs committee.
